Leavenworth, fourth largest city of Kansas, and capital of Leavenworth county, on the Missouri River, 25 miles NW. of Kansas City by rail. First settled in 1854, it is now a handsome town, of broad avenues, and contains a Soldiers' Home, the state normal school, and large factories and mills. Eight lines of railway centre here, and the river is crossed by a fine iron bridge. Adjoining the city is Fort Leavenworth (1827), an important depot for troops and supplies, with large barracks, &c. Pop. (1880) 16,550; (1890) 19,768.

Leaves. See LEAF.

Lebanon, a mountain-range in Syria, extending from the latitude of Homs in the north (31° 43' N.) to that of Mount Hermon (33° 24' N.) in the south. The word Lebanon is derived from a Semitic root meaning 'white;' and this name is given to the mountains, not because their peaks are covered with snow (as they are even in summer), but because of the whitish colour of their rocks. The mountains belong geologically to the Cretaceous system, and consist principally of limestones and chalks. They are divided into two parallel ranges, the Lebanon on the west and the Anti-Lebanon (or more correctly Anti Libanus) on the east. Between them lies the deep valley of the Beka'a (the ancient Cole Syria), which is from 4 to 6 miles wide, and is watered by the rivers Litany and El-Asi (the ancient Orontes). The former flows south-westwards, then, turning abruptly to the west, reaches the sea a little north of Tyre; whilst the latter flows in the opposite direction, and, after crossing the plains of Hamath, likewise turns to the west to the Mediterranean. The highest summits occur in the north in both ranges, but are higher in Lebanon than in Anti-Lebanon; in the former they vary from 10,018 (El-Kazib) to 7000 feet and less, and in the latter are about 8000 or 9000 feet. In both ranges the eastern versant is the steeper and sterner. The western slopes of Lebanon are broken by numerous deep transverse valleys, running between the spurs that the main chain sends down to the very edge of the sea, where they often terminate in bold headlands. The western slopes of Anti-Lebanon are not so much cut up by valleys as those of Lebanon, but are more barren and more broken by crags and bare rocks. The valleys and the lower slopes of

the hills are generally verdant with vegetation. The vine is extensively grown, and wine is made, but is all consumed at home. Mulberry-trees figure prominently; for the manufacture of silk is one of the most important industries of the mountaineers—it was introduced from China in Justinian's time. Olive-groves and orchards (nuts and figs) abound everywhere. The higher slopes are in many districts covered with forests of oak, cypress, pine, plane, &c. Contrary to the current belief, remains of the great cedar forest of Solomon's time exist in more places than the single grove of 377 trees at the head of Kedisha Valley (see CEDAR). Thickets of low scrubby bushes, generally thorny, and often aromatic, are found at nearly all altitudes. Tobacco, wheat, barley, and millet are the chief crops cultivated. Owing to the elevated situation, the climate is healthy and bracing. Streams of clear water are numerous. The inhabitants (estimated at 221,000 in all) are a hardy, ruddy race of people, of Syrian (Aramean) descent, who keep large herds of sheep and goats. The predominating element is the Maronites (q.v.), more than two-thirds the total; next come the Druses (q.v.). Besides these there are Mohammedans, members of the Greek Church, Metawilé (a sect of Shiite Moslems), and a few converts of the American Protestant and the Roman Catholic missionaries of Beyrout. After the bloody quarrels of the Druses and Maronites in 1860, the district of Lebanon was separated (1861) from the Turkish pashalik of Syria, and put under a Christian governor, the European powers constituting themselves the 'guardians' of the new province. See Conder's *Palestine* (1889) and Baedeker's *Palestine* by Dr A. Socin.

Lebedin, a town of Russia, 87 miles NW. of Kharkoff. Pop. 14,788.

Lebrija (anc. *Nebriſsa-Fenicia*), a town of Spain, 44 miles by rail S. by W. from Seville. Pop. 12,864.

Le Brun, CHARLES, French historical painter, born in Paris, 24th February 1619. He was patronised in his youth by Nicolas Poussin, who took him to Rome, where he was kindly treated by the Barberini, and studied for four years. He then returned to Paris, and was employed by Fouquet on his château of Vaux, and afterwards by Cardinal Mazarin, Anne of Austria, and Louis XIV. He was the first director of the Gobelins Tapestry Works on its foundation by Colbert in 1662. For nearly forty years (1647-83) Le Brun exercised an immense and despotic influence over French art and artists, and is usually considered the founder of the French school of painting, Poussin being rather an Italian than a French artist. From 1668 to 1683 Le Brun was employed by Louis XIV., and given an absolutely free hand in the direction and management of the decoration of the palace of Versailles; but Mignard being favoured by Louvois on his accession to power, and the younger artist consulted by the king as to the completion of the work, Le Brun, who could brook no rival, retired, sickened, and died, 12th February 1690. See works by Genevay (1885) and Jouin (1889).

Le Brun, MARIE, born in Paris, 16th April 1755, was a daughter of one Vigée, a painter of little note, and in 1776 married J. B. P. Le Brun, a picture-dealer and grand-nephew of Charles Le Brun. Her great beauty, as well as the charm of her painting, speedily made her the fashion in Paris and at Versailles. 'Le Brun de la beauté le peintre et le modèle' was the friend of La Harpe and D'Alembert, copied Greuze, and painted all the fine ladies and gentlemen of the day. Her first portrait of Marie Antoinette (in 1779) led to a

lasting friendship with the queen of France. She subsequently painted numerous portraits of various members of the royal family, and in 1783 was admitted, on the proposition of Joseph Vernet—though after much opposition on account of her sex—a member of the Royal Academy of Painting. She became more than ever the fashion, but left Paris for Italy at the outbreak of the Revolution in 1789, and after a species of triumphal progress through Europe, being admitted a member of the principal academies of painting, including that of St Petersburg, she arrived in London in 1802. There she painted portraits of the Prince of Wales, Lord Byron, and other celebrities. In 1805 she returned to Paris, where she lived until her death (30th March 1842), and where her *salon* was ever the resort of artists, amateurs, and people of fashion. Of unblemished character, of great industry, and of immense charm both of manner and of personal appearance, Madame Vigée Le Brun enjoyed a life-long popularity. Her drawing is correct, her imagination moderate, her colouring delicate, graceful, and pleasing. Her delightful portrait of herself, gay and smiling, now in the Uffizi gallery at Florence, is well known. Many of her best works are in the Louvre gallery in Paris. See her *Souvenirs* (3 vols. 1837), a work illustrated with 662 portraits and 200 landscapes, chiefly taken in England and Switzerland.

Lecece (formerly called TERRA DI OTRANTO), a town of Southern Italy, 7 miles from the Adriatic and 24 by rail SSE. of Brindisi. As Lycia (hence Lecece) it was the seat of a countship in Norman times. Here tobacco, cotton, woollens, and linen are manufactured, and there is a large trade in olive-oil and wine. Lecece has a cathedral and numerous churches, one—St Nicholas—dating from the 12th century. Pop. 22,051.

Lech, a right-hand tributary of the Danube, rises in the Alps in Vorarlberg, flows northward past Augsburg, and after a course of 177 miles joins the Danube a few miles east of Donauwörth. It is a mountain-stream and not navigable. Near Rain, not far from its mouth, the imperialist general Tilly was defeated and killed on 5th April 1632 by the Swedes under Gustavus Adolphus.

Lechler, GOTTFHARD VICTOR, theologian, was born at Kloster Reichenbach in Würtemberg, 18th April 1811, and after various preferments came to Leipzig in 1858 as professor of Theology. There he died 26th December 1888. His first book was a history of English Deism (1841). *The Apostolate and Post-apostolic Times* (1851; 3d ed. 1885) was translated into English in 1886, and *John Wesley and his English Precursors* (1873), by Lorimer, in 1878. He also wrote a history of presbyterian and synodal church organisation (1854), and, with Gerok, a Commentary on Acts (Eng. trans. 1879).

Lecky, WILLIAM EDWARD HARTPOLE, a historian and philosopher, was born near Dublin, March 26, 1838, and educated there at Trinity College, where he graduated B.A. in 1859 and M.A. in 1863. Already in 1861 he had published anonymously *The Leaders of Public Opinion in Ireland*, four brilliant essays on Swift, Flood, Grattan, and O'Connell. Later works were his learned, luminous, and dispassionate *History of the Rise and Influence of the Spirit of Rationalism in Europe* (2 vols. 1865), *History of European Morals from Augustus to Charlemagne* (2 vols. 1869), and *History of England in the Eighteenth Century* (8 vols. 1878-90). The last is not a history in strict chronological form, but rather a philosophical study of events and their causes, relieved by an admirable series of finished historical portraits. Perhaps the ablest and most original portion of the work is the treatment of the American war of independence;

the pages on Ireland are very valuable. A volume of poems (1891) hardly raised his reputation. *Democracy and Liberty* (1896) is anti-Radical in tone. Lecky, who throughout the Home-Rule controversy was a decided Unionist, was elected M.P. for Dublin University in 1895.

Leclair, EDMÉ JEAN, was born at Aisy-sur-Armançon, 100 miles S.E. of Paris, 14th May 1801. First engaged in farm work, and afterwards as a mason's apprentice, he started for Paris, where he arrived friendless and penniless, and apprenticed himself to a house-painter. He proved a capable and industrious workman, and in his twenty-sixth year began business on his own account. By energy and by doing good work he soon secured a large business and took the front rank in the trade. His desire to benefit his workmen and do away with the existing antagonism between employer and employed led him to take M. Frégier's advice, and allow the workmen to participate in the profits of the master. Besides, he compelled people to be honest by issuing pamphlets exposing the tricks of the painting trade by means of which bad and scamped work was passed off for good. He also discovered a method of utilising white of zinc, instead of white of lead, much to the benefit of the workmen's health. His system of Profit-sharing (q.v.), which worked most successfully, was begun in 1842. He died 13th July 1872.

Le Clerc, JOHN, better known as JOHANNES CLERICUS, a Reformed theologian of somewhat free opinions, was born at Geneva, 19th March 1657, made his studies there in philosophy and theology, next repaired to Grenoble, Saumur, Paris, and London, gradually adopted the Remonstrant theology, and became in 1684 professor of Philosophy in the Remonstrant seminary at Amsterdam. In 1728 a stroke of apoplexy robbed him of speech; he died on 8th January 1736. His works were over seventy in number, many of a polemical character. In his controversy with Richard Simon he revealed opinions which were startling then, however innocent now, on the composition and Mosaic authorship of the Pentateuch, and on inspiration generally, and especially as applied to Job, Proverbs, Ecclesiastes, and Canticles. His commentaries on the Bible began with Genesis in 1693, and were not completed till 1731. Another important contribution to its subject was his edition of the Apostolic Fathers of Cotelerius (1698). No less valuable were his serial publications—*Bibliothèque Universelle et Historique* (25 vols. 1686-93), *Bibliothèque Choisie* (28 vols. 1703-13), and *Bibliothèque Ancienne et Moderne* (29 vols. 1714-26).

Lecluse. See CLUSIA.

Lecoq, ALEXANDRE CHARLES, composer of comic operas, was born at Paris, 3d June 1832, and trained at the Conservatoire. From his first successful opera, *Le Docteur Miracle* (1857), he shows Offenbach's influence and tendency. His best known works are *La Fille de Madame Angot* (1872), *Giocofa-Giocofa* (1874), *Le Petit Duc* (1877).

Leconte de Lisle, CHARLES MARIE, a great French poet, was born on the island of Réunion, October 23, 1818. He was carefully educated, and after some years of travel settled to a literary life in Paris. His early enthusiasm for Fourier's dreams soon disappeared before the wisdom learned of experience, but his ardent temperament found a more lasting poetic impulse in Greek ideals and in the sympathetic study of oriental pantheism. He succeeded to Victor Hugo's chair at the Academy in 1886. Besides his original poems he translated Theocritus, Anacreon, the *Iliad* and *Odyssey*, Hesiod, the *Orphic Hymns*, Æschylus, Horace, Sophocles, and Euripides. His *Poèmes*

Antiques (1852) and *Poésies Nouvelles* (1854) he collected as *Poésies Complètes* (1858). Other volumes are *Poésies Barbares* (1862), *Poésies Teu-tyques* (1884), *Derniers Poésies* (1895). He died 17th July 1894. He exercised a profound influence on all the younger poets of his time, and was head of a school called, from their organ, 'Les Parnassiens.' He has a great power of sympathy with the dumb emotion in the life of nature, the vaster aspects of which—the virgin forest, the immense sea, the profound sky—the reader ever feels the presence of, like the ground-plan on which his poetic phantasies are built. He stands aloof from, yet comprehends, the hot emotions that perplex the heart of man, and surveys the drama of the ages not with the eye of a Michelet or a Hugo, but with the calm, unimpassioned intuition of pure intellect. His versification is marked by classic regularity and by serene faultlessness of form.

See the admirable essays by Paul Bourget in *Nouveaux Essais de Psychologie Contemporaine*, and Jules Lenaitre in the first series of *Les Contemporains*.

Lecouvreur, ADELIENNE, actress, was born near Chalons, 5th April 1692, made her debut at the Comédie Française in 1717, and soon became famous for her power as an actress, her fascinations, and the number and eminence of her admirers, amongst whom were Marshal Saxe, Voltaire, and Lord Peterborough. Her death, 20th March 1730, was ascribed to poison administered by a rival, the Duchess Bonillon. This is the plot of the play by Scille and Legouvé, in which Rachel, Sarah Bernhardt, and others have won distinction. See her *Lectures*, edited by Monval (1892).

Lectern (Lat. *lectorium* or *lectricium*), a reading-desk or stand, properly movable, from which the Scripture lessons (*lectiones*), which form portion of the various church-services, are chanted or read. The lectern is of very ancient use, of various forms, and of different materials. The most ancient lecterns are of wood, a beautiful example of which is that of Ramsay Church, Huntingdonshire (about 1450), represented in the woodcut; but they were frequently also made of brass, and often in the form of an eagle (the symbol of St. John the Evangelist), the outspread wings of which form the frame supporting the volume. Sometimes a pelican in her piety takes the place of an eagle.

Lectern.

Lectinary. See LESSONS.

Lectures. At most British universities, lectureships have been endowed for the perpetual dissemination of opinions favoured by the founder; and to these, which were originally almost always of a theological or religious kind, have lately been added some of a wider interest, embracing science, philosophy, archaeology, history, and the like. Among theological lectureships in England of greater or less antiquity are the Bampton, delivered at Oxford; the Hulsean, at Cambridge; the Boyle, at London; the Warburtonian, at Lincoln's Inn;

the Congregational Union lectures, instituted in 1873 in continuation of the former Congregational lectures; and the Hibbert (in comparative religion), at Oxford and London. The Donnellan lectures are given at Dublin; the Baird, Croall, and Cunningham lectures, at Edinburgh. The Fernley lecturers follow the place of meeting of the Wesleyan Methodist Conference. Courses of Gifford lectures on natural religion are delivered at all the Scotch universities, while the Barnett lectures—hardly now to be recognised as identical with the original foundation—are connected with Aberdeen. At Cambridge are the Rede lecture and the Clark lectures in English literature; at Edinburgh, the Rhind in archaeology; while the chief towns in Scotland are visited by the Combe lecturers on physiology, and peripatetic Unitarians of the McQuaker foundation. Distinct from these are such professorships for a fixed period as those of poetry and art at Oxford; the endowed readerships, as in ancient history and the like, at the universities; the courses of lectures given at the Royal Institution or the Edinburgh Philosophical Institution; or endowments for special purposes, as the Harvey, Croonian, and Plumian orations. The Lowell Institute at Boston provides annual courses of free public lectures on religion, science, and the arts, and since its foundation (1839-40) has found audience for many distinguished English as well as American lecturers. See separate articles on the more important of the above lectures.

Lecythidaceæ, a natural order of exogenous plants, or sub-order of Myrtaceæ, the distinguishing characteristic being that the fruit is a large woody capsule, with a number of cells, which in some species remains closed, and in some opens with a lid. All the known species, about forty, are natives of the hottest parts of South America. Brazil Nuts (q.v.) and Sapucaia Nuts (q.v.) are the seeds of trees of this order. The Cannon-ball Tree (q.v.) belongs to it.

Leda, in Greek Mythology, the wife of the Spartan king Tyndareus, whom Jupiter visited in the disguise of a swan. The commonest legend makes her the mother of both Castor and Pollux (q.v.) by the god. The story has supplied a theme for many works of art.

Ledbury, a pleasant, old-fashioned market-town of Herefordshire, 13 miles ESE. of Hereford. It has an interesting church, Romanesque to Perpendicular in style, St. Catharine's Hospital (1232; rebuilt 1822), and a clock-tower (1890) to the memory of Mrs. Browning (q.v.). Pop. of parish (1851) 4264; (1891) 4303.

Ledru-Rollin, ALEXANDRE AUGUSTE, 'the tribune of the revolution of February (1848), as Louis Blanc was its apostle and Lamartine its orator' (Victor Hugo), was born in the house of Scarron at Fontenay, near Paris, 2d February 1807. Admitted to the bar in 1830, he made a name as defender of Republican journalists and men of like views during the reign of Louis-Philippe, and subsequently obtained a great reputation as a democratic agitator and leader of the working-men's party. He was elected in 1841 deputy for Le Mans, and sat of course on the extreme Left. Visiting Ireland at the height of O'Connell's agitation for repeal of the Union, he was present at several of the Liberator's monster meetings, and at Tara was hailed as a delegate from France. In 1846 he published an *Appel aux Travailleurs*, in which he declared 'universal suffrage' to be the only panacea for the miseries of the working-classes. He was an active promoter of the reform-meetings that preceded the commotions of 1848. On the outbreak of the revolution he became a member of the Provisional Government, as minister

of the Interior, and in May was elected one of the five in whose hands the Constituent Assembly placed the interim government. But he offended his supporters, his colleagues, and the moderates by his arbitrary and injudicious conduct, and resigned his portfolio on 28th June. He next ventured on a candidature for the presidency against Louis Napoleon in December, but was ignominiously beaten. An unsuccessful attempt to provoke an insurrection against his fortunate rival, on 13th June 1849, put an end to his political activity and his influence. He fled to England, where he became one of the leaders of the party who sought to control from one centre the democratic agitations throughout Europe, and so give unity and consistency of purpose to their efforts; and he signed the manifestoes of the revolutionary committee along with Kossuth, Mazzini, and Ruge. But in less than a year he published a passionate invective against the land which had given him an asylum. *De la Décadence de l'Angleterre*. For the next twenty years he lived alternately in London and Brussels, being only amnestied in 1870. After his return to France he was elected to the Assembly in 1871, and again in 1874. He died on 31st December 1874, at Fontenay. His *Discours Politiques et Ecrits Divers* appeared in 2 vols. 1879.

Leduc. See VIOLLET-LE-DUC.

Ledum, a genus of plants of the order Ericaceæ, sub-order Rhodoreæ, consisting of small evergreen shrubs, with comparatively large flowers, of which the corolla is cut into five deep petal-like segments. The species are natives of Europe and North America; some of them are common to both. The leaves of *L. latifolium* are said to be used in Labrador as a substitute for tea, whence it is sometimes called Labrador Tea. Sir John Franklin and his party, in the arctic expedition of 1819-22, used in the same way the *Ledum palustre*, which produced a beverage with a smell resembling rhubarb, yet they found it refreshing. The leaves of both these shrubs possess narcotic properties, and render beer heady. They are regarded as useful in agues, dysentery, and diarrhoea.

Lee, ANN. See SHAKERS.

Lee, FREDERIC RICHARD, an English landscape-painter, was born at Barnstaple, Devonshire, in June 1798, and chose the army for his profession. But being obliged by ill-health to quit it, he turned his attention to painting (1818) and was a constant exhibitor at the Royal Academy from 1824 till 1870. He was elected an A.R.A. in 1834 and R.A. in 1838, retiring in 1871. Lee was one of the most thoroughly national painters of his day, the river scenery, parks, leafy lanes, and picturesque villages of his native country forming the favourite subjects of his pencil. He died in Cape Colony, 4th June 1879.

Lee, ROBERT, D.D., was born at Tweedmouth, 11th November 1804, and educated at Berwick (where he was also for a time a boat-builder) and St Andrews. In 1833 he became minister of a chapel of ease at Arbroath; in 1836 he was transferred to Campsie, and in 1843, after the Disruption, to the vacant charge of Old Greyfriars, Edinburgh. In 1846 he was appointed also professor of Biblical Criticism in Edinburgh University, dean of the Chapel Royal, and one of the Queen's chaplains. In 1844 he received his doctorate from St Andrews. In 1857 he began his reform of the Presbyterian church-service. He restored the reading of prayers, as well as the custom of kneeling at prayer and standing during the singing; and in 1863 he introduced a harmonium, in 1865 an organ, into his church. These 'innovations' brought down upon him bitter and harassing attacks, extending over many years; and 'the

Greyfriars case' was still pending before the General Assembly when, on 22d May 1867, Lee fell from his horse in Princes Street, struck with paralysis. He died at Torquay, 14th March 1868.

His works include a *Handbook of Devotion, Prayers for Public Worship* (3d ed. 1863), a *Reference Bible* (1854), *The Family and its Duties* (1863), and *The Reform of the Church* (1864). See *Life* by R. H. Story (2 vols. 1870).

Lee, ROBERT EDWARD, was fifth in descent from Richard Lee of Shropshire, England, who emigrated to Virginia in the reign of Charles I. The ancestor of the Lee family in Virginia received large grants of land located between the Potomac and Rappahannock rivers, known as the Northern Neck, and here he built the original Stratford House, which was burned some years after. In the later edifice, erected by his grandson, Thomas Lee of Stratford, were born the distinguished brothers, Richard Henry Lee (1732-94), mover of the resolution in favour of American Independence and a signer of the Declaration; Francis Lightfoot Lee (1734-97), a signer of the Declaration; and William (1737-95) and Arthur Lee (1740-92), diplomatists. There also, on 19th January 1807, was born the subject of this sketch, the son of General Henry Lee, a cousin of the preceding. At the age of eleven he lost his father, and at eighteen he entered the Military Academy at West Point. He graduated second in his class in 1829, and received a second-lieutenant's commission in the engineers. In 1832 he married Mary Custis, daughter of George Washington Parke Custis, adopted son of George Washington, and grandson of his wife by her first marriage. He became first-lieutenant in 1836, and captain in 1838. At the beginning of the Mexican war in 1846 he was appointed chief-engineer of the central army in Mexico. General Winfield Scott praised him highly in official reports for his services at the siege of Vera Cruz. At the storming of Chapultepec he was severely wounded, and for meritorious services received his third brevet promotion in rank. In 1852 Colonel Lee was in command of the United States Military Academy, and in the three years of his administration greatly improved its efficiency as a training school for officers. His next service was as an officer of cavalry on the Texan border in 1855-59. When on a furlough in October 1859, the time of the John Brown raid, he was put in command of a small force and ordered to Harper's Ferry to capture the insurgents. Colonel Lee was in command of the department of Texas in 1860, but was recalled to Washington early in 1861 when the 'irrepressible conflict' between the free and the slave states seemed imminent. When Lee reached the capital in March 1861, seven states had passed ordinances of secession from the Union, and had formed the Southern Confederacy. Virginia seceded from the Union on April 17, and Colonel Lee, believing that his supreme political allegiance was due to his state rather than to the Union, felt compelled to send his resignation to General Scott, which he did on the 20th of April. The bitter struggle between his personal preferences and his high sense of duty is shown in the words of his wife, written to a friend at the time. 'My husband has wept tears of blood over this terrible war; but he must as a man and a Virginian share the destiny of his state, which has solemnly pronounced for independence.' Within two days after his resignation from the United States army he was made commander-in-chief of the military and naval forces of Virginia.

General Lee was devoutly religious, and a life-

long member of the Protestant Episcopal Church. His purpose to draw his sword only in defence of his native state was modified by its joining the Southern Confederacy, and the change of the capital from Montgomery, Alabama, to Richmond, Virginia. When the Confederate Congress met in Richmond, with representatives from eleven states, in May 1861, five brigadier-generals were appointed, of whom Lee ranked third. He had at first no active command, but remained at Richmond to superintend the defences of the city till the autumn, when he was sent to oppose General Rosecrans in West Virginia. In the spring of 1862 he was sent to supervise the coast defences of Georgia and South Carolina; but when McClellan's 'on to Richmond' advance with 100,000 men was assured, Lee was summoned to the capital. General Joseph E. Johnston, chief in command, was disabled by a wound at the battle of Seven Pines, May 31, 1862, and Lee was put in command of the army around Richmond. The masterly strategy displayed by Lee, and the desperate fighting of his army in the famous seven days' battles around Richmond, defeated the purposes of McClellan's Peninsular campaign, and belong rather to the history of the war than to personal biography. The same may be said of his battles and strategy in opposing General Pope's movements, his invasion of Maryland and Pennsylvania, and other prominent events of the war. The increasing resources of the North and the decreasing resources of the South could only result in the final success of the former. It was no news to Lee to be told of 'the hopelessness of further resistance' by General Grant in his note of April 7, 1865, and the common desire of both commanders 'to avoid useless effusion of blood' was creditable to both. On April 9, 1865, Lee surrendered his army of about 27,805 men to General Grant at Appomattox Courthouse, Virginia, and the four years' war was practically ended. That General Lee undertook ill-judged movements, as his advance into Pennsylvania, and that he trusted too much to his lieutenants in matters of importance, has been the opinion of some critics; and probably his unwillingness to throw blame on government officials who planned, and on subordinates to whom he entrusted the execution of the plans or parts of them, has given more apparent than deserved grounds for such criticisms. After the close of the war he frankly accepted the result, and although deprived of his former property at Arlington on the Potomac, and the White House on the Pamunkey, he declined proffered offers of pecuniary aid, and accepted the presidency of Washington College, since called the Washington and Lee University, at Lexington, Virginia. Here he devoted himself assiduously to the proper duties of a college president, gaining the affectionate esteem of the faculty and students as he had of the officers and soldiers of two armies in former years.

Exposure in the field in 1863 had resulted in rheumatic inflammation of the pericardium, which became more painful and frequent from exposure to cold or violent exercise, till a severe attack in 1869 greatly impaired his heart's action. From a second attack, in September 1870, he did not recover, but grew weaker till his death, October 12, 1870. His widow died in Lexington, Virginia, November 6, 1873. General Lee had three sons and four daughters. The eldest son, George Washington Custis Lee, graduated at the head of his class at West Point in 1851, resigned as first-lieutenant in the United States army in 1861, was an aide-de-camp to Jefferson Davis, 1861-63, major-general of a division of the army of northern Virginia in 1864, and successor of his father as president of the Washington and Lee University in 1871. William Henry Fitzhugh Lee, the second

son, was an officer in the United States army, and major-general of cavalry in the Confederate army. He was elected to the 50th and 51st congresses. Captain Robert E. Lee of the Confederate cavalry was the third son.

A bronze equestrian statue of General Lee, by Mercie of Paris, erected mainly by the women of the South, was unveiled in Richmond, Virginia, in 1890. The height of the whole structure, including an elaborate monumental pedestal, is 61 feet 2 inches, the equestrian figure being 22 feet 2 inches. See the *Life* by J. E. Cooke (1871), that by Long (1887), and that by his nephew, Fitzhugh Lee (1894).

Lee, SAMUEL, an English orientalist, was born, 14th May 1783, at Longnor, in Shropshire, studied at Queen's College, Cambridge, in 1819 was chosen professor of Arabic, and in 1831 regius professor of Hebrew, and died rector of Barley, in Hertfordshire, 16th December 1852. His reputation rests upon a *Grammar of the Hebrew Language* (1827); *Book of Job, translated from the Original Hebrew* (3 vols. 1837); *Hebrew, Chaldee, and English Lexicon* (1840); a translation from the Arabic of the *Travels of Ibn-Batuta* (1833) and from the Syriac of the *Theophrastus* of Eusebius (1843). He also wrote *Sermons on the Study of the Holy Scriptures* (1830), *Events and Times of the Visions of Daniel and St John* (1851), and an *Inquiry into Prophecy* (1849). He took charge, for the British and Foreign Bible Society, of editions of the Syriac Old Testament, the Syriac New Testament or Peshito, the Malay, Persian, and Hindustani Bibles, and the Psalms in Coptic and Arabic.

Leech, JOHN, humorous draughtsman, was born, of Irish descent, in London, 29th August 1817, his father, a cultured and excellent man, being landlord of the London Coffee House, Ludgate Hill. He was educated at the Charterhouse, where he was a fellow-pupil of Thackeray's, his friend throughout life, who at school was deemed the better caricaturist of the two, and who afterwards published an admirable estimate of Leech's art (*Quarterly Review*, December 1854). He next studied medicine and surgery, and during his attendance at St Bartholomew's Hospital his artistic skill found exercise in the production of anatomical drawings. Before long he adopted art as a profession, and at the age of eighteen published *Etchings and Sketchings, by A. Pen, Esq.* About 1838 he was contributing to *Bell's Life*; and in the fourth number of *Punch*, 7th August 1841, we find his first contribution to the journal with which his name is most closely associated, and with which he was connected till the time of his death. The cartoons which he designed for *Punch*, especially those dealing with incidents in the political life of Lord Brougham, Lord Palmerston, and Lord John Russell, and the powerful and terrible 'General Février turned Traitor,' are full of high qualities, and have been published separately. But even more delightful are the smaller woodcuts, drawn easily and freely, and dealing in gently humorous fashion with subjects of everyday life. In these, as it has been truly said, 'he has entered with genial sympathy into every phase of the many-sided English life of the hunting-field, the seaside, the ballroom, the drawing-room, and the nursery,' 'he has turned caricature into character, and left behind him not a little of the history of his time and its follies sketched with inimitable grace.' Various series of these designs have been collected in volumes entitled *Pictures of Life and Character from the Collection of Mr Punch*; and in 1862 a collection of them, enlarged by a mechanical process, and coloured by the artist himself in a combination of oil- and water-colours, was brought

together in the Egyptian Hall, London, and formed an exceptionally popular exhibition. In the intervals of work for *Punch* Leech contributed much to other journals and publications, including woodcuts in *Once a Week* (1859-62) and *The Illustrated London News* (1856), in *The Comic English and Latin Grammars* (1840), *Hood's Comic Annual* (1842), *Smith's Nassau Boat* (1843), *A Little Tour in Ireland* (1859); etchings in *Bentley's Miscellany* and *Terrill's Shilling Magazine*, in the Christmas books of Dickens, the *Comic History of England* (1847-48), the *Comic History of Rome* (1852), and the *Handley Cross* sporting novels; and also drew several lithographed series, of which *Portraits of the Children of the Mobility* (1841) is the most important. At length the artist's health began to suffer from incessant overproduction, he fell into a state of nervous irritability and prostration, and died at Kensington, 29th October 1864. See Dr John Brown's *John Leech* (1882), F. G. Kitton's *Biographical Sketch* (1883), and the *Life* by W. P. Frith, R.A. (1891).

Lee-Chee. See LITCHI.

Leeches (A.S. *læc*, 'a physician'; *Hirudina* or *Discophora*), a class of worm-like animals, usually suctional parasites, sometimes genuinely carnivorous. They are widely distributed in fresh and salt water, and occasionally on land. The body is extensible and ringed, but the superficial rings do not correspond to the true segments; no appendages are present, but there is a posterior attaching sucker, and the mouth is powerfully suctional; the body-cavity is almost obliterated by a spongy growth of connective tissue; the animals are hermaphrodite.

The Medicinal Leech (*Hirudo medicinalis*), formerly much used in blood-letting, has a slightly flattened body 2 or 3 inches in length, greenish black in colour, mottled on the under side, and with six rows of reddish and yellowish spots along the back. The skin is slimy and frequently casts its cuticle; there are 102 superficial skin-rings, with sense-spots on every fifth, while ten distinct eye-spots are borne on the head.

The Medicinal Leech (*Hirudo medicinalis*).

The animal is very muscular, moves rapidly by alternately fixing its oral and posterior suckers, and swims with graceful undulations. The mouth contains three semicircular 'saws,' each with eighty to ninety minute teeth of lime and chitine, by the saw-like action of which the leech gives its characteristic triadate bite. From animals thus bitten the leech sucks blood, and falls off when its many-pouches gut is gorged. A secretion from the pharynx seems to keep the blood from coagulating, and after a heavy meal the leech can fast and digest for a year. Its opportunities are in many circumstances few and far between, but it certainly makes the most of them. About the

leech's own blood, it is worth noting that it is coloured red with hæmoglobin. Leeches are at home in slow streams and in marshes, sometimes venturing ashore in search of victims higher than the insect larvae, fishes, and amphibians which they may hit upon in the water. The eggs are laid about June in the moist ground by the side of the water, and are enclosed in cocoons which are secreted from the skin. The growth of the young leech is slow, may continue in fact for four or five years, while the total length of life sometimes reaches a score. The medicinal species occurs in Britain, but is much commoner on the Continent. When the medical use of leeches, which is of ancient origin, was a constant practice, the swamps of western France were very important sources of supply. There the vampires were sometimes fed by driving old horses or cattle into the enclosures, and the primitive custom of wading in the water till the leeches fix on the bare legs is still practised by collectors. It is calculated that thirty millions used to be employed annually for medical purposes in France and England, but nowadays they have gone much out of fashion; yet a hatchery near Hildesheim still raises some 3½ millions annually. When kept by apothecaries they ought to be allowed free play in a closed glass aquarium with water-plants, instead of being huddled together in a dark vessel.

Leeching, or the application of leeches for the purpose of abstracting blood, is sometimes used instead of venesection, where general depletion is indicated, particularly in children; but much more often for the purpose of local depletion in localised inflammations. In the diseases of infants and young children, leeches must be applied with caution. In applying leeches the part should be thoroughly cleaned, and the leeches, after being dried by rubbing them in a clean linen cloth, should be placed in an open pill-box, or in a wine-glass, and applied to the spot at which it is desired that they should attach themselves. When it is wished to affix a leech to the inside of the mouth, it is placed in a narrow tube called a leech-glass. When the animals will not attach themselves readily they may sometimes be induced to bite by moistening the part with milk or blood. They usually drop off when filled; if they do not, they may be induced to do so by sprinkling them with common salt; they must never be pulled away. The quantity of blood which a leech is capable of drawing may be estimated on an average at about a drachm and a half, besides what flows from the wound after it has fallen off. It is usually desirable to promote to some extent this flow, which is readily done by the application of warm fomentations or poultices. The bleeding generally stops spontaneously after a short time; if it goes on longer than is desirable, the application of the fluff of a hat, or of a bit of cobweb, will usually check it. If these means fail, a little cone of lint should be inserted into the bite, over which a compress should be laid and a bandage applied; or the bite should be touched with a stick of nitrate of silver (lunar caustic) scraped to a point. Leeches, when applied to the mouth or interior of the nose, have been occasionally swallowed, and have given rise to very unpleasant symptoms. A moderately strong solution of common salt readily dislodges them. The 'artificial leech,' sometimes used, is a mechanical arrangement for producing a small freely-bleeding wound in the skin.

The Horse-leech (*Hirunopus sanguisuga*), whose 'daughters' (whether of this precise species or not) 'cry Give, give,' is common in Britain and elsewhere. It is about 4½ inches in length, feeds largely on earthworms, but has blunt teeth, and is not used medicinally. Another horse-leech is the

voracious *Anastoma*, which is carnivorous rather than parasitic. Among the numerous land-leeches which attack horses, cattle, and men, one of the most troublesome is *Hermodipsa erylonica*, graphically described by Sir James S. Tennent. It is only about an inch long and as thin as a knitting-needle, but it pursues its desired victims with considerable rapidity, and makes itself most irksome both to man and beast. So abundant are land-leeches in some warm and moist parts of the East

Horse Leech.

that soldiers and workmen are sometimes fatally weakened by the minute but persistent blood-letting. All the above and some other genera, such as the eight-eyed *Nepheleis* of our ponds, are called Gnathobdellidae, being usually provided with three tooth-plates, but without a 'proboscis.' In another set, Rhynchobdellidae, the forepart of the body is retractile and forms a proboscis. Here are included many interesting forms: the little fresh-water *Clepsine*, sometimes found with the young attached to the parent; the large, warty, marine *Pontobdella*, which fastens on rays; *Piscicola* on fresh-water fishes, such as perch and carp; and *Branchellion*, with numerous lateral leaflets of skin. The largest leech known is the South American *Macrobdella valdiviana*, a carnivorous form living in moist earth, and sometimes said to measure two feet and a half.

See C. O. Whitman in *Quart. Jour. Micr. Sci.* for 1886; Moquin-Tandon, *Monographie de la Famille des Hirudinées*, with Atlas (21 ed. 1846); Verill, *Fresh-water Leeches* (Washington, 1875).

Leeds, the first town in Yorkshire, and fifth in England in point of population, is a parliamentary and municipal borough, returning since 1885 five members to the House of Commons. By rail it is 25½ miles SW. of York, 196 N.W. of London, and 112 S.E. of Carlisle. It is situated in the north-west of the West Riding of Yorkshire, in the valley of the Aire, and is the seat of important manufactures, especially of clothing in all its branches. The ready-made clothing industry, especially, gives employment to more hands than anything else. The woollen trade carried on here, and in the surrounding towns and villages, exceeds in extent that of any other part of England. It has been estimated that general goods to the annual value of £11,000,000 pass through the warehouses in Leeds. The iron industries, which have been largely developed, employ about 30,000 persons, and are now as important as the woollen manufactures. The manufacture of leather is carried on in some of the largest tanneries in the kingdom, and about 100 firms are engaged in making boots and shoes. The other chief manufactures are those of loco-motives (both for rail and tramway), agricultural machines, glass, paper, tobacco, oil, chemicals, earthenware, worsted, and silk. Formerly flax-spinning was extensively carried on, but it is now fast dying out. It will thus be seen that Leeds depends for its prosperity not upon any one staple industry, but upon the great variety of its manufactured products. The goods traffic by rail, canal, and river is immense.

There are thirty-four churches in Leeds, eight Roman Catholic and about eighty dissenting places of worship. The chief church is St Peter's, which is in Kirkgate, and was rebuilt in 1838 at a cost of £29,770. It is 180 feet long by

86 wide; the tower is 139 feet high, and contains a peal of thirteen bells. The church also contains some fine monuments, one of which was erected in memory of those natives of Leeds who fell in the Crimea. The most interesting church in the town is St John's, New Briggate, consecrated by Archbishop Neile in 1634, an almost unique example of a 'Laudian' church, and still retaining the original fittings. The other principal buildings are chiefly of recent erection. The town-hall, completed in 1858, is 250 feet long, 200 feet broad, and the tower is 225 feet high. It covers 5600 square yards. The great hall is 161 feet long, 72 feet wide, and 75 feet high. It is richly decorated, and contains one of the largest and most powerful organs in Europe, besides statues of Edward Baines and Robert Hall, formerly members for the borough. There are also colossal statues of Queen Victoria and the Prince Consort in the vestibule, and of Wellington in the front of the building. Contiguous to the town-hall are the municipal buildings (comprising, besides the various corporate offices, reading-room, free library, and fine art gallery), and the school-board offices, the whole forming two handsome and substantial blocks of buildings.

The General Infirmary was erected in 1868 from designs by Sir G. G. Scott, at a cost of £120,000, and contains accommodation for 300 in-patients. The mechanics' institute, erected in 1867 at a cost of £25,000, contains a lecture-hall accommodating 1700 persons. The grammar-school, built in 1859, at a cost of £13,000, from designs by Barry, is a cruciform Decorated structure. Other buildings are the Coin Exchange, a handsome structure of an oval form; the new post-office (fronting the handsome City Square); the Yorkshire Penny Bank; Brown's Bank; the Coliseum, the most convenient public hall in the town; the Philosophical Hall, with a fine museum; the Wesleyan training-college, erected in 1868; Turkish Baths (cost £14,000); Beckett's Bank, a fine work by Sir G. G. Scott. There is also a library of 80,000 volumes, founded by Priestley in 1768. Among charitable institutions may be mentioned the Dispensary; Hospital for Women and Children; Tradesman's Benevolent Society; Industrial Schools; Convalescent Home; a handsome work-house; the Reformatory at Adel, where about sixty juvenile criminals are usefully employed in agricultural and other occupations. Leeds has also a Royal Exchange, which was opened in 1875, a Stock Exchange, two general markets—one of which is a handsome structure of iron and glass—a new cattle-market, white cloth hall, three terminal railway stations giving access to seven railway companies, eleven banks, and four theatres. The old coloured cloth hall was pulled down in 1889. The Yorkshire College, an important centre of higher education established in 1874, has now nearly forty professors and instructors in its two departments of science, technology, and arts and of medicine; it is affiliated to the Victoria University. A large and imposing pile of Gothic buildings was devoted to its use in 1885; the new School of Medicine, opened in 1891, cost £40,000. Some sixty Board schools, accommodating 65,000 children, have been erected since 1870, including the Central Higher Grade School for 2000 scholars, opened in 1889, and the Southern Higher Grade School. A complete system of tram lines radiates from the centre of the town to all the outlying suburbs, electricity (on the trolley system) being the motive-power. Kirkstall Abbey (q.v.) is about 3 miles from Leeds. Roundhay Park, 3 miles from Leeds, was bought by the corporation in 1872 at a cost of £140,000, and converted into a recreation ground for the

use of the public. Adel Church, about 4 miles from Leeds, was erected 1140. Near it have been found remains of a Roman station. Pop. (1851) 172,270; (1881) 309,112; (1891) pop. of borough—since 1888 a county borough—367,505. Since 1893 the mayor is styled Lord Mayor.

Amongst Leeds worthies are Dean Hook (q.v.), who was vicar of Leeds; Priestley, theologian and chemist; Cope and Rhodes, the artists; the Teales, physicians, &c.; besides the Becketts, the Baines's, the Gotts, the Fairbairns, the Denisons, the Kitsons, and other prominent families, which have been closely identified with the interests of the town, and whose members have been noted for their public spirit and philanthropy. Among the books on Leeds may be mentioned Ralph Thoresby's *Ducessus Leodienis*, or *Topography of Old Leeds* (1715); Baines's *Historic Sketch of Leeds* (1822); and Jackson's *Guide to Leeds* (1889).

Leeds. THOMAS OSBORNE, DUKE OF, better known in history as Earl of Danby, English statesman, was the son of a Yorkshire baronet, and was born in 1631. He entered parliament for York in 1661 as a warm supporter of the king and of the Established Church. He first held office in 1667 as an auditor of the Treasury; after that his promotion was rapid: in 1671 he was appointed Treasurer of the Navy, in 1673 Viscount Latimer and Baron Danby, and in 1674 Lord High Treasurer and Earl of Danby. He endeavoured to enforce the laws against Roman Catholics and Dissenters; and, though he disliked French aggression, and so far favoured the Dutch party that he effectively used his influence to get Princess Mary married to William of Orange in 1677, he lent himself to be the agent of Charles, and on his behalf negotiated with Louis XIV. for bribes to the English king. Louis, however, intrigued successfully for Danby's downfall: the Commons impeached him in 1678 on six different counts, the chief of which were treating traitorously with foreign powers without the consent of council, aiming at the introduction of arbitrary power, and squandering public money. He was not brought to trial, but kept in the Tower until 1683, although Charles gave him at once a full pardon. This the Commons refused to recognise, and, in spite of a dissolution, still persisted in the impeachment. Danby is chiefly remembered in history for the part he played at the revolution of 1688. When James began to threaten the Established Church Danby returned to active political life. He signed the invitation to William of Orange and secured York for him. His reward was a rise in rank from earl to marquis (of Carmarthen) and the presidency of the council, virtually the chief place in the government. But he again bribed as he had done during his first administration, and practised the same unscrupulous methods of government. He was created Duke of Leeds in 1694. But in 1695 he was impeached a second time, for having himself accepted 5000 guineas from the East India Company as the price of his influence in securing an extension of their chartered privileges. He again managed to stave off condemnation; but his power was now virtually gone, and in May 1699 he finally retired. After that his principal public appearance was to speak in defence of Sacheverell in 1710, when he stultified himself by condemning the principle of the revolution. He died at Easton, in Northamptonshire, on 26th July 1712. See *Life* by T. P. Courtenay (1838).

Leek (*Allium Porrum* of some; see ALLIUM), a biennial plant, believed now by many of the best authorities to be a cultivated variety of the British species *Allium Ampeloprasum*, a well-known biennial species of the Onion family, much esteemed

for culinary purposes. In gardens much attention is given to its cultivation. The more liberal the culture the more delicate and tender is the produce; therefore it is generally grown in trenches, which have a liberal supply of manure dug into them in the same way as celery. The stems are blanched by earthing up, which increases their delicacy. Scotland is famous for the splendid quality of its leeks, and Musselburgh is the centre in which the most approved kinds are grown for seed-saving. Seeds grown there have a special commercial value, which is due entirely to care, year after year, in selecting only the best types for the purpose of seed-saving. St David, patron saint of Wales, is credited with having advised the Britons, on the eve of a battle with the Saxons, to wear leeks in their caps, so as easily to distinguish friends from foes, and thus to have helped to secure a great victory. Hence the Welsh custom of wearing leeks in their hats on St David's Day. See Shakespeare's *Henry V.*

Leek, a manufacturing and market town of Staffordshire, on the Churnet, 13½ miles SSE. of Macclesfield, and 24 NNE. of Stafford. The parish church, dating from 1180, but mainly decorated in style, was restored by Street in 1867-75. There are also a grammar-school (1723), a cottage-hospital (1870), and, 1½ mile distant, the ruined Cistercian abbey (1214) of Dieulaeres (De la Croix). Leek manufactures sewing and embroidery silks, and is the chief English centre for dyeing silk (see SILK). The Nicholson Institute comprises a Free Library, and Art School, &c. Pop. (1851) 1877; (1891) 12,760. See Sleight's *History of Leek* (2d ed. 1884), M. H. Miller, *Old Leek* (Leek, 1891).

Leer, a commercial town and port on the Leda near where it enters the Ems, in the Prussian province of East Friesland, 32 miles NW. of Oldenburg. Pop. 10,399.

Leet. The court leet, in England, was a court of a manor, township, &c. for election of certain officers and trial of minor offences. The importance of these courts is now very small, but there are manors, &c. where they are regularly held.

Leeuwarden, capital of the Dutch province of Friesland, stands on the Harlingen and Groningen Canal, 113 miles by rail NNE. of Utrecht. It contains handsome law-courts and town-hall, has an ancient palace of the Princes of Orange, a library with valuable archives, and a dozen churches. Linen fabrics, mirrors, pianofortes, and wagons are manufactured. Leeuwarden is one of the largest fruit and cattle markets in Holland, and does considerable trade in agricultural produce, groceries, wine, and brandy. Pop. (1873) 27,108; (1896) 31,598. In the 13th century it was situated on an arm of the sea, which subsequently sanded up. See Havard, *Dead Cities of the Zuider Zee* (1876).

Leeuwenhoek, ANTON VAN, one of the most successful pioneer microscopists, was born at Delft on 24th October 1632, enthusiastically pursued microscopic work with self-made instruments in 1654, made many important discoveries, and died at Delft on 27th August 1723. He supplemented Harvey's discovery of the circulation of the blood by tracing the capillaries in the frog's foot, defined the red blood-corpuscles of Vertebrates, was the first to notice definitely what are now called unicellular organisms, and corroborated, though with erroneous interpretation, the discovery of male elements or spermatozoa by his student Ludwig Hamm. His investigations of minute structure led him to detect the fibres of the lens, the fibrils and striping of muscle, the structure of ivory and hair, the scales of the epidermis, the distinctive characters of Rotifers, and many interesting histo-

logical facts in regard to insects. Much of his time and attention was given to a long series of investigations into spontaneous generation, of which theory he was a decided opponent. In the course of these studies he ascertained and proved, amongst other results, that oak-galls are primarily caused by the development of an insect's egg deposited in the bark; that weevils are hatched, not *from* wheat, but from an insect's eggs deposited in wheat; that the flea is propagated in a similar manner to other insects, not originated from dust, or sand, or the dung of pigeons, as was commonly believed; that Aphides are viviparous; that oels, instead of being produced from dew, are likewise viviparous; and that muscels are not generated from mud or sand, but from spawn. He also extended his inquiries to the growth of trees, and showed the differences that exist in the structure of the stem of monocotyledons and dicotyledons. The greater part of his discoveries and investigations were described in papers (112) contributed to the *Philosophical Transactions* of the Royal Society and papers (26) printed in the *Memoirs of the Paris Academy of Sciences*, of both which bodies Leewenhook was a member. The most complete collection of his *Works* appeared at Leyden in 4 vols. in 1719-22. A selection of these was translated into English by S. Hoole (2 vols. Lond. 1798-1801). See the *Life in Dutch* by Haaxman (Leyden, 1875).

Leewin, CAPE, the south-west corner of Australia, notable on account of the tempestuous weather usually encountered there.

Leeward Islands. See ANTIGUA, WEST INDIES.

Lefebvre, FRANCOIS JOSEPH, Duke of Danzig and Marshal of France, was born at Ruffach, in Alsace, 25th October 1755. He entered the army at the age of eighteen, and was a sergeant in the French Guards when the Revolution broke out. He was engaged for some time on the Moselle and Rhine, fought at Flenrus, Altenkirchen, and Stockach, and rose in rank with wonderful rapidity. In 1799 he took part with Bonaparte in the overthrow of the Directory, and in 1804 was made a Marshal of the Empire. He also conducted the siege of Danzig, and after its capture was created Duke of Danzig. He distinguished himself in the early part of the Peninsular war, and suppressed the usurpation in the Tyrol. During the Russian campaign he had the command of the Imperial Guard, and in 1814 of the left wing of the army which resisted the advance of the allies in France. Submitting to the Bourbons after Napoleon's abdication, he was made a peer, a dignity restored to him in 1819, though he had sided with his old master during the Hundred Days. He died in Paris, 11th September 1820.

Lefkolia. See NICOSIA.

Lefort, FRANCOIS JACOB, favourite of Peter the Great, was born at Geneva in 1653, being descended from a family of Scottish extraction which had settled in Piedmont, afterwards (1585) in Switzerland. He served for a time with the Swiss Guard at Paris; but went to Russia in 1675, and attracted the notice of Prince Galizin, who made him a commander of the new troops raised to counteract the influence of the 'strelitzes' or old militia. Having taken a leading part in the intrigues which made Peter sole ruler after the death of his brother Ivan, Lefort was advanced to be first favourite of the czar, and next to him the most important personage in Russia. A man of great ability, Lefort backed up Peter in his projects of reform, remodelled the army and laid the foundation of the navy, and in 1694 was made admiral and generalissimo. When Peter undertook his visit to foreign countries in 1697 Lefort

was made chief of the embassy in the train of which the czar travelled *incognito*. He died 12th March 1699. See LIVES (in German) by Posselt (1866) and Blum (1867).

Left-handed. See RIGHT-HANDEDNESS; BRAIN, Vol. II, pp. 391, 392.

Leg, the lower limb, or, in the usage of anatomists, that part of the lower extremity which lies between the knee and the ankle. It consists of two bones, the Tibia and Fibula (see SKELETON, FOOT), and of masses of muscles (together with nerves and vessels) which are held in position by coverings of fascia, and are enveloped in the general integument. The shaft of the tibia is of a triangular prismoid form, and presents three surfaces and three borders. The internal surface is smooth, convex, and broader above than below; except at its upper third, it lies directly under the skin, and may be readily traced by the hand. The external and the posterior surfaces are covered by numerous muscles. The muscular mass forming the calf (formed by the *gastrocnemius*, *soleus*, and *plantaris* muscles) is peculiar to man, and is directly connected with his erect attitude and his ordinary mode of progression. The anterior border of the tibia, the most prominent of the three, is popularly known as the *shin*, and may be traced down to the inner ankle. The fibula, or small bone of the leg, lies on the outer surface of the tibia, and articulates with its upper and lower extremities, and with the astragalus inferiorly. It affords attachments to many of the muscles of this region.

This region is nourished by the anterior and posterior tibial arteries into which the popliteal artery divides. Both these arteries occasionally require to be tied by the surgeon in cases of wounds or aneurism. The blood is returned towards the heart by two sets of veins—the deep, which accompany the arteries, and the superficial, which are known as the internal or long saphenous, and the external or short saphenous veins. These superficial veins are very liable to become permanently dilated or varicose (see VARICOSE VEINS), if there is any impediment to the free transmission of the blood, or even from the mere weight of the ascending column of blood, in persons whose occupation requires continuous standing. The nerves of the leg, both sensory and motor, are derived from the great sciatic nerve and from its terminal branches, the internal popliteal and the external popliteal or peroneal nerve.

In cases of fracture or *broken leg* the two bones are more frequently broken together than singly, and the most common situation is at the lower third. What is known as Pott's fracture consists of fracture through the lower third of the fibula, with fracture of the projecting lower end of the tibia.

Ulceration of the leg is a frequent consequence of varicose veins, and the very condition which causes the veins to dilate (continuous standing) is an effectual preventative of the healing process, to ensure which complete rest, with the leg raised so as to assist the return of the blood, is necessary.

Bandy, or bow, leg is a condition which may appear as the result of muscular contraction before a child has been placed on its feet. In such a case the natural curve of the tibia is merely exaggerated. It is associated with Rickets (i.e. a deficiency of lime salts), in which the child has the habit of sitting tailor-wise, and thus bending the tibia forwards and outwards in its lower third. Sometimes one leg is bandy and the other is kneed. This is produced in a soft-boned child by the mother or nurse always carrying the child upon the same arm and using the other arm to clasp the child's legs across the front of her body. See FOOT, KNEE,

HIP-JOINT, CLUB-FOOT, ACHILLES TENDON, &c.; also AMPUTATION, ARTIFICIAL LIMBS.

Legacy is a bequest or gift of personal property by will. In England it is provided by the Will-Act of 1837 that if a legacy is given to the witness of a will, or to his or her wife or husband, the legacy is void; also bequests to superstitious uses are void, as, for example, to maintain a priest, or an anniversary or obit, or a lamp in a church, or to say masses for the testator's soul, or to circulate pamphlets inculcating the pope's supremacy. Legacies of money for charitable purposes, as for the use of schools, churches, &c., are valid, but if the money is directed to be laid out in the purchase of land for such purposes the legacy is void by what is called the Mortmain Acts (amended and consolidated by the Mortmain and Charitable Uses Act, 1888). Certain favoured institutions and charities are exempted from the operation of these acts.

Legacies are divided into *specific*, *general*, *demonstrative*, and *cumulative*. A *specific* legacy means a legacy of a definite thing, as a particular horse, picture, silver-plate, &c., or a sum of stock in the funds. A *general* legacy means a sum of money, without it being stated out of what fund it is to come, and it is payable out of the assets generally. The important difference between these two kinds of legacy is this, that if the subject-matter of the specific legacy fail, as if the horse die or be previously sold, &c. (ademption), the legacy is gone, and no compensation is given for it after payment of the testator's debts. But legacies given for valuable consideration do not suffer abatement; while, on the other hand, if there is not enough to pay all the general legacies, then they must abate—i.e. share the loss—whereas the specific legacy, if it exist, must still be paid in full. A *demonstrative* is something like a general legacy, but a particular fund is named from which it is to be satisfied. It is not liable to ademption by any act of the testator, nor is it liable to abatement with general legacies as long as it does not exceed the fund from which it is to be paid. A *cumulative* or *substitutional* is a second legacy given to the same person, and the question for settlement in that case is whether the later gift is in addition to or in place of the first. A legacy is not payable by the executor till a year has elapsed after the testator's death, for it is presumed he requires this time to inquire into the state of the property; and this is true even though the testator has ordered the legacy to be paid within six months after the death. If a legacy is left to an infant under twenty-one it cannot be paid to the father or any other relative without the sanction of the Court of Chancery. Formerly, if a legacy was left to a married woman the husband was entitled to claim it, unless it was left to her separate use, or unless she was unprovided for by the husband; but now in all cases the wife gets for her separate use all property coming to her. Interest is due on legacies from the time when the principal sum is payable—i.e. one year after the death unless otherwise specified. If the legatee die before the testator the legacy lapses—i.e. becomes void; but there are some exceptions, as where the legatee is a child or grandchild of the testator. A legacy to a creditor, if equal to or greater than the debt, is presumed to be in satisfaction thereof. If the estate from which a legacy is claimed do not exceed £500, an action to compel payment may be brought in the county court. The person to whom the remainder of the property is left after all claims are discharged is called the residuary legatee. In Scotland the rules as to legacies are mainly the same, but a verbal legacy up to £100 Scots (£8, 6s. 8d.) is valid. In Scotland a legacy can be enforced in six months

after the testator's death, and bears interest at 5 per cent. from such death. If a legacy is left to a married woman, the property in it vests in her; she can enjoy the income, but cannot dispose of the corpus without the concurrence of her husband.

In the United Kingdom, where the whole personal estate is under £100 there is no legacy duty, and for under £300 the fixed inventory duty of 30s. 'is deemed to be a full satisfaction of any claim to legacy duty.' In other cases the rate is inversely as the degree of relationship. The husband or wife of the testator pays no duty; the child or lineal descendant, a parent or lineal ancestor, pays 1 per cent.; a brother or sister, or their descendants, 3 per cent.; others, in proportion to their remoteness, 5 and 6 and 10 per cent. The last is in all cases the maximum rate. The royal family are exempt from legacy duty. See Jarman on *Wills*, and Williams on *Executors*.

Legal Fiction. See FICTION.

Legal Tender. See TENDER.

Legate, the name of the ambassador or representative, whether temporary or permanent, sent by the pope to a particular church. In the later constitution of the church three classes of legates are distinguished: (1) *Legati a latere*, 'legates despatched from the side' of the pontiff, who are commonly cardinals; (2) *Legati missi*, called also 'apostolic nuncios,' and including a lower grade called 'internuncios;'; (3) *Legati nati*, 'legates born,' whose office is not personal, but is attached by ancient institution or usage to the see or other ecclesiastical dignity which they hold. Of the last class there were examples in most national churches; thus, the Bishop of Thessalonica was legate born for Illyrium, the Bishop of Arles for Gaul, the Bishop of Mainz for Germany, the Bishop of Toledo (though his claim was often disputed) for Spain, the Archbishop of Canterbury for England, &c. This institution, however, has gone entirely into abeyance; and, indeed, the authority of legates is much modified in the modern church. In the medieval times the legate claimed full papal jurisdiction in the country assigned to him, even overruling the local jurisdiction of the bi-shops of the national church. This led to many disputes; to refusals to receive legates, as in France, where the legate was obliged to wait at Lyons till his credentials should have been examined and approved at court; and to counter legislation, as in England to the statute of 16 Richard II., commonly known as the Statute of Premunire. The Council of Trent removed the ground of contention by abolishing all such claims to local jurisdiction as trench upon the authority of the bishops. The legate, in the modern church, is little other than the ambassador, mainly for spiritual purposes, of the pope. He is held as belonging to the diplomatic body, and by the usage of Catholic courts enjoys precedence of all other ambassadors. The legates at the more important courts have the title of *nuncio*, at minor courts of *internuncio*. In 1890 there were apostolic nuncios at Vienna, Munich, Madrid, Paris, Lisbon; internuncios at the Hague and Rio Janeiro, and an apostolic delegate at Quito. In the States of the Church (q.v.) the governors of the Legations were called *legates*.

Legato (Ital., 'tied'), in Music, means that the passage is to be performed in a smooth manner, the notes being played as if bound or tied together, or in such a manner that the one note is as it were rounded off, or flows into the following one.

Legend, a name somewhat loosely applied on the one hand to the creations of mythology, and on the other to the more or less historical accretions that ever tend to grow around the names of heroes

who impress the popular imagination. Interesting examples of entirely baseless legends in their turn becoming historical may be seen under the names Pope Joan and William Tell. It is ever the fate of a great name to be enshrined in fable, and this fact afforded a basis for Strauss in his famous attempt to reconstruct the history of Christianity. The term legend was early applied to those religious traditions which, in the early days of Christianity, clustered round the gospel history; this tendency to mythic embellishment having further showed itself in connection with the later saints and martyrs. This curious practice of interweaving truth with fable no doubt arose from a credulous love of the wonderful, an exaggeration of fancy, and an ecclesiastical enthusiasm, at times even pious fraud helping to disseminate such embellished and unreliable narratives. But, intermixed with falsehood as these so-called legendary tales were, they gradually crept into the Eastern and Western Churches, and in the course of centuries gained an entrance into the national literature of Christian nations. Already the same process had made the *Talantol* the strange medley of sense and nonsense that it is. It should be added that, in the Roman Catholic Church, the lives of saints and martyrs were commonly known as *legends*, because chapters were to be read (*legenda*) out of them at matins and in the refectories of the religious houses. One of the best-known medieval collections is that known as the Golden Legend (q.v.). Capgrave's *Legenda Anglorum*, printed by Caxton in the 15th century, was a kind of precursor of the monumental *Acta Sanctorum* of the Bollandists (q.v.).

See the articles FOLKLORE and MYTHOLOGY. An admirable discussion of the ancient Greek heroic legends and their relation to mythology will be found in the first volume of Grote's history.

Legendre, ADRIEN MARIE, a very distinguished mathematician, was born at Toulouse in 1752. After studying at the Collège Mazarin in Paris he gained the attention of D'Alembert, and through him was appointed professor of Mathematics at the Military School. After several proofs that he had mastered the modern analysis, and especially on account of his memoir on the attraction of spheroids of revolution, Legendre was in 1783 chosen member of the Academy of Sciences. Appointed in 1787 one of the commissioners to connect Greenwich and Paris by triangulation, he was chosen member of the Royal Society of London. In his report Legendre gave the first enunciation of the 'proposition of spherical excess,' now considered an essential theorem of trigonometry, just as in 1806 he gave out the first proposal to use the 'method of least squares' in his *Nouvelles Méthodes pour la Détermination des Orbites des Comètes*. Under the empire Legendre was appointed honorary member of council for life, and member of the Commission of Public Instruction, having already been appointed to the Bureau des Longitudes and examiner at the Polytechnic. In 1827 appeared his *Traité des Fonctions Elliptiques*, a subject with which his name must remain permanently associated. He wrote several other mathematical treatises, some of the highest importance. His *Théorie des Nombres* (1830) is still a classical work and evinces much original power. His best known book is his *Éléments de Géométrie* (1794), which has been translated into many languages by Thomas Carlyle into English (1824). It is probably due to an attempt to supersede Euclid as a text book; and if so it is one of the most successful. Legendre died in Paris on 10th January 1833.

Legge, JAMES, an eminent Chinese scholar, was born at Huntly in Aberdeenshire in 1815, and was educated at King's College, Aberdeen, where he

graduated in 1835. He passed afterwards to High-bury Theological College, London, and went out to Malacca, arriving in December 1839, as a missionary to the Chinese in connection with the London Missionary Society. For some time he took charge of Dr R. Morrison's Anglo-Chinese college there; next laboured for thirty years at Hong-kong; and was appointed in 1876 to the newly-founded chair of the Chinese Language and Literature at Oxford with a Corpus Christi fellowship. His greatest works have been his editions of *Chinese Classics* and books about Confucius and Mencius (1862-93). The Confucian texts and Taoist texts form six vols. in the *Sacred Books of the East*. A Life of Confucius, the works of Mencius, and the *Shu-King* are separate publications. He published also a series of lectures on *The Religions of China* (1880), and wrote many important articles on Chinese matters, including the articles on China, Confucius, Lao-Tsze, Mencius, the Taipings, &c. in this work. He received the degree of D.D. from New York (1841), and of LL.D. from Aberdeen (1870) and Edinburgh (1884). Of the *Chinese Classics* (arranged in 7 vols.), a second ed. of vol. I. appeared in 1893. He died 29th November 1897.

Leghorn (Ital. *Livorno*) runs Naples very close for the rank of second busiest seaport of Italy (Genoa being the first); it is situated on the west coast, by rail 13 miles SW. of Pisa and 62 W. by S. of Florence. Its importance as a commercial emporium dates from the decline of Pisa; its growth was especially rapid after it fell into the hands of Florence in 1421, for the Medici princes encouraged its prosperity in every way. Cosimo I. declared it a free port, the first in the Mediterranean, and invited foreign traders to settle there, and there is still a large foreign element amongst its merchants. Early in the 19th century it was a great depot for the British trade with the Levant, but slowly lost this position after the 3d decade, because the British merchants began to send their goods to their destinations direct. Leghorn ceased to be a free port in 1868. At the present moment its foreign commerce, which is carried on chiefly with Britain (Newcastle and Cardiff), France (Marseilles), and the United States, is less in both bulk and value than its coasting trade, and since 1873 the former has been decreasing, whilst the latter has been increasing. The foreign commerce was carried on in 1885 '95 by a total of about 1000 vessels per annum, entered and cleared, of near 500,000 tons, whereas the home trade engaged 6000 vessels of 2,000,000 tons. The imports, principally spirits, sugar, dyeing materials, woven goods, corn and flour, and machinery, may have an annual value of over £2,000,000; the exports, embracing wine, silk, marble, olive-oil, boracic acid, hemp, iron, preserved fruits, leather, coral, and straw-hats ('Leghorn hats'; see STRAW), average £1,500,000 annually. The harbour (improved in 1854-63) is an enclosed basin, on which stand arsenals and shipbuilding yards. One yard employs 1200 men, and builds the great Italian ironclads. The roadstead is protected by an artificial breakwater, built in 1883, which shelters vessels against all winds except the southerly. There is a lighthouse (since 1303) between the harbour basin and this outer breakwater; and on the shore, outside the harbour, stands a lazaretto. Besides shipbuilding, the most important industry is the manufacture of coral ornaments, by some 6000 women who work in their own homes. The value of the coral ornaments exported has sunk, however, from upwards of £300,000 per annum to less than half that value, in consequence of the fall in the price of coral. The houses of Leghorn are for the most part modern and well built, lofty, and roomy; the streets are broad and clean; and there are some

fine squares adorned with statues of the grand-dukes of Tuscany. The north-western portion of the city is intersected by numerous canals; hence it is called 'New Venice.' The most interesting of the public buildings are the cathedral (17th century), its facade designed by Inigo Jones, the Jewish synagogue (ranking for size next in Europe to that of Amsterdam), the former grand-ducal palace (1695), &c. The Academy of Sciences, with a library of 40,000 volumes, and the naval academy deserve mention. The sulphur-springs and sea-bathing attract a large concourse of visitors in the season. Leghorn is defended both landwards and seawards by forts, bastions, and other fortifications, constructed for the most part in 1835-37. Smollett and Francis Homer lie buried in the cemetery of the English church. Pop. of the city (1861) 83,543; (1871) 80,948; (1881) 78,988; of the commune (1871) 97,096; (1881) 97,615; (1895) 104,500.

Legion, in the Roman military system, corresponded in force and organisation to what in modern times we should call a *corps d'armée*. It differed in constitution at different periods of Roman history. In the time of the republic a legion comprised 4500 men, thus divided: 1200 *hastati*, or inexperienced troops; 1200 *principes*, or well-trained soldiers; 1200 *velites*, or skirmishers; 600 *triarii*, or *pilani*, veterans forming a reserve; and 300 *equites*, knights who acted as cavalry, and belonged to families of rank. During this period the legions were formed only for the season; standing armies being of later growth. The *hastati*, *principes*, and *triarii* formed three separate lines, each divided into 10 *maniples* or companies, of 120 men each in the case of the two front lines, and of 60 men in the *triarii*. A *maniple* was commanded by a centurion or captain, who had a second-centurion, or lieutenant, and two sub-officers, or sergeants, under him; as non-commissioned officer there was a *decurion*, or corporal, to every squad or tent of ten men. The *principilus*, or senior centurion of the *triarii*, was the most important regimental officer, and commanded the legion in the absence of the tribunes. The 300 cavalry formed a regiment of ten *turme*, or troops of 30 horsemen, each under three *decurions*, of whom the senior had the command. The staff of the legion consisted of six tribunes, who managed the paying, quartering, provisioning, &c. of the troops, and who commanded the legion in turns for a period each of two months. This changing command, although inconvenient, lasted till the times of the civil wars, when a *legatus*, or lieutenant-general, was appointed as permanent commandant of the legion. In the time of Marius the manipular formation was abolished, the three lines were assimilated, and the legion was divided into 10 cohorts, each of 3 maniples. Soon the cohorts were raised to 600 men, making the legion 6000 infantry, besides cavalry and velites. It was ranged in 2 lines of 5 cohorts each; but Cæsar altered the formation to 3 lines, of respectively 4, 3, and 3 cohorts. During the later empire the legion became complex and unmanageable; many sorts of arms being thrown together, and balistic, catapults, and onagers added by way of artillery.

Legion of Honour, an order of merit instituted by Napoleon in 1802 as a recompense for military and civil services. It was ostensibly founded for the protection of republican principles and the laws of equality, every social grade being equally eligible. The constitution and incidents of the order have been repeatedly changed by the successive executive powers of France during the course of the 19th century. At its first institution the order embraced four classes; to these a fifth

was added in 1852. At the same time the original star was changed into a cross. At the present time there are five classes—grand crosses, of whom there are 70; grand officers, fixed at 200 members; 1000 commanders; 4000 officers; and 25,000 chevaliers or knights. Foreigners are eligible as members, but they are not counted in their respective classes. In each class three-fifths of the members must be soldiers or sailors. On the obverse of the five-rayed white enamelled cross is a female head representing the republic, surrounded by the words *Republique Française, 1870*; on the reverse are two crossed flags and the motto *Honneur et Patrie*. The cross is suspended by a wreath half of oak, half of laurel, leaves. The ribbon is watered scarlet silk. The military members receive each a pension; those of the first class get 3000 francs a year, those of the second 2000, of the third 1000, of the fourth 500, and of the fifth 250 francs. Candidates in time of peace must have served in some military or civil capacity for twenty-five years; exploits in the field or severe wounds constitute a claim in time of war. Two distributions take place in the year. The nomination of military persons takes place on parade, and of civil in the supreme courts of justice. No ignoble punishment can be inflicted on a member of the order so long as he belongs to it. To rise to a superior rank it is indispensable, at least for natives of France, to have passed through the inferior grades. In addition to the order 40,000 medals are distributed amongst the rank and file of the army. Each medal entitles its bearer to a pension of 100 francs annually. The total annual expenditure of the order amounts to seven million francs. The vast numbers holding this order, and the insignificance of many of the persons on whom it has been conferred, have detracted much from its value. At the date of the battle of Waterloo there were 48,000 members, of whom only 1400 were civilians. In the reign of Napoleon III. the order embraced 64,800, and in 1872, 69,179 persons; but a law was passed in that year that only one new member should be added for every two vacancies in the civilian ranks and one for every three or four in the military. This reduced the membership to 53,848 by 1890. The order gives free education to 400 of the daughters, sisters, and nieces of its members.

Leg-irons. See HANDCUFFS.

Legitim, or **BAIRN'S PART**, in the Scotch law, is the legal provision which a child is entitled to out of the movable or personal estate of the deceased father. The extent of the provision varies according as the wife of the father of the child survives or not. If a wife survive, and also children survive, the movable estate is divided into three equal parts. One is the widow's *Ans Relictæ* (see HUSBAND AND WIFE), another is the children's legitim, the other third is the Dead's Part (*q.v.*), which the father may bequeath by will if he pleases; but if he make no will, then it goes to the children as next of kin. If the wife is dead, then half is legitim, and the other half is dead's part. Moreover, a father, though in his lifetime he may, without any check from his children, squander his property, still is not allowed on his death bed to make gifts so as to lessen the fund which will supply legitim. The children's claim to legitim may be qualified by an antenuptial contract of marriage, which provides some other provision to the children in lieu of legitim; but, as a general rule, the children's claim cannot be defeated by anything the father can do by means of a will or what is equivalent to a will. The legitim is claimable by all the children who survive the father, but not by the

issue of those children who have predeceased. It is immaterial what the age of the child may be, and whether married or not. Children claiming legitimation must, however, give credit for any provision or advance made by the father out of his movable estate in his lifetime. All the children, though of different marriages, share in the legitimation. In England and Ireland there is no similar right to legitimation, for the father can bequeath all his property to strangers if he please; but a similar custom, now abolished, once existed in the city of London and York. By the Married Women's Property Act, 1881, the children of any woman who dies domiciled in Scotland has the same right of legitimation in regard to her movable estate as they have in the movable estate of their father.

Legitimation, in Law, is the act by which children born Bastards (q.v.) are made lawful children. By the common law of England bastardy is admissible. The maxim is 'Once a bastard, always a bastard.' By the civil and canon law, on the other hand, the subsequent marriage of parents who have children begotten and born out of lawful wedlock legitimates the children. This principle of legitimation by subsequent marriage prevails, with modifications, in the law of France, of Germany, of Holland, and of Scotland. It also prevails in most of the states of the American Union; in some it has been adopted by statute. In the reign of Henry III. the bishops of England sought to introduce the rule of the canon law into the law of England, and petitioned the lords to consent that persons born before wedlock should be legitimate so far as regarded inheritance. The earls and barons returned the famous answer of the Statute of Merton, 1235: 'We will not change the laws of England, which up to now have been used and approved.' The Legitimacy Declaration Act of 1858 provided that any native-born British subject, domiciled in England or Ireland, or claiming any estate in England or Ireland, may apply to the High Court of Justice for a decree declaring that the petitioner is the legitimate child of his parents. In the United States cases have occurred in which bastards were legitimated by special acts of the legislature.—There is another kind of legitimation, known as legitimation by royal letters. This does not confer upon bastards the full rights of lawful children, but only gives up such rights to the property of bastards as the law confers upon the crown.

Legitimists, the followers of the elder Bourbon line, as opposed to the Orleansists. See BOURBON, FRANCE.

Legnago, one of the four fortified towns of Northern Italy known as the Quadrilateral (q.v.), is situated on the Adige, 33 miles by rail S.E. from Verona. It has a considerable trade in rice, corn, and silk. Pop. 3514. The fortifications were razed by Napoleon in 1801, but rebuilt fourteen years later.

Legros, ALPHONSE, painter and etcher, was born at Dijon in 1837 of poor parents, who apprenticed him to a house-painter. He first attracted attention by pictures exhibited in the Paris Salon between 1859 and 1863. But three years later he settled in London, and becoming a naturalised Englishman was in 1876 appointed Slade Professor of Fine Arts in University College, London. The subjects he paints best are the rural scenes, and the peasants and humble priests, of France. His admirable artistic method and the austere simplicity and reserve of his style, though they secure him warm admirers amongst artists, have not made him popular. See *Dublin University Magazine* (1880) and *Art Journal* (1881).

Legume (*Legumen*), in Botany, a fruit consisting of a single carpel, two-valved, and with the seeds—one or many—attached to the ventral suture only. It is commonly called a *pod*, and occurs in most of the species of the great natural order Leguminosae (q.v.), of which the bean and pea are familiar examples.

Legumin. See CASLIN.

Leguminosae (*Fabacea* of Lindley), a great natural order of exogenous plants, containing herbaceous plants, shrubs, and trees, many of the latter of the greatest magnitude. The leaves are alternate, usually compound, and have two stipules at the base of the leaf-stalk, which often soon fall off. The inflorescence is various. The calyx is inferior, five-parted, toothed or cleft, the segments often unequal. The petals are five, or, by abortion, fewer, inserted into the base of the calyx, usually unequal, often Papilionaceous (q.v.). The stamens are few or many, distinct or variously united. The ovary is one-celled, generally of a single carpel; the style simple, the stigma simple. The fruit is a legume, which is simply a pod composed of two valves, as in the pea and the bean. The seeds are generally numerous, rarely solitary, occasionally with an aril, often curved; the cotyledons very large.—There are three sub-orders: (1) Papilionaceae, with papilionaceous flowers; (2) Casalpinea, with irregular flowers and spreading petals; (3) Mimosae, with small regular flowers.—This natural order contains almost 7000 known species, of which about 5000 belong to the sub-order Papilionaceae; it is therefore, after the great order Compositae, the most extensive of all the natural orders of flowering plants. They are spread over all parts of the world, from the equator to the poles, but their number is greatest in tropical and subtropical regions. They are applied to a great variety of purposes, and some of them are of great importance in domestic economy, the arts, medicine, &c. To this order belong the Bean, Pea, Kidney-bean, and all kinds of *pulse*: Clover, Liquorice, Broom, Laburnum, Lupine, Sema, and many other medicinal plants, Tamarind, Logwood, Indigo, and many others which afford dyes, &c.; the Acacias, Mimosas, &c. Many species are interesting on account of their beauty of form, foliage, or flowers. In the seeds of many is found a nitrogenous substance called *Legumine* (q.v.) or *Vegetable Casein*.

Le'high, a river which flows 120 miles through eastern Pennsylvania to the Delaware River. Some of its scenery is very picturesque, but the valley is more famous for its rich mines of anthracite coal.

Leibnitz (more accurately but less commonly LEIBNIZ), GOTTFRIED WILHELM, distinguished for almost universal scholarship, especially in philosophy and mathematics, was born on 1st July 1646 at Leipzig, where his father (died 1652) was professor of Moral Philosophy. He attended the Nicolai school in Leipzig, but learned much more from independent study—he taught himself to read Livy whilst still a boy of eight—and at fifteen entered the university of Leipzig to study law. He spent some time also at Jena working at mathematics. Being refused his doctor's degree at Leipzig on account of his youth in 1666, he graduated at Altdorf, the university town of Nuremberg. In the following year he gained a warm and admiring patron in Baron von Boineburg, formerly chief minister to the archbishop-elect of Mainz. At Boineburg's suggestion he presented to the elector his *Nova Methodus Docendi Discendique Juris*, containing a proposed reform of the *Corpus Juris* and of the teaching of jurisprudence; and the elector took the young scholar into his service. Amongst

other duties in which Leibnitz employed his pen was to advocate, in 1669, the claims of the count palatine of Neuburg to the crown of Poland. Three years later he was summoned to Paris to explain at greater length the views he had laid down in an essay entitled *Consilium Ægyptiacum*, which elaborated a plan for the conquest of Egypt; though the real object of the work was to divert the attention of Louis from projects in and upon the German states. This plan of Leibnitz is believed to have suggested the invasion of Egypt which Napoleon attempted in 1798. The tour was extended to London, where Leibnitz became acquainted with Oldenburg, Boyle, and Newton; in Paris he had already learned to know Arnauld, Malebranche, and Huygens. His intercourse with Huygens and Newton stimulated his interest in mechanical and mathematical questions; he invented a calculating machine and devised what was in many respects a novel method of the Calculus (q. v.; and see NEWTON, FLUXIONS). This gave rise to a controversy with Newton as to which of them first invented this valuable mathematical method. In 1676 Leibnitz quitted the service of Mainz, and entered that of Hanover. The duke appointed him custodian of the library at Hanover; and this city was henceforth Leibnitz's headquarters. But his energies found scope outside the library; he effected improvements in the drainage of the mines in the Harz and in the coinage, arranged the library at Wolfenbützel (where Lessing afterwards laboured), and in 1687 visited various cities in Germany, Austria, and Italy to gather materials for an exhaustive history of the Brunswick ducal house. The pope offered him the headship of the Vatican Library; but Leibnitz declined the offer, since the acceptance of it would have compelled him to become a Roman Catholic. The task of working up his materials into connected history employed a good deal of his time in subsequent years. Philosophy, too, absorbed a large proportion of his most serious thought. And in the discussions that were carried on with a view to the reconciliation of the Protestant and Roman Catholic churches Leibnitz took a prominent part, his principal correspondent being Bossuet. In 1686 there was published from his pen the *Systema Theologicum*, composed as a response—conciliatory—from the Protestant side to Bossuet's *Exposition de la Foi*. Subsequently, on the failure of these negotiations, Leibnitz endeavoured, but with the same want of success, to reconcile the Lutheran and the Reformed churches of Prussia. He was more successful in enlisting the interests of reigning princes in scientific societies. He induced Frederick I. of Prussia to found (in 1700) the Society of Sciences at Berlin, and was himself made first president; and he suggested the establishment of similar societies in St Petersburg, Dresden, and Vienna, which were afterwards instituted in each of those capitals. Whilst on a visit to Vienna in 1712-14 he was created a privy-councillor of the empire; he was also made a baron (Freiherr) of the empire. When George of Hanover ascended the throne of England Leibnitz, who some years before had vigorously supported his father's claims to the elector's hat, was disappointed at not being invited to accompany him. But shortly afterwards he died, on 14th November 1716, at Hanover.

The philosophy of Leibnitz holds an intermediate place between the dualism of Descartes and the monism of Spinoza (whom he visited at Amsterdam in 1676). His system is individualistic and dogmatic. He taught that the primary and essential quality of all substance is active force. Substance exists only in the form of atoms or monads, which are simple and similar in constitution, but differ qualitatively; each is a self-

contained individuality. All monads possess two intrinsic properties—perception, or the capacity to mirror the universe, and appetite or striving. The degree of perfection with which each monad reflects the universe depends upon its individual character—i.e. upon the peculiar consensus or balance of relations that exist between the active and the passive elements in its nature. And the entire series of monads, from the very highest (God) to the very lowest, were so constituted, and so arranged from the first, that, whilst each obeys the laws of its own self-determined development independently of all others, it is at every moment in complete accord and harmony with all the rest. The body of man is a complex of separate monads; his soul is a single monad, the substantial centre of his being. Yet no monad can act upon another monad; the active force of each cannot pass out of itself. But the doctrine of general 'pre-established harmony' explains how and what relations do subsist between them, and so between body and soul. He compares body and soul to two clocks which have been constructed in the beginning in such a way, and so perfectly, that both can be depended upon to keep exact time with each other without any bond of connection or any interference from without. God is the primary, supreme, perfect monad; from Him all others proceed as 'influxions' or radiations. Plants and stones are likewise monads; but in their case the perceptive capacity is more or less blurred or slumbering—an adumbration of the modern doctrine of unconscious perception. Since God is the contriver of the universal harmony that prevails amongst all created things, this world must be the best of all possible worlds (see OPTIMISM). The real cogency of Leibnitz's argument depends upon his great logical instrument, the principle of sufficient reason: there *is* a sufficient reason why this world should be the best of all possible worlds, and there is *no* sufficient reason why it should be otherwise. His theory allowed him to demonstrate that there is a substantial agreement between faith and the deliverances of reason. The Leibnitzian ethics are deduced from the property of striving inherent in every monad—the final aim being perfection, reached through individual freedom.

Leibnitz was also a pioneer in the science of comparative philology. He took steps to collect specimens of various distant languages, in Asia and elsewhere, and studied them in a scientific manner. He recognised two great divisions of speech, the Aryan, which included Arabic and Hebrew, and the Japhetic or Celto-Scythian, which coincided pretty nearly with what was subsequently called the Indo-Germanic or Aryan family of speech. Cf. Max Müller, *Science of Language*.

Leibnitz left no complete systematic account of his philosophical views. They have to be gathered from several collections of letters, essays contributed to the journals *Acta Eruditorum*, *Journal des Sçavants*, &c., and a few treatises, such as *De Principio Individui* (1663); *Essai de Théodicée sur la Bonté de Dieu, la Liberté de l'Homme, et l'Origine du Mal* (1710); *Principes de la Nature et de la Grèce* (1718); *Monadologie* (1714), and *Nouveaux Essais sur l'Entendement* (1765). In this last work he closely criticises Locke's celebrated *Essay on the Human Understanding*; and supplements the English philosopher's maxim of *Nihil est in intellectu quod non fuerit in sensu*, by adding *nisi ipse intellectus*. Editions of Leibnitz's writings have been published, though none is complete, by Dutens (6 vols. Geneva, 1768), by Fetz and Gerhardt (19 vols. 1843-50), and by O. Klopp (11 vols. 1862-84). The best *Life* is Gultzner's (2 vols. 182-46). See also biographical works by Kirchner (1877) and E. Pfeleiderer (1870), and Bodenmann on his Correspondence (1889). Feuerbach (1837), Zimmermann (1847, &c.), and K. Fischer (1867) have written on his philosophy.

Leicester, the county town of Leicestershire, a municipal, parliamentary, and county borough, is situated on the Soar, a tributary of the Trent, 22 miles S. of Nottingham, 38 ENE. of Birmingham, 20 NNE. of Rugby, and 97 NNW. of London. Traditionally founded by the British king Lear, it occupies the site of the Roman *Raba*; and pavements, urns, and other Roman relics have been found, while the 'Jewry Wall,' 20 feet high and 75 long, which got its name from the mediæval ghetto, is composed of rubble and Roman bricks. Its present name comes from the Anglo-Saxon *Leocæstre*, or 'fortress of the Leire,' as the river was called of old. The Norman castle, dismantled by Charles I. in 1645, is represented chiefly by the modernised assize hall, and by an artificial earthwork, the Mound or Castle View, on which stood the donjon-keep; the Abbey of Black Canons (1143), where Wolsey died in 1530, is an insignificant if picturesque ruin. In the Blue Boar Inn, demolished about 1829, Richard III. slept the night before Bosworth (1485); and his corpse was brought back hither for burial. A handsome memorial cross or clock tower (1868) bears the effigies of Simon de Montfort, Earl of Leicester, Sir Thomas White, Alderman Newton, and William of Wyggeston. There is a statue also of Robert Hall; and among the other edifices are the old town-hall, with good carving and stained glass of Henry VII.'s time; the new municipal buildings (1876), Queen Anne in style, with a clock-tower 134 feet high; the post-office (1887), public baths (1879), free library (1879), school of art (1876), opera-house (1877), poor-law offices (1883), corn exchange (1852), lunatic asylum (1836), the museum (1848), rich in local antiquities; the Wyggeston Hospital Schools (1513; rebuilt 1877-78); and five interesting old churches—St Nicholas', St Mary's, All Saints', St Margaret's, and St Martin's, the last with a spire 218 feet high. The New Walk is a pleasant tree-shaded promenade; the racecourse of 1806 is now a recreation ground, known as the Victoria Park, its successor being at Oadby, 3½ miles distant; the Abbey public park was opened by the Prince of Wales in 1882; and there is a third public park called the Spinney Hill Park. The abnormally rapid growth of Leicester has been due to its central position, to its transit facilities by three railway companies and by water, and to the great extension of its industries. The manufacture of plain and fancy hosiery, introduced in 1680, is equalled only by Nottingham; in that of pegged and riveted boots and shoes Leicester vies with Northampton. Iron-founding is also carried on, with manufactures of elastic webbing, sewing-cotton, lace, lamb's-wool, &c. There is coal in the neighbourhood, and a large sewage-farm. First chartered by King John, Leicester has returned two members to parliament from Edward I.'s time. It has figured prominently in the anti-vaccination contest. Pop. (1801) 17,005; (1861) 68,056; (1871) 95,084; (1881) 122,351; (1891) 174,624.

See local histories by Throsby (1777-91), T. Robinson (1793), James Thompson (1839-71), Hollings (1855), Robert Road (1881), and Mrs T. Fiddling-Johnstone (1892).

Leicester, ROBERT DUDLEY, EARL OF, born about 1532, was the fifth son of John Dudley, Duke of Northumberland, and grandson of the notorious Edmund Dudley, who was beheaded for treason by Henry VIII. His father was executed for the part which he took in the cause of Lady Jane Grey (q.v.), and he was himself sentenced to death. He was liberated in 1554; and in 1558, on the accession of Elizabeth, a great career opened before him. He was made Master of the Horse, Knight of the Garter, a Privy-councillor, High Steward of the university of Cambridge, Baron

Dudley, and finally in 1564 Earl of Leicester. For these high honours he seems to have been indebted mainly to a handsome person and a courtly manner. In 1550 he had married Amy, daughter of Sir John Robsart. She lived in the country, and early in 1560 removed to Cumnor Place, Berkshire, the house of Anthony Forster, a creature of her husband's, where, on 8th September, she was found lying dead, with her neck broken, at the foot of a staircase. It was generally believed at the time that she was murdered, and that Dudley, if not Elizabeth herself, was an accessory to the crime. This belief receives some support from certain discoveries made in the archives at Simancas, which indicate that a plot to poison her was actually entered into before her death. Elizabeth continued to favour Leicester in spite of his unpopularity in the country and of his secret marriage in 1573 to the Dowager Lady Sheffield. In 1563 she had suggested him as a husband for Mary, Queen of Scots, and in 1575 she consented to be magnificently entertained by him at his castle of Kenilworth (q.v.). In 1578 he bigamously married the widow of Walter, Earl of Essex, and when the fact was revealed to Elizabeth, she was greatly, but only temporarily, offended. In 1583 he commanded an expedition to the Low Countries, of which next year he was appointed governor—an expedition that is notable chiefly for the unsuccessful siege of Zutphen, in the course of which Sir Philip Sidney, his nephew, met with his death. In 1587 he again showed his military incapacity in the same field, and had to be recalled. Yet in 1588 he was appointed to command the forces assembled at Tilbury, to defend England against the Spanish Armada. He died suddenly on 4th September of the same year at Cornbury, in Oxfordshire, of poison, said rumour, intended for his wife. See ELIZABETH, with works there cited; and the article 'Robert Dudley' by Mr S. L. Lee in vol. xvi. of the *Dictionary of National Biography* (1888).

Leicester of Holkham, THOMAS WILLIAM COKE, EARL OF, was born on 4th May 1752, a descendant of the famous lawyer Coke. He was one of the first agriculturists of England; by his efforts for the improvement of farming north-west Norfolk was converted from a rice-growing into a wheat-growing district, its system of cultivation was entirely revolutionised for the better, and more stock and of better breeds was kept on the farms. When in 1776 he succeeded to his estates they yielded an annual rental of £2200; at his death they brought in £20,000 and more. The sheep-shearing festivals at Holkham were celebrated the country over. Coke represented Norfolk in the House of Commons during the greater part of the period from 1776 to 1833. He was a staunch Whig, and a strong supporter of Fox. In 1837 he was created Earl of Leicester of Holkham, to distinguish the title from the Earldom of Leicester, already held by the Townshend family. Coke refused every other title except that of Earl of Leicester, because that title had been borne by his great-uncle, but on his death in 1759 had become extinct. He died at Longford Hall, Derbyshire, 30th June 1842.

Leicestershire, a midland county of England, surrounded by Nottingham, Lincoln, Rutland, Northampton, Warwick, and Derby shires. It has a maximum length and breadth of 44 miles by 40, and contains 863 sq. m., or 514,164 acres. Pop. (1801) 131,081; (1841) 215,867; (1881) 321,258; (1891) 373,984. Its surface is mainly undulating tableland, the highest ground being at Charnwood Forest in the north-west, where Bardou Hill rises to a height of 853 feet above sea-level. The Soar, itself an affluent of the Trent, which for a

short distance borders the county on the north, is, with its tributary the Wreak, the principal river. The soil, varying in fertility, is generally loamy; in the north-west are valuable coal-mines, also granite, slate, and limestone quarries, but the greater part of the county being under pasture, the quantity of corn grown is comparatively small. According to the agricultural returns for 1889 the area under corn crops was only 73,582 acres, and under green crops 20,935 acres, whilst 341,905 acres were laid down as permanent pasture or grass. Hence the principal objects of agriculture practised in the county are grazing and sheep and cattle breeding, Leicestershire being especially noted for its breed of the former. Of manufactures the principal are those of hosiery and boots and shoes; basket-making is carried on at Castle Donnington; and Stilton cheeses are for the most part made in this county. Leicestershire comprises six hundreds, the parliamentary and municipal borough of Leicester, and 332 parishes, almost entirely in the diocese of Peterborough, and, for judicial purposes, in the Midland Circuit. Leicester is the assize town, and other towns are Ashby-de-la-Zouch, Hinckley, Loughborough, Lutterworth, Market Harborough, and Melton Mowbray, the last two being great hunting centres. Six members are returned to parliament, and the county council consists of fifty-one members. In historical annals the principal event associated with the county is the battle of Bosworth Field (1485), in which Richard III. lost his life. Amongst persons of note identified with Leicestershire may be mentioned Wyclif, Cardinal Wolsey, Lady Jane Grey, Mary Queen of Scots, Beaumont the dramatist, George Villiers, Duke of Buckingham, Cleveland the poet, George Fox, Simpson the mathematician, Dr Johnson, Lord Macaulay, Hobart Pasha, Colonel Burnaby, and last, but not least, Daniel Lambert. See the histories of the county by Burton (1622; 2d ed. 1777), Nichols (4 vols. 1795-1815), and Curtis (1831).

Leichhardt, FRIEDRICH WILHELM LUDWIG, explorer in Australia, was born at Treborsch, south-east of Berlin, on 23d October 1813, and studied philology at Göttingen and natural science at Berlin. In 1841 he proceeded to Australia. There he conducted an expedition (1843-48) from Moreton Bay, in Queensland, north-westwards to the Gulf of Carpentaria, and then, skirting its south and west shores, finally reached Port Essington. In the end of 1846 he made an unsuccessful attempt to cross the base of Cape York Peninsula. In November 1847 he again started from Moreton Bay with the intention of crossing the entire continent from east to west, but he was lost in the interior. Nothing authentic has been heard of him since April 3, 1848. The *Journal* of his first journey was published in London in 1847, and his *Letters* in German in 1881.

Leigh, a town of Lancashire, 21 miles NE. of Liverpool and 16 W. of Manchester. Silks and cotton goods are extensively manufactured; iron-foundries, breweries, malt kilns, and glass-works count amongst the principal industrial establishments. In the vicinity are productive coal-mines. Pop. (1861) 10,621; (1881) 21,734; (1891) 28,702. See Worsley's *History of Leigh* (1870).

Leighton, FREDERICK, LORD, P.R.A., was born at Scarborough 3d December 1830. His father was a doctor, but he early recognised his son's bias towards painting, and gave him what he deemed the best training for his profession. Frederick's early years were spent in a series of grand tours. He visited Rome, Florence, Frankfurt, Berlin, Paris, and Brussels, and everywhere he received instruction from the most distinguished

masters. At fourteen he was already a promising student at the Accademia di Belle Arti at Florence. At Frankfurt he came under the influence of Steinfel, a rigid Teuton, the friend and disciple of Overbeck; and there remained a certain coldness in his colour which proved that he never quite lived down the results of Steinfel's tuition. He made his first appearance at the Royal Academy in 1855 with his famous picture 'Cinabine's Madonna' carried in Procession through the Streets of Florence.' This work was an immediate success and was purchased by the Queen. Of his later works may be mentioned 'The Triumph of Music' (1856), 'Paolo and Francesca' (1861), 'The Odalisque' (1862), 'Atiadne' (1868), 'Hercules wrestling with Death' (1871), 'The Harvest Moon' (1872), 'The Daphnephoria' (1876), 'Wedded' (1882), 'Cymon and Iphigenia' (1884), 'Andromache' (1888), 'The Bath of Psyche' (1890). He also won considerable distinction as a sculptor, and in 1877 his 'Athlete struggling with a Python' was purchased out of the funds of the Chantrey Bequest. In 1864 he was elected Associate of the Royal Academy. Five years later he took his place among the forty. On the death of Sir Francis Grant in 1878 he was elected President and was knighted. He was created a baronet in 1886. He received a grand medal of honour for sculpture at the Paris Exhibition of 1889, and the universities of Cambridge, Oxford, and Edinburgh conferred upon him their honorary degrees. He was created Lord Leighton of Stretton on 1st January 1896, died, unmarried, on the 25th of the same month, and was buried in St Paul's. Lord Leighton was a scholar and a man of the world as well as a painter, and discharged the duties of his onerous position with marvellous tact and success. Under his presidency the Academy enjoyed a material prosperity and social influence which it attained under no one of his predecessors. As an artist he was always inspired by the loftiest ideals, and assiduously cultivated the 'grand style.' Neither realism nor archaeology ever availed to turn him aside from the straight path; but it may be objected that his temperament was rather that of the scholar than of the artist. Of his Daphnephoria (sold in 1893 for £3700) Holman Hunt said, 'It is the very noblest painting produced in modern, if it does not excel all of ancient, times.' See Mrs Andrew Lang in the *Art Annual*, 1885, and a monograph by Ernest Rhys (1909).

Leighton, ROBERT, perhaps the rarest flower that has grown out of Scotch theology, was born in 1611, but where is as yet quite uncertain. He was the second son of Dr Alexander Leighton (1568-c. 1649), Presbyterian minister in London and Utrecht, the author of *An Appeal to the Parliament: or Simon's Plea against the Prelate* (1628), which earned him from the tender mercies of Laud the cruel punishment of scourging, the pillory, branding and mutilation, heavy fine, and close imprisonment. At sixteen the boy went to the university of Edinburgh, where he graduated M.A. in 1631. The only record of his college days is a sarcastic and obvious epigram on Aikenhead, the provost of Edinburgh. He next spent some years in France, and widened his spiritual sympathies by living some time with Roman Catholic relatives at Douay. He was ordained Presbyterian minister of Newbattle in 1640, signed the Covenant along with his parishioners two years later, and, in spite of Burnet's account of his lack of sympathy with his brethren, appears to have taken his part in all the Presbyterian policy of the time, and even to have represented the Synod of Lothian in a mission to London. The famous story of his being questioned 'whether he preached to the times' and of his retort that surely they might 'permit a poor brother to preach Jesus Christ and eternity' is

unauthenticated. At this period he was a frequent visitor to London, and after 1646 he went thither once a year. About the close of 1652 he applied for leave to resign his charge, on the plea of inability to perform its duties from ill health and weakness of voice, and early next year he was allowed to do so on being appointed Principal of the university of Edinburgh.

Here he remained nine years, and Burnet testifies to his remarkable influence over the students. Elsewhere he tells us of the wonderful effect of his preaching, which yet displeased Presbyterian zealots from its haranguing method, without heads. Leighton's *Prælectiones Theologicae* are extant to show the kind of Latin orations which he delivered weekly. Most of the *Sermons* and the *Commentary on the First Epistle of Peter* were the work of the Newbattle period. The Restoration placed on the throne an absolute king with a rooted determination to force Episcopacy on Scotland. Leighton after much reluctance was forced by the king himself to become one of the bishops of the new ecclesiastical regime, but with characteristic modesty chose for himself Dunblane, the poorest of the new dioceses, although the elevation was to him 'a mortification greater than a cell and hair-cloth.' The worldly-minded Sharp at first had his scruples about receiving new ordination; to the saintly Leighton, indifferent to the mere externals of religion, this was a detail of no great moment. On the northward journey he discovered the true motives of Sharp and his brother bishops, and left them at Morpeth to avoid their hateful triumphal entry into Edinburgh. For the next ten years the beautiful little town of Dunblane was his home, and here he laboured with a sinking heart to build up the shattered walls of the church, although he soon lost all hope of success, while his work 'seemed to him a fighting against God.' It was characteristic of the man that he never would permit himself to be addressed as 'my lord,' and that he only appeared in parliament when church matters were in dispute. His conception of Episcopacy was similar to that suggested by Archbishop Ussher, and his aim was to preserve what was best in the two systems as a basis for comprehensive union, 'reconciling the devout on different sides.' But nowhere among his unworthy associates did he find any 'such appearance of seriousness or piety as became the new-modelling of a church,' and he only succeeded in being misunderstood by both sides, his moderation being misread by the fiercer Presbyterians as 'pretended holiness, humility, and crucifixion to the world,' assumed as 'a cloak under which to creep toward promotion'—'a mere betrayal of religion with a kiss.' The severity of his life, his unworldliness, and even his celibacy, were thought to savour of Romanism, and already his recommendation of his favourite book, *The Imitation*, to the Edinburgh students, had given offence to rigid Presbyterian-like Dickson, who refused it because 'self and merits run through it.' Row characterises him as 'carrying like a pawky prelate,' and says that his condescensions made the Dunblane clergy think 'he was but *stoking* cream in their mouths at first.' The continued persecutions of the government, bent on playing out 'a forlorn after-game,' drove him to London in 1665 to resign his see. He told the king he 'could not concur in the planting the Christian religion itself in such a manner, much less a form of government.' Charles apparently listened with respect, and the good bishop was persuaded to return. Again in 1669 he went to London to advocate his scheme of Accommodation, and after his return voted in favour of the unjustifiable Assentory Act—a weak piece of compliance

which he repented all his life. Immediately after he assumed the duties of commendator of the archdiocese of Glasgow, while still continuing for some time Bishop of Dunblane. Next followed his fruitless conferences at Edinburgh in 1670 and 1671 with leading Presbyterians on behalf of Accommodation, and his sending through the western counties itinerant advocates of the cause. In despair of success he begged for permission to retire, and at length about the close of 1674 was permitted to lay down his archbishopric. His letter to Lauderdale (December 17, 1674) describes his sickness and sense of his own unworthiness, and his desire to spend the remainder of his life in quiet retirement, as well as 'pity to see a poor church doing its utmost to destroy both itself and religion in furious zeal and endless debates about the empty name and shadow of a difference in government, and in the meanwhile not having of solemn and orderly public worship so much as a shadow.' His last ten years he spent in calm preparation for his end, in the house of his widowed sister, Mrs Lightmaker, at Broadhurst Manor in Sussex, frequently preaching in the church of Horsted Keynes, in the south transept of which he lies. His death, which was the result of an attack of pleurisy, came suddenly, 25th June 1684, in an inn—as he often said he wished it should—in Warwick Lane, London, whither he had been summoned by Burnet to an interview with Lord Perth, just appointed Lord Chancellor of Scotland.

No man ever lived more intensely absorbed in the love of God than Leighton; no saint was ever filled with a greater measure of the spirit of Christ. It was characteristic of him that he never thought his writings of any value, that he printed nothing himself, and that he left orders for his MSS. to be destroyed; yet no religious books reveal a deeper spirituality, a more heavenly exaltation and devotion. And no less wonderful is their sweetness and beauty, wedded to sincerity and intellectual strength, as well as their broad catholicity of spirit—the direct outcome of a large mind moulded in Christian charity. He saw the good that underlay all ecclesiastical systems, and yet recognised how profitless all might become if allowed to interpose between the human soul and God. Love of peace was with him a passion, though unhappily he fell on evil days and unhappy methods of conciliation. The best tribute to his memory is from the pen of Burnet, who says at the conclusion of his *Pastoral Care*, 'in a free and frequent conversation with him for above two and twenty years, I never knew him say an idle word that had not a direct tendency to edification; and I never once saw him in any other temper but that which I wished to be in in the last moments of my life.' And again in the *History of His Own Time* he says: 'I bear still the greatest veneration for the memory of that man that I do for any person; and reckon my early knowledge of him, which happened the year after this [Leighton's promotion to a bishopric], and my long and intimate conversation with him, that continued to his death, for twenty-three years, among the greatest blessings of my life; and for which I know I must give account to God, in the great day, in a most particular manner.' Of great modern Englishmen none has esteemed Leighton more highly than Coleridge, whose *Aids to Reflection* indeed is based on aphorisms culled from his writings.

Leighton left his library to Dunblane, which has another memorial of its great bishop in the 'Bishop's Walk' along the banks of the Allan Water. In the *Bibliotheca Leightoniana* there were originally more than 1500 volumes, and upwards of 1200 still remain, more than 200 of which have interesting marginalia. His first editor was his friend Dr Fall, who printed most of the works from 1692

to 1708. The chief later editions are those of Doddridge (1748), Jerment (1805-8), Pearson (1825), and Aikman (1831). The last three editions have lives of the author, of which Pearson's is full and good. The best and most complete edition is that of the Rev. William West, although the method of editing is not entirely to be commended, and the anti-Presbyterian prejudice ill befits the subject. The work was the labour of a quarter of a century, and vols. ii.-vi. were issued 1869-70; vol. vii., 'Remains,' in 1875. Vol. i., to include the Life and Letters, is not yet published. There is an admirable volume of *Selections from the Writings*, with a brief Memoir (1883), by the Rev. Dr Blair of Dunblane. See also the last scholar's 'Bibliography of Archbishop Leighton' in the *British and Foreign Evangelical Review* for July 1883.

Leighton-Buzzard, a market town of Bedfordshire, on the Ouse, 41 miles by rail N.W. of London. Its fine cruciform church, mainly Early English, has a spire of 193 feet, and was restored in 1886; in the market-place is a pentagonal cross; the corn exchange was built in 1862. Straw-plait is the staple industry. The suffix *Buzzard* is a corruption of Beaudesert or Bosard, a great family here in the 14th century. Pop. (1851) 4465; (1881) 5991.

Leiningen, a mediatised princely House of Germany, dating back to 1096. In 1779 the head of one of the branches into which it had become divided, the Count of Leiningen-Dachsburg-Hardenburg, was raised to the rank of a prince of the empire; but the peace of Lunéville deprived him of his ancient possessions, about 252 square miles in extent, on the left bank of the Rhine. Though no longer an independent prince, the head of the House retains his rank and wealth, and owns extensive possessions in Bavaria and Hesse. The mother of Queen Victoria had for her first husband the Prince of Leiningen.

Leinster, one of the four provinces of Ireland, occupies the south-east portion of the country. See IRELAND.

Leipa, a town of Bohemia, 40 miles N. by E. of Prague. It has some manufactures of woollens, cotton, glass, and steel. Pop. 9090.

Leipzig (Fr. *Leipsic*), the third commercial city of Germany, is situated in a large and fertile plain in the kingdom of Saxony, 80 miles by rail W.N.W. of Dresden, and 101 S.S.W. of Berlin, within 6½ miles of the Prussian border, and 3 miles above the junction of the three small streams, Elster, Pleisse, and Parthe. The inner or ancient town, the centre of the business activity, with narrow and crooked streets and quaint houses, is separated by a broad, tree-shaded promenade (laid out since 1781 on the site of the old walls) from the much more extensive modern suburbs, bounded in their turn by a girdle of busy manufacturing 'villages.' Of these last, Renditz, Entritzsch, Gohlis, and others were incorporated with the city in 1889 and 1890. The pop. within the official city limits was in 1800, 32,146; in 1860, 85,394; in 1880, 149,981; and in 1885, 170,312, including a garrison of 3373; in 1895, including all the villages incorporated in the preceding years, the population was 399,963. Many handsome edifices have been erected, numerous fine streets laid out and built, and great civic improvements effected at Leipzig in the last quarter of the 19th century; but few of the public buildings are specially remarkable. The two principal city churches, the Thomaskirche and the Nicolai kirche, date respectively from 1496 and 1525; the quaint old Rathhaus, or town-hall, from 1556. The old Pleissenburg (built in 1213, rebuilt 1551) was repeatedly besieged (in the Thirty Years' War) and taken; all but the tower was demolished since 1895. Amongst the modern buildings are the Municipal Theatre (1868), one of the largest and handsomest in Germany; the Museum (1856-58; enlarged in

1883-86); the new Exchange (1884-86); the Observatory (1861); the Booksellers' Exchange (1888), with an interesting museum; St Peter's Church (1885), a fine specimen of modern German Gothic; and the magnificent Imperial Law-courts, opened in 1895. The noble New Gewandhaus has since 1884 superseded the old Gewandhaus (so called because originally a drapers' hall), in which, since 1781, some of the best concerts in Europe were given. Leipzig contains numerous squares and open spaces, affording ample room for the stalls and booths of the retail dealers at the fairs. The largest is the Augustus-Platz; the quaintest the Market-place, in which a large war monument for 1870-71 was unveiled in 1888. The Rosenthal and the Johanna-Park are fine parks on the outskirts; while farther out are fine oak and beech woods.

Leipzig resembles Edinburgh in being an important legal, educational, and book-publishing centre, though in its other commercial interests it far outdistances the Scottish capital. It has been the seat of the supreme court of the German empire since 1879. The foundation-stone of a new building for this tribunal was laid here in 1888. The university, founded in 1408 by a secession from Prague, has 182 professors and lecturers, and more students (averaging over 3000) than any other German university except Vienna, Berlin, and Munich. The Augusteum, or main building, is in the old town; but it is supplemented by spacious medical and physical laboratories and other 'institutes' (forty-eight in number) in other parts of the town, including a new library-building containing 350,000 vols. and 4000 MSS. The City Library has 100,000 vols. and 1500 MSS. Among the numerous other educational establishments are two gymnasias, a justly famous School of Commerce, a conservatory of music (400 pupils), reckoned amongst the first in Europe, and many literary, artistic, and scientific institutions. The hospital system of Leipzig is one of the best developed in Europe, and has largely benefited the medical faculty of the university. As a seat of trade Leipzig is inferior only to Hamburg and Berlin among the towns of Germany. The chief articles of commerce are furs and skins, cloth, leather, and books. The famous Leipzig fairs are held at Easter, Michaelmas, and the New Year, and last from three to five weeks. Their origin is traced as far back as 1180; their importance dates from about 1500, and they reached their greatest prosperity at the end of the 17th and the end of the 18th centuries. The accession of Saxony in 1833 to the German Customs Union (Zollverein) gave another lullip to the business of these fairs; but since 1865 the growth of railways and telegraphs, and the greater numbers of commercial travellers have gradually reduced their importance, though they are still attended by about 30,000 strangers, including Jews, Turks, Greeks, Armenians, Persians, and even (of late) Chinese. Transactions to the extent of over £10,000,000 sterling are said to take place at the Easter fair. Leipzig ranks next to London and Paris as a seat of the bookselling and publishing trade. Nearly 500 houses are engaged in the book-trade, and there are also about eighty printing establishments; while type-founding has here its chief centre in Germany. The German booksellers have established a common exchange and clearing-house at Leipzig; and at the annual settlements of accounts at the Easter or Jubilate fair six thousand principals are said to be here represented by their commissioners. The wool-market, in June, is still much frequented, though the amount of wool offered for sale in 1888 (about 218,000 lbs.) was less than half that offered in 1878.

Among the chief manufactures (carried on mainly in the 'villages') are pianofortes, paper, chemicals, oils, scientific instruments, spirits, beer, tobacco, and some textiles. Iron-founding is also carried on. The wax-cloth industry is declining.

Leipzig, formerly Libzk or Lipzk (from the Slavic *Lip* or *Lipa*, a 'lime-tree'), originally a Wendish settlement, is first mentioned as a town in 1015. In the latter part of the 12th century it had from 5000 to 6000 inhabitants, and it rapidly grew in importance and prosperity under the fostering care of the margraves of Meissen, who granted it numerous commercial privileges. Leipzig suffered greatly in the Thirty Years' War, in which it was five times besieged and taken, and again in the Seven Years' War; and although the commercial changes connected with the French Revolution at first affected it very favourably, yet it suffered not a little amidst the terrible struggles of the years 1812 and 1813, when it was alternately in possession of the French and of the allies. In 1866 it was occupied for some months by Prussian troops. In recent years Leipzig has been noted as the headquarters of the Socialistic party in Germany. The famous Leipzig Conference between Luther, Eck, and Carlstadt, which took place in the Pleissenburg in 1519, and the Leipzig Interim (see INTERIM) of 1548 are important in the history of the Reformation. Leipzig was the birthplace of Leibnitz and of Wagner; J. S. Bach was director of music in the two chief churches, and 'cantor' in the Thomasschule from 1724 till 1750; and Mendelssohn was director of the Gewandhaus Concerts from 1835 till 1841. In literary history Leipzig is famous as the seat of the Saxon or Leipzig school of criticism, headed by Gottschel (q.v.). One of the scenes in Goethe's *Faust* is placed in Auerbach's Keller, in Leipzig, still shown, with old frescoes illustrating the legend used by the poet.

The immediate neighbourhood of Leipzig has been the scene of two battles of great importance in the history of Germany and of Europe—the battle of Leipzig, or of Breitenfeld (q.v.), on September 7, 1631; and the great battle of Leipzig—called the *Battle of Nations*—from the 16th to the 18th of October 1813. The latter was one of the most bloody and decisive of those which effected the deliverance of Europe from French domination. The troops under Napoleon in this battle amounted to about 180,000 men, and those of the allies, commanded by Prince Schwarzenberg, Marshal Blücher, and Bernadotte, Crown prince of Sweden, to almost 300,000. The loss of the French was reckoned at about 30,000 killed and wounded, and 38,000 prisoners; that of the allies at about 52,000. The victory of the allies was complete, and the French had to evacuate Leipzig.

See works on Leipzig by Grosse (1837-42), Sparfeld (1851), Kneschke (1870), Wurtke (1873), Hasse (1878), Hirschfeld (1887), Moser, Bönndorf, &c.

Leith, the fifth largest town in Scotland, an important seaport, and a municipal and parliamentary burgh, stands on the southern shore of the Firth of Forth, at the mouth of the Water of Leith, 2 miles N. of Edinburgh (q.v.), with which it is now connected by a continuous line of street. It is even less attractive than most seaport towns; still, great improvements have been effected since 1877, and some of the public buildings are not bad. Among them are the court-house or town hall (1827), custom-house (1812), exchange, corn exchange (1862), Trinity House (1816), hospital (1850), Sailors' Home (1883-84), and St James's Episcopal Church (1862-69), by Sir G. G. Scott, with a spire 180 feet high. Leith Fort (1779) is now the artillery headquarters in Scotland. The harbour-works have cost upwards of a

million sterling. They comprise five docks, constructed between 1801 and 1881, with an area of 43 acres, besides a sixth (1892-1901), with an area of 60 acres; seven graving-docks; and two piers, 1177 and 1041 yards long. The foreign, colonial, and coasting trade of the port is great and increasing. In 1896, 4282 ships with an aggregate tonnage of 1,556,917 tons entered, and 4038 ships of 1,544,050 tons cleared. The imports (corn, chemicals, sugar, woollen and linen yarn, timber, fruits, &c.) have an annual value of more than £8,000,000; the exports (coal, iron, cotton goods, &c.) of about £3,000,000. There is regular steamboat communication with London, the north of Scotland, several continental ports, and New York. Shipbuilding has of recent years become a large and important industry; and extensive employment is also afforded by large flour-mills, sugar-refineries, distilleries, breweries, engineering-works, sawmills, rope-works, chemical works, &c. Leith was constituted a parliamentary burgh in 1833, and with Portobello and Musselburgh returns one member. Its nine months' siege by the Protestants (1559-60), the surprise of its citadel by the Jacobites (1715), and royal visits, innumerable are the chief events in its history. Home, the author of *Douglas*, was a native; John Logan was a minister; and Robert Nicoll is buried here. Pop. (1841) 26,026; (1881) 59,485; (1891) 68,707. See works by A. Campbell (1827), D. H. Robertson (1851), J. Martine (1888), and J. C. Irons (1898); see also EDINBURGH.

Leitha, an Austrian stream rising in Lower Austria, and flowing NE. to join the Danube nearly along the frontier of Lower Austria and Hungary. Since the reorganisation of the empire in 1867, it has become usual to speak of Hungary and the lands belonging to the Hungarian crown as *Trans-leithan*, and the rest of the empire as *Cis-leithan*—thus giving the stream a factitious importance.

Leitmeritz, an old town, partly walled, of Bohemia, at the head of steamboat navigation on the Elbe, here crossed by a bridge 1805 feet wide, 34 miles W. by N. of Prague. Here are a cathedral (1671) and a bishop's palace; and in the town-house (1535) valuable archives are preserved. Brewing is the staple industry. Fruit, wine, and hops are extensively grown. Pop. 10,854.

Leitmotiv. See MOTIF, WAGNER.

Leitomischl, an old town of Bohemia, 85 miles ESE. of Prague, with a fine castle, a Piarist college, and manufactures of linens, woollens, jute, &c. Pop. 5258.

Leitrim, a county in the north-east of the province of Connaught, in Ireland. Its greatest length, north east to south-west, 51 miles; greatest width, 21 miles. Area, 376,242 acres, or 588 sq. m., of which 282,400 are arable, 11 per cent. barren, and 7 per cent. bog. The county touches the ocean on the north, and is divided into two parts by Lough Allen (q.v.), from which the Shannon forms the south-west boundary of the county. The southern division contains numerous small lakes. The northern division is intersected by several ridges. To the north of Lough Allen the soil, except at rare intervals, is unfavourable for agriculture, and the climate damp and ungenial. Leitrim is more a grazing than a tillage district, 53 per cent. of its area being grass-land. Potatoes and oats are the only crops of consequence. Coal is found in the Lough Allen basin; and iron and lead ores are abundant, although mining operations are very sparingly carried on. Linens and coarse woollens are manufactured for domestic use. The county town is Carriek-on-Shannon. Leitrim returns two members. Pop.

(1841) 155,297; (1861) 104,744; (1881) 90,372; (1891) 78,618. Leitrim was reduced by the English in the reign of Elizabeth, but revolted in 1588, submitting once more in 1603. The confiscations which followed the Civil War practically extinguished the native proprietary and the family of O'Rourke to whom it had once belonged.

Lekin (*Li-kin*), the transit-dues of China (q.v.).

Leland, CHARLES GODFREY, an American author, was born in Philadelphia, 15th August 1824, graduated at Princeton in 1846, and afterwards studied at Heidelberg, Munich, and Paris. He was admitted to the Philadelphia bar in 1851, but turned from law to journalism. From 1869 he resided chiefly in England, and investigated the language and customs of the Gypsies, a subject on which between 1873 and 1890 he published four valuable works. Leland is most widely known, however, for his dialect poems in 'Pennsylvania Dutch,' the famous *Hans Breitmann Ballads* (1871). Other works are *The Poetry and Mystery of Dreams* (1855), *Meister Karl's Sketch-book* (1855), *Legends of Birds* (1864), *Fu-Siang* (1875), *Algonquin Legends* (1884), *Etruscan Remains and Popular Tradition* (1892), *Hans Breitmann in Tyrol* (1895), besides a translation of Heine. See his autobiographical *Memoirs* (1893).

Leland, JOHN, born in London about 1506, was educated at St Paul's, then at Christ's, Cambridge, and All Souls', Oxford. He became chaplain to Henry VIII., who in 1533 commissioned him as 'king's antiquary,' with power to search for records of antiquity in the cathedrals, colleges, abbeys, and priories of England. The next six years he devoted to his tour with unresting diligence, and collected 'a whole world of things very memorable,' to the arrangement of which he gave the remainder of his life. His church preferences were the rectories of Pöfeling, in the marches of Calais, and Haseley in Oxfordshire, a canonry of King's College (now Christ Church), Oxford, and a prebend of Salisbury. His last five years were darkened by insanity, from which he found relief in death, April 18, 1552. He had laboured in vain with gigantic industry to arrange and digest his vast collection of materials, into which harrowed his successors, Stow, Camden, William Burton, and Dugdale.

Most of his papers are now in the Bodleian and British Museum. Besides his *Comментарii de Scripioribus Britannicis* (ed. by Anthony Hall, 2 vols. 1709), his chief remaining works are *The Itinerary* (ed. by Thomas Hearne, 9 vols. 1710-12) and *De Rebus Britannicis Collectanea* (ed. by Hearne, 6 vols. 1715). For his life, see the *Life of Leland, Hearne, and Wood*, edited by W. Huddesford (2 vols. 1772).

Leland, JOHN, an eminent 18th-century English apologist for Christianity, was born at Wigan, in Lancashire, in 1691, and educated at Dublin, where he was a Presbyterian minister from 1716 till his death in 1766. His first publication was *A Defence of Christianity* (1733), in answer to Tindal's deistical work, *Christianity as Old as the Creation*. This was followed by *The Divine Authority of the Old and New Testaments*, in answer to Morgan's *Moral Philosopher*. His most important work is *A View of the Principal Deistical Writers that have appeared in England* (1754-56). Leland was, in Leslie Stephen's phrase, the 'most worthy, painstaking, and commonplace of divines,' and many more than the few that read it still regard his work as a satisfactory demolition of deism. To his *Discourses on Various Subjects* (1 vols. 1768-89) was prefixed a Life.

Lely, SIR PETER, painter, was the son of Captain Van der Faes, nicknamed Du Lys, or Lely, from having been born in a house the front of which was

decorated with a fleur-de-lis. The future painter was born at Soest, in Westphalia, in 1618. He settled in London in 1641 and took to portrait-painting, having hitherto essayed landscapes and historical subjects. He was employed successively by Charles I., Cromwell, and Charles II., the last of whom nominated him court-painter and conferred on him the honour of knighthood. From the death of Vandyck he was the first painter of the day in England down to the arrival of Kneller. Lely, 'a mighty proud man, and full of state' (Pepys), had great skill in execution, especially in painting female portraits, though he failed to master the secrets of individuality. His best-known pieces, apart from portraits of his royal patrons, are the Beauties of the court of Charles II. at Hampton Court. He died in London in 1680.

Leman, LAKE. See GENEVA (LAKE OF).

Le Mans. See MANS.

Lemberg (formerly *Lowenberg*; Polish name 'Lwow'), the capital of the Austrian kingdom of Galicia and Lodomeria, is situated on a small tributary of the Bug, in a narrow basin among hills, 212 miles E. of Cracow. It is defended by a citadel, around which the modern town has grown up. Pop. (1869) 87,109; (1890) 128,419, or whom about 40,000 are Jews, whilst nearly 100,000 speak Polish. Lemberg is the seat of a Roman Catholic, a Greek United, and an Armenian archbishop, and has nearly thirty churches and several monasteries; in the 17th century and earlier it was called the 'town of the monks.' Several of the churches are fine buildings, as the Dominican, which contains a greatly venerated image of the Virgin; the Greek cathedral, built in the Italian style in 1740-79; the Gothic Roman Catholic cathedral (1350-1460); and the Armenian cathedral, dating from the 14th century. The university, founded in 1784 and reorganised in 1817, has more than 900 students. Its library contains 86,000 volumes and 470 MSS. Here also is the seat of the national institute founded (1817) by Ossolin-ski, with a library of 81,000 volumes and 3000 MSS., chiefly of Polish literature, and large collections of medals, coins, antiquities, paintings, engravings, &c. There is a considerable trade in flax, hemp, cloth, leather, and agricultural products. The manufactures embrace machinery, earthenware, oil, beer, &c. Founded in 1259, Lemberg was an important city of Poland from 1340. It has been several times besieged, on the last occasion in 1848. It fell to Austria at the first partition of Poland.

Lemming (*Myodes*), a genus of rodents, nearly allied to voles, but with much shorter ears and tail, larger and stronger claws, and a heavier body. The most noted species is *M. lemmings*, an animal about the size of a rat, with variegated black and tawny fur, an inhabitant of the northern Scandinavian mountains, where it ordinarily feeds on reindeer-moss and other lichens, grass, catkins of birch, &c. Breeding several times in the course of a year, and producing four or five at a birth, it multiplies so much that, periodically, vast troops migrate from their native mountains. They proceed persistently in a straight line according to some always westwards, swimming rivers, crossing mountains, entering towns, devouring, breeding, and dying as they hurry on. They move chiefly in the night or early morning. Bears, wolves, foxes, lynxes, hawks, and owls follow and prey upon them, and most of the survivors finally drown themselves in the sea, thus pitifully readjusting the balance between population and subsistence. For ingenious theories and curious details about the migration, see Romanes, *Mental*

Evolution in Animals (1883). In times of prevalent superstition lemmings were often exorcised by the priests, and the peasantry of Norway supposed them to fall from the clouds. During

Lemming (*Myodes lemmings*).

the Ice Age the lemming extended as far south as the Alps, but it now is distinctly arctic. An allied species (*M. obensis*) occurs in Siberia and North America. Another quite distinct 'lemming' (*Cuniculus torquatus*), inhabiting the arctic regions of both hemispheres, turns white in winter.

Lemnos, a Turkish island in the northern part of the Aegean Sea, is situated 40 miles SE. of Mount Athos and about the same distance SW. of the Dardanelles. It is nearly split in two by a large bay on the south coast and another on the north coast. The interior consists of an undulating plateau. None of the hills exceed 1400 feet in height. Area, 180 sq. m.; pop. about 39,000, all Greeks, except 5000 Turks. The principal products are corn, wine, and tobacco. In antiquity and all through the middle ages the most notable product of the island was the 'Lemnian earth' or 'sealed earth,' which was in general request as an antidote against snake-bites, also as a remedy in cases of plague, dysentery, &c. It was extracted only on one day in the year, August 6, with an accompaniment of religious ceremonies, from a spot near the ruined site of the ancient city Hephæstia, in the north-east of the island. It has now gone out of repute, and very little is extracted every year. It consisted of siliceous to the extent of two parts in three, with some alumina, oxide of iron, water, and natron. In ancient times the island is stated to have possessed an active volcano; at the present date there exist no traces of volcanic action. Lesbos was regarded by the Greeks as sacred to Hephæstus. It was conquered by the Persians in the reign of Darius Hystaspes; but Miltiades wrested it from them for the Athenians. In 1657 it passed into the hands of the Turks, from the Venetians. The chief town is Kastro (the ancient Myrina), a fortified place on the west coast, with 3000 inhabitants. Lemnos is a place of banishment for Turkish political offenders. See *Tozer's Islands of the Aegean* (1890).

Le Moine, JAMES MACPHERSON, Canadian author, was born in Quebec, 24th January 1825, and practised as a successful barrister there for some years, but quitted the active work of his profession in 1858, on being appointed superintendent of Inland Revenue at Quebec. He writes with equal facility in English or French, and is the most prolific author that Canada has produced. He has made special studies of ornithology, archaeology, and other branches of science; and his works

—over thirty in number—include some valuable sketches of Canadian history.

Lemoine, JOHN ÉMILE, French journalist, was born in London on 17th October 1815 of French parents, and joined the staff of the *Journal des Débats* as English correspondent in 1840. Subsequently he was appointed editor of that newspaper, and guided it skilfully and successfully through all the vicissitudes of political strife. In 1876 he was elected a member of the Academy, and in 1888 a life senator. He died 14th December 1892. His *Études Critiques* (1852) and *Nouvelles Études* (1862) contain specimens of his best style.

Lemon, the fruit of a small tree (*Citrus Limonium*) belonging to the same natural order as the Orange (*Aurantaceæ*). The general character of the leaves and flowers and fruit of the lemon-tree is so well illustrated in the accompanying cut that description may be dispensed with. There are many varieties of the lemon, but they may all be included under the following four distinct types: (1) The Common or Genoa Lemon, which is the most plentiful in the shops, (2) The Thin-skinned Lemon, which is of large size, having a thin smooth shining fragrant rind, with an almost entire absence of white spongy matter beneath it. The pulp is very delicate and juicy, with a delicious aroma. (3) The Sweet Lemon, which, while having the external appearance of the lemon, has the pulp sweet like that of the orange. (4) The Citron Lemon, or the Ligurian Lemon of commerce. It is a large

Lemon (*Citrus Limonium*).

oblong fruit, with a thick rough warted rind, which is eatable. The pulp, however, is the least delicate of all lemons.

The peculiar and grateful flavour of the juice of the lemon is mainly due to citric acid. It forms, when properly diluted, an agreeable and refreshing drink (see LEMONADE), and is useful in febrile and inflammatory diseases. The most valuable of its properties, however, is the prevention and cure of scurvy; hence it or the very similar lime juice (see LIME) is an important article in sea stores. The well-known uses of the rind, either fresh or preserved, in the cook's and the confectioner's arts for flavouring and ornamenting dishes, cakes, and candies need only be alluded to, to show the importance of the lemon to civilised man. The essential oil (see below) is obtained from the rind. The lemon is largely cultivated in all the warmer countries of the south of Europe and those bordering on the Mediterranean, and it is naturalised in some parts of South America and in the East and

West Indies, and in parts of Australia. See Bonavia, *The Cultivated Oranges and Lemons of India and Ceylon* (1890).

The *Oil* or *Essence of Lemons* is extracted from the fresh lemon peel either by pressure or by distillation. The former is the usual method. The peel, removed from the fruit, is bent so as to rupture the oil vesicles, and the oil is collected in sponges, or the peel is sometimes rasped with short needles, and the exuding oil collected. The yield is variable, amounting on the average to 10 oz. of oil from 400 fruits. The oil has the same composition as that of turpentine—viz. $C_{10}H_{16}$, but it contains a small quantity of cymene and other oils. While it is often adulterated with turpentine, there is no doubt that the fragrant portion, even in genuine oil, can be removed, leaving about 90 per cent. of liquid having a decided turpentine odour. This fragrant portion, according to some authorities, is an oxygenated substance, and therefore differs distinctly from the bulk of the oil, which has the composition previously stated. Its chief use is as a flavouring agent, the ordinary essence of lemon of the shops consisting of a solution of the oil in alcohol. It also enters into most perfumes, such as *eau de Cologne*, &c.

The so-called *Salt of Lemons*, or *Salt of Sorrel*, is the binoxalate of potash. See OXALIC ACID.

Lemon. MARK, born in London, 30th November 1809, was educated at Chesham near Epsom, and in 1835 wrote a farce, the first of a long series of melodramas, operettas, &c. He produced, moreover, several novels (the best, perhaps, *Falkner Lytle*, 1866), children's stories, and essays, and appeared as a lecturer and public reader. In 1841 he helped to establish *Punch* (q.v.), of which for the first two years he was joint-editor with Henry Mayhew, and thereafter sole editor till his death, which took place at Crawley, Sussex, 23d May 1870. See Joseph Hatton's *Reminiscences of Mark Lemon* (1871).

Lemonade is formed by adding two lemons sliced, and two ounces of white sugar, to a quart of boiling water, and digesting till cold. It is a useful drink for allaying thirst, and as a refrigerant in febrile and inflammatory complaints, and in hæmorrhage, in which cases it should be given iced. Aerated Water (q.v.) flavoured with sugar and essence of lemons is also called lemonade.

Lemon-grass (*Andropogon schouranthus*), a perennial grass, a native of India, Arabia, &c., three to four feet high, and possessing a strong lemon-like fragrance. An essential oil is obtained from it which is used in perfumery. See GRASS-OIL.

Le Moyne, CHARLES, French pioneer, was born in Normandy in 1626, and, proceeding to Canada in 1641, lived among the Huron tribe of Indians, and fought with the Iroquois. In 1668 Louis XIV. made him Seigneur de Longueuil, and afterwards also de Chateauguay. He was for some years captain of Montreal, and died in 1683. Of his eleven sons, nearly all became distinguished. The eldest, Charles, Baron de Longueuil, was born in 1656, and in his youth served in the French army. He was made governor of Montreal and baron in 1700, and became commandant general of the colony. He died at Montreal in 1729. His descendant, Charles Colmar Grant, had his Canadian title of seventh Baron de Longueuil officially recognised by the Queen in 1880. Another son, Joseph, became an officer in the French navy, and in 1694-97 brought vessels to Hudson Bay to co-operate with land forces under his brother Iberville. He subsequently conveyed colonists to Louisiana, surveyed its coast, and aided in capturing Pensacola.

Lemprière, JOHN, was born in Jersey about 1763, and educated at Winchester and Pembroke College, Oxford. He was in turn head-master of Abingdon and Exeter grammar-schools, rector of Meeth in Devonshire and of Newton-Petrock, and died February 1, 1824. His famous *Classical Dictionary* (1792) remained for many years the standard work of reference in England on ancient mythology, biography, and geography. Another work of Lemprière's was *Universal Biography* (1808).

Lemur (Lat. *lemur*, 'a ghost'), a genus which has given its name to a large group of mammals, the lemurs. These animals appear to stand between the Insectivora and the monkeys. The hand with an opposable thumb is fashioned after that of the monkeys, but in most structural features they either show affinities to lower groups or are peculiar. The German name, 'Halb-Affen' ('Half-Apes'),

Ring-tailed Lemur (*Lemur catta*).

as also the term 'Prosimii,' which has been applied to the group, indicates its position at the base of the Primates. The Lemurs are forest-dwellers, and mainly nocturnal in their habits. They can be for the most part readily tamed. One of the chief points of interest attaching to the group is its peculiar geographical distribution. By far the majority of the genera are confined to the island of Madagascar; a few forms are found in the Orient, and on the African continent. Their range from Malaya to Madagascar has been accounted for by the supposed former existence of a continent (for which the name 'Lemuria' was proposed by Mr Selater) connecting these now widely-separated regions. Undoubted remains of these animals have, however, been found in Europe and in America; this of course indicates their wider range in ancient times; the isolation of genera at the present day is therefore probably due to the disappearance of forms occupying the intermediate tracts of country, and no Lemuria is necessary. Besides Lemur, the genera *Indris*, *Propithecus*, *Haplolemur*, *Sepllemur*, *Cheirogaleus*, and the curious and aberrant *Chiromys* (see AYE-AYE) are confined to Madagascar. The *Angwantilo* (*Aictocæbus*) and *Perodicticus* and *Galago* (q.v.) are African. The *Tausier* and *Nycticebus* are found in Malaya, and the *Loris* in Ceylon. Some of the fossil forms show affinities with the Insectivora, others with the Ungulata.

Lemures, the general designation given by the Romans to all spirits of departed persons, of whom the good were honoured as *Lares* (q.v.), and the bad (*Larva*) were feared as capable in their night

journeys of exerting a malignant influence upon mortals. The festival called *Leauria* was held on the 9th, 11th, and 13th of May, and was accompanied with ceremonies of washing hands, throwing black beans over the head, &c., and the pronunciation nine times of these words: 'Begone, you spectres of the house!' which deprived the lemures of their power to harm. Ovid describes the *Leauria* in the fifth book of his *Fasts*.

Leauria. See LEMUR.

Lena, a river of eastern Siberia, rises amid the mountains on the north-west shore of Lake Baikal, in the government of Irkutsk, flows first north-east to the town of Yakutsk, where it is 6½ miles wide, then north to the Arctic Ocean, into which it falls by several mouths, forming a delta 250 miles wide. Its course is 3000 miles in length, the area of its basin 772,000 sq. m. Its chief affluents are the Vilui (1300 miles) on the left, and the Vitim (1400), the Olekma (800), and the Aldan (1300) on the right. Navigation on the Lena is open from Yakutsk upwards from May till October. During spring the waters of the river regularly overflow their banks. The Lena is a principal artery of the trade of eastern Siberia. The riverine sand of the Vitim and Olekma yields richly in gold; salt, coal, iron, copper, and argentiferous lead exist. Large quantities of mammoth ivory have been found in the delta. See G. W. Melville's *In the Lena Delta* (1885).

Lenau, NICOLAUS, the pen-name of NICOLAUS NIEMESCH VON STREHLENAU, German poet, who was born at Czajad, near Temesvar in Hungary, 13th August 1802, and studied law, then medicine, at Vienna. But his was a melancholy nature; the compass of his soul ever trembled back to the pain of life. Although a man of deep feeling, and with a good deal of the true lyric inspiration, his life was rendered unhappy by his morbid poetic discontent. In 1832 he travelled to the United States, hoping to find there the peace and satisfaction which he could not get in Europe; but he returned in the following year a still further disappointed man. From this time he lived alternately in Vienna and in Stuttgart, in the latter city in close intimacy with the writers of the Swabian school (Schwab, Kerner, Mayer). On the eve of his marriage in 1844, he was suddenly struck down by insanity; he lived in an asylum at Oberdöbling near Vienna until his death, on 22d August 1850. Lenau's poetic power is shown to best advantage in his short lyric effusions, especially those (e.g. *Schilflieder*) associated with the land of his birth. His best longer pieces, as *Faust* (1836), *Sarastrofa* (1837), *Die Abtissin* (1842), cannot claim the merits of artistic completeness and unity, in spite of the rich fancy and feeling, and the fiery temper of the poet, displayed in individual passages. His *Sämmtliche Werke* appeared in 4 vols. in 1855, with a biography by Anastasius Grün. See Lives by Schurz (1855) and Frankl (1885).

Lenctos, NIXON DE, one of those characters that could have appeared only in the French society of the 17th century, was born of good family at Paris, 15th May 1616. Even as a child she was remarkable for her beauty and grace. She was carefully educated, spoke several foreign languages, excelled in music and dancing, and had a great fund of sharp and lively wit. At the age of ten she read Montaigne's *Essays*. Six years later she commenced her long career of licentious gallantry by an amour with the Comte de Chatillon to whom succeeded innumerable favourites, but never more than one at a time. Among her lovers we may mention the Marquis de Villareaux, the Marquis de Sevigné, the great Conde, the Duc de Lamoignon, Marshal d'Albret, Marshal

d'Estrees, the Abbé d'Elliat, and La Châtre. She had two sons, but never showed in regard to them the slightest instinct of maternity. The fate of one was horrible. Brought up in ignorance of his mother, he followed the rest of the world, and conceived a passion for her. When she informed him of the relation that subsisted between them, the unhappy youth was seized with horror, and blew out his brains in a frenzy of remorse—a calamity which did not seriously affect Ninon. She was nearly as celebrated for her manners as for her beauty. The most respectable women sent their children to her house to acquire taste, style, politeness. So great was her reputation that, when Queen Christina of Sweden came to Paris, she said she wished particularly to visit the French Academy and Ninon de Lenctos. We may gather some idea of her wit and sense from the fact that Laroche-foucauld consulted her upon his maxims, Molière upon his comedies, and Scarron upon his romances. She died 17th October 1706, at the age of ninety, having preserved some remains of her beauty almost to the last. Mirecourt's *Memoires* is a romance; the letters attributed to her are mostly spurious, but there is a notice of her letters to St Evremont in Sainte-Beuve's *Causeries du Lundi*. See also Capetigue's *Ninon de Lenctos* (Paris, 1864).

Lenecoran, a Russian seaport on the Caspian Sea, 130 miles S. of Baku. In the vicinity are celebrated sulphur-springs. Pop. 5540. It was surrendered to Russia by Persia in 1813. Excavations carried on here in 1890 yielded important prehistoric remains.

Lenecziza, an ancient Polish town, 80 miles WSW. of Warsaw. Pop. 15,546.

Lending. See LOAN.

Lenep, a town of Rhenish Prussia, 18 miles E. of Dusseldorf and 9 S. of Barnem, with manufactures of cloth, iron, &c. Pop. 8844.

Lenep, JACOB VAN, born at Amsterdam, 25th March 1802, is proudly called by his countrymen the 'Walter Scott of Holland.' The son of a professor of rhetoric who was distinguished as a Latinist and as a poet, he was educated for the bar, passed as a barrister, and soon achieved a great reputation for legal knowledge. Yet without neglecting his extensive practice he for more than thirty years cultivated literature with assiduity and success. Lenep first appeared as an author shortly before 1830 in a work on national legends, immediately followed by his comedies. His most popular works have been comedies, *Het Dorp aan die Grenzen* and *Het Dorp over die Grenzen*. Of his numerous novels several (including *The Rose of Dekema* and *The Adopted Son*) have been translated into English, French, and German. He wrote much for the stage, translated from Byron and other English poets, and published a Dutch history for the young. He died August 25, 1868.

Lennox (*Leenachs*, 'fields of the Leven'), an ancient Scottish territory, comprising the basin of the Leven and Loch Lomond—the whole of Dumbartonshire, great part of Stirlingshire, and portions of Perth and Renfrew shires. It gave name to an earldom (1174–1581), and then to a dukedom, conferred by Charles II. (q.v.) in 1680 on one of his illegitimate sons, Charles, Duke of Richmond and Lennox, who in 1702 sold the Lennox estates to the Marquis of Montrose. See GORDON; and *The Lennox*, by Sir W. Fraser (3 vols. 1874).

Lennoxtown, a village of Stirlingshire, 11 miles N. by E. of Glasgow by rail, with bleach works, print-works, and alum-works. Pop. 2838.

Lenormant, FRANÇOIS, an archaeologist and scholar of altogether exceptional genius, was born in Paris, 17th January 1817, the son of Charles

Lenormant (1802-59), himself profoundly learned in Egyptology, numismatics, and archaeology generally, moreover, a fearless defender of the faith. The boy was early initiated into the studies of his life, at twenty carrying off the prize in numismatics of the Academie des Inscriptions with his *Essai sur la Classification des Monnaies des Lagides* (1856). At twenty-three he was digging at Eleusis, and his explorations he continued, in the intervals of his work as sub-librarian at the Institute (1862-72), and professor of Archaeology at the Bibliothèque Nationale (1874-83), until his robust health finally broke down in Calabria from sheer over-work, together with the effects of a wound received when serving as a volunteer during the siege of Paris. He returned to Paris to die—a true martyr to science—December 9, 1883. Perhaps there was never a scholar who gained laurels from so many fields as Lenormant, and certainly no man ever brought to the study of the past a greater combination of exhaustive learning, wide grasp of detail, and brilliant intuition, with unwearied enthusiasm and luminous power of exposition. From numismatics and archaeology proper he passed perhaps too easily to Assyriology, comparative philology, ancient history, and biblical antiquities; still, he has left behind works of the greatest interest and value in these widely different fields. His divination rather than discovery of the existence of a non-Semitic element in the language of the cuneiform inscriptions—the Accadian—was perhaps his greatest contribution to science, but it was difficult to overpraise his essay on the propagation of the Phœnician alphabet, and his great and brilliant constructive work—one of the best attempts ever made to buttress the historical value of the early books of the Bible—*Les Origines de l'Histoire d'après la Bible* (3 vols. 1880-84).

Other works are *Manuel d'Histoire Ancienne de l'Orient* (3 vols. 1868-69; 9th ed. 1881, with a 4th vol. by Babalon, 1885); *Lettres Assyriologiques* (5 vols. 1871-79); *Les Premières Civilisations* (2 vols. 1874); *Les Sciences Occultes en Asie* (2 vols. 1874-75); *La Monnaie dans l'Antiquité* (3 vols. 1878-79); *Monnaies et Médailles* (1883); and *La Grande Grèce* (3 vols. 1881-84) and *A travers l'Apulie et la Lucanie* (2 vols. 1883).

Lens. A town of France, in the department of Pas-de-Calais, 17 miles by rail SW. from Lille. Here are coal-mines, sugar factories, sail-works, &c. Pop. (1891) 13,862. At Lens Condé defeated the Archduke Leopold on 20th August 1648.

Lenxes. A lens is a piece of glass so shaped as to refract rays of light really or apparently radiating from a point, and make them deviate so as to pass, or to travel on as if they had passed, through another point. Every system of lenses, however complicated and whatever be the mutual distances of the lenses, will, if the whole be centred on a common axis, produce a real image somewhere in front of, or else will appear to produce a virtual image somewhere behind, the last refracting surface. The rays on being traced through the complex combination—e.g. a telescope—undergo numerous deviations; ultimately there is a deviation which might have been equally produced by an *equivalent lens*; equivalent, however, in no other sense than as producing an equal ultimate deviation, for the image is not formed in the same place as the single 'equivalent lens' would have formed it in. The system of lenses is approximately equivalent in its action to a simple lens plus a determinate shifting of the focus. Hence a simple lens diagram, modified so as to represent this shifting, will represent the aggregate effect of the most complex system of lenses. When the subject was looked at from this point of view it was found by Gauss, followed up by Listing, that the whole theory of lenses can be treated generally; the most complex system of

lenses can be replaced in every case by a region of space traversed by the common axis of the lenses, at right angles to which axis there are six characteristic planes, the relative positions of which to some extent depend upon the refracting media and their forms and mutual distances, but which also present certain invariable properties and mutual relations. These six planes are (1) the incidental focal plane, F, (fig. 1); (2) the incidental principal plane, P, and (3) the incidental nodal plane, N; (4, 5, and 6) the refractive principal, nodal, and focal planes, P', N', and F'. The principal properties of these planes are: all pencils of rays

Fig. 1.

converging from any point on the incidental focal plane F (provided in this as in all other cases that no ray is so far from the axis as to give rise to spherical aberration) emerge parallel to one another; conversely, all rays incident parallel to one another come to a focus at a point in the second focal plane F'. An object on one principal plane, P, has an equal-sized image on the other, P'. Any ray appearing on incidence to make for the point where one nodal plane, N, cuts the axis, emerges parallel to its former course, but apparently coming from the corresponding point in the second nodal plane, N'. Rays arriving parallel to the axis pass on emergence through the axial point of the focal plane F'; rays passing through the corresponding point in plane F emerge parallel to the axis. These axial points are the Foci of the lens-system. These properties are diagrammatically shown, with exaggeration of the distances of the rays from the axis, in fig. 1.

In this diagram the six planes are represented as equidistant; they are generally not so; their

Fig. 2.

position has to be calculated. The calculation (see Pendlebury, *Lenses and Systems of Lenses*) necessitates the use of standard formulae involving

continued fractions; the physical principle underlying these is that the image (real or virtual) produced by one refracting surface is taken as the object of the next, and so on in succession until the position and deviation of the emergent rays is established. The fixed relations between the mutual distances of these planes are: $FN = PF'$; $F'N' = PF$; and $PF = F'P'/\mu$, where μ is the ratio between the refractive index of the final and that of the original medium. The matter is greatly simplified when, as in the ordinary case, the final and the original media are the same (lens or telescope in air); then $\mu = 1$, each nodal plane coincides with the corresponding principal plane, and $FP = F'P'$. The diagram takes the form indicated by fig. 2. If we come now to the simplest case, that of a single thick lens in air (fig. 3), the standard formulae, according to this method, are $AF = -\mu rr' / (\mu - 1) - tr / \Delta(\mu - 1)$; $AF' = \mu rr' / (\mu - 1) - tr' / \Delta(\mu - 1)$; $AP = -tr / \Delta$; $AP' = -tr' / \Delta$; and $PF = -PF' = -\mu rr' / \Delta(\mu - 1)$; where Δ stands for $\frac{1}{2}\mu(r' - r) + (\mu - 1)t$. In these formulae r is the radius of the A surface, measured towards the centre and towards the right; r' that

Fig. 3.

of the A' surface, measured in the same way; t is AA' , the thickness of the lens; μ is its refractive index as compared with that of the surrounding medium (air) = 1. As an example, let us apply these formulae to a biconvex lens of crown-glass, $\mu = 1.500$; let the radii be $r = +4$ inches at A and $r' = -6$ (negative because measured to the left) at A'; and let the thickness be 1 inch. Putting these numerical values instead of the letters in the formulae, we get $AF = -4.69$ inches; F is 4.69 inches from (to the left of) the A surface. $AF' = +4.55$ inches; F' is 4.55 inches from A'. $AP = -0.28$; the principal plane is to the right of A, inside the lens. $AP' = -0.41$; the second principal plane is to the left of A', inside the lens. The two principal planes are therefore both inside the lens, 0.31 inch apart, and are nearer the more curved face of the lens. The distance $FP = F'P'$, between either focus and the corresponding principal plane, is 4.96 inches, and this is the focal distance or the focal length of the lens; this, not the distance between the focus and the centre or the surface of the lens. The two focal distances are equal; hence if we could by reversing the lens make the principal planes exchange places, the action of the lens would be the same in both positions; but this cannot be done with an unsymmetrical thick lens by simply reversing it in its setting, on account of the unsymmetrical position of the planes within the lens. If we take the ten

Fig. 4.

cases in which the lenses are respectively: (1) biconvex (r positive, r' negative; equiconvex if $r = r'$); (2) planoconvex ($r = \infty$ and $r' < 0$); r'

(negative); (3) convexo-plane ($r +, r' = \infty$, $r' = 0$); (4) biconcave ($r -, r' +$); (5) planoconcave ($r = \infty, r' +$); (6) concavo-plane ($r -, r' \infty$); (7) convex meniscus ($r +, r' +, r'$ greater than r); (8) concave meniscus ($r -, r' -, r$ numerically greater than r'); (9) convexo-concave ($r +, r' -, r$ greater than r'); (10) concavo-convex ($r -, r' -, r'$ numerically greater than r)—we find, on giving the proper signs to the respective terms in the standard formulae above, that in lenses with a flat face one of the principal planes coincides with the vertex of the curved surface; that in all double concave and practically in all double convex lenses the principal planes are within the lens itself; that in lenses 7 and 8 the planes lie outside the convex face until the concave face is flattened so far as to draw one of them upon the lens; and that in lenses 9 and 10 the planes lie outside the concave surface until its curvature increases so far as to draw the nearer plane into the lens. We also find that in all simple lenses whose edges are thinner than their centres PF is negative (i.e. F is to the left of P), and the lens makes parallel rays incident upon it to converge upon some point in the opposite focal plane; while in thick-edged lenses PF is positive and P'F' negative, and the planes lie in the order F'P'PF, those rays which were parallel before incidence being divergent on emergence, and holding a course as if they had come from some point on that focal plane which lies on the same side of the lens as the source itself. When the incident rays are parallel to the axis and to each other, on emergence they converge really upon the opposite focus of a thin-edged lens or appear to diverge from the virtual focus of a thick-edged lens.

When the incident rays diverge from a point not on the focal plane they come to a focus at a definite point elsewhere than on the second focal plane.

Fig. 5.

Fig. 5 diagrammatically illustrates this for a convergent lens. A pencil from X converges on X'; the geometry of the figure shows (by similar triangles) that $FP/XP + P'P'/X'P' = 1$. Hence, if PF or $P'F'$, the focal length, be written f , and the distances XP and $X'P'$ be written d and d' , then, numerically, $f(1/d + 1/d') = 1$. Fig. 6 illustrates

Fig. 6.

the same thing for a divergent lens: $FP/XP - P'P'/X'P' = -1$, or, numerically, $f/d - f/d' = -1$.

These equations give, numerically, the relations between d and d' , the distances of the object X and the image X' respectively from the corresponding principal planes P and P'. The general numerical formula which covers these relations is that if $d = XP$ and $d' = X'P'$ and $PF = P'F' = f$, f being taken as numerically negative in convergent and positive in divergent lenses, then

$$f \left(\frac{1}{d} + \frac{1}{d'} \right) = -1.$$

If an object occupy a plane passing through X at right angles to the axis, the corresponding image will (aberration apart) be in a similar plane passing through X'. Fig. 7 shows rays from three points of an object passing through the nodal points P and P' and emerging parallel to their former courses.

Fig. 7.

The size of the image is easily seen to be to that of the object as d' is to d . In a convergent lens the image of a distant object is inverted and *real*: there is a real crossing of rays in the image, and the real image is formed suspended, as it were, in space, invisible from points not in the path of the rays; a screen of card, of ground glass, or of tissue paper may be placed so as to coincide with the real image, which then becomes visible on the screen: if the eye be removed to a sufficient distance in the path of the rays the inverted real image in space itself becomes visible as an object in space between the lens and the observer, an inverted reproduction of the original object; and this inverted copy is, for all distances between the object and the lens exceeding twice the focal length, smaller than the original object, and for all such distances between twice and once the focal length it is greater than it. When the object is placed within the focal distance d is less than f , and d' is therefore numerically negative; the image is *virtual*; no screen will at any place receive an image; but the rays come to the eye *as if* they had proceeded from a larger object more remote from the lens on the original side of it; whence such lenses are commonly employed as magnifying glasses. Whenever the image formed is a real one the object and the image are interchangeable; an object placed in the position of the real image will produce a real image on a screen placed in the position of the original object. A comparison of fig. 6 with figs. 5 and 7 will show that the virtual image formed by a divergent lens is smaller than the object and is not inverted.

In all these cases the lenses are supposed to have an appreciable thickness. If, however, we assume that the thickness is negligible, the formulae given above are modified by suppression of all terms containing t ; they become simply $PF = AF = f = -r'r' / (\mu - 1)(r' - r)$, or $1/f = -(\mu - 1)(1/r - 1/r')$; and $AP = 0$. Whence the principal planes coalesce and blend with the surfaces; and the ordinary lens-formulae are obtained, in which f , the focal distance, means half the distance between the two focal points. The result is only approximate, as the numerical example already discussed will show when treated in this way. There $r = +4$; $r' = -6$; $\mu = 1.500$; whence $f = -\frac{1}{2} \left\{ \left(\frac{1}{4} + \frac{1}{6} \right) \right\}^{-1} =$

-4.8 inches, and the distance between the two foci is inferred to be 9.6 inches; whereas we have previously seen this distance (including PP') to be 10.24 inches. On the assumption now made, a lens is reversible; for in the formula we find that when the radii exchange places both change their signs, the result being the same. On giving the proper signs and numerical values to r and r' in the simplified formula, it is easy to arrive at the numerical value of f for a lens of any form: if f be negative, the lens is convergent (thin-edged); if positive, it is divergent. Then, f having been found, the relation between f , d , and d' can be found by giving d and f their proper signs and numerical values in the general equation $f/d + f/d' = -1$. If we find d' negative we infer a virtual, if positive a real image. For example, a crown-glass lens ($\mu = 1.500$), biconcave; $r = -4$ inches;

$$r' = +4; 1/f = -(1.5 - 1) \left(-\frac{1}{4} - \frac{1}{4} \right) = +\frac{1}{4}; f =$$

$+4$, a divergent lens. Object at distance, say, $d = 196$ inches; $\therefore d' = -196.50 = -3.92$ inches; a virtual image, smaller than the object in the ratio of 3.92 to 196, or one to fifty. Again, a similar lens, but biconvex; $r = 4$; $r' = -4$; $\therefore f = -4$ inches, a convergent lens. Let the object be at 204 inches; $d = 204$; $f = -4$; $\therefore d' = 4.08$ inches—a real image, smaller in the ratio of 4.08 to 204, or one to fifty. Let the object be at $d = 31$ inches; $\therefore d' = -28$ and the image is virtual, enlarged in the ratio of $28/31$, or eightfold, by the use of the lens as a magnifying glass. The nearer the object to the focus the greater the enlargement. To make the image equal in size to the object, d must be equal to d' ; then $-f/d + -f/d = -1 = -2f/d$; and $d' = d = 2f$. With a convergent lens adjust the positions so that the object and its image on a screen are of the same size; then they are at a distance of four times the focal length from each other. In this way, neglecting the thickness, the focal length of a convergent lens may be ascertained. It may also be ascertained by means of an object (spider-threads or a piece of muslin), and a telescope focussed for a very distant object; direct the telescope towards the spider-threads; interpose the lens to be examined; shift it until the spider-threads are distinctly seen in the telescope; the spider-threads are then in the focus of the lens, which causes the rays from them to pass parallel into the telescope. A divergent lens has its focal length measured by conjoining it with a convergent one, which neutralises or overbalances its effect; if $-F$ be the focal length of the convergent combination, $-f$ that of the convergent lens, and f' (unknown) that

of the divergent lens, $-\frac{1}{f} + \frac{1}{f'} = -\frac{1}{F}$; the deviation produced by a lens is inversely proportional to its focal length, and the equation states the proposition that the convergence produced by the one, together with the divergence produced by the other, is equal to the convergence produced by the combination.

When the light from an object is mixed the refractive index μ differs for each colour; the distance of the image is different for each spectral colour; thus a series of images are formed behind one another, the violet in front and the red behind; those behind are larger and overlap, and therefore the image appears to have a spectral fringe of colour, red outside. To prevent this chromatic aberration images of two or more colours, say the blue and orange, should be brought to the same plane and be of the same size; this is done for two colours or wave-lengths by combining a crown-glass convergent of excessive power with a flint-glass divergent lens; the curvatures are so chosen that the spectral dispersion produced by the one

is compensated by the re-combination produced by the other; but, since in the two materials the refractions and dispersions are not proportional to one another, there remains a balance of deviation accomplished without chromatic dispersion. Newton thought dispersion and deviation to be always proportional to one another, and achromatism therefore impossible; Dr Hall in 1733 found this not to be so, and made achromatic lenses, but did not publish his discovery. Dollond in 1757 first introduced achromatic lenses. When two colours are achromatised there is still some chromatic aberration as regards the rest; to bring a greater number of colours to the same focus requires a greater number of refracting surfaces.

In all the preceding it has been assumed that the lenses are narrow, or that the pencils of rays fall on the centre of the face, and that the objects are small. When the object is viewed by the lens under a wide angle a plane object gives an ellipsoidal, paraboloidal, or hyperboloidal image, which, when real, cannot be wholly received in focus upon a plane screen; and oblique rays fail to converge upon precise points, and hence, even on a screen so curved as to receive the oblique pencils of rays when at their greatest concentration, the image will not be equally distinct all over. Further (spherical aberration), if the lens be too wide, or its curvature too considerable, the rays falling on different zones of the lens are, as it were, received by prisms of different angle; those incident on exterior zones are more sharply refracted than those nearer the axis, and their focus lies at a point some distance nearer the lens than the geometrical focus (longitudinal aberration), and the image is thus distorted, so that the image of a square object formed by a single convex lens appears to be drawn out at the corners, and that formed by a concave lens appears to have its corners squeezed in; besides which there is blurring, for pencils incident near the edge have their foci not even on the axis, but short of it. To remedy these defects, which cannot all be thoroughly dealt with at the same time, various 'aplanatic' combinations of lenses of different curvatures have to be employed to build up a compound 'equivalent lens'; and these combinations have to be adapted to the particular purpose for which the lens-system is to be used (see Parkinson's and Coddington's *Optics*). The property of refracting light-rays possessed by lenses necessarily applies also to heat and actinic rays; whence the use of lenses as burning-glasses (in which parallel heat-rays from the sun are brought to a focus at the principal heat-focus of the lens) and photographic lenses. The heat-focus is somewhat farther, the actinic focus somewhat nearer to the lens than the light-focus is; but, by the application of the principles of correction for chromatic aberration, the visual and the actinic foci are, in the last case, made to coincide.

Lent (A.S. *Leuten* = Ger. *Lenz*, 'the spring'; Gr. *Tessaraktoste*; Lat. *Quadragesima*—hence Ital. *Quaresima*, Sp. *Cuaremas*, Fr. *Carême*), the period of fasting before Easter. Such an observance was old even in the days of Irenæus, but without any uniformity—some fasted one day, others two; but the period was gradually extended by the 4th century to about forty days. The Greeks from the 6th century have commenced their abstinence from meat on the Monday in Sexagesima week, and from cheese, &c. on the Monday in Quinquagesima week; Sundays and Saturdays and the Feast of the Annunciation being deducted. In the West only Sundays were excepted from the fast, which sometimes began with Sexagesima or Quinquagesima, until, in the 8th or 9th century, it was finally fixed to commence with Ash Wednesday (q.v.), between which day and Easter Sunday (omitting the Sun-

days, on which the fast is not observed) forty clear days intervene. The rigour of the ancient observance, which excluded all flesh, and even the so-called 'white meats,' is now much relaxed; but the principle of permitting but one meal, with a slight refectory or collation, is everywhere retained. In the Anglican Church Lent is retained as a church season of the calendar, with special services, and proper collects and prayers; but the observance of the fast is left to the discretion of each individual. See **FAST**; also **HOLY WEEK**.

Lenthall, WILLIAM (1591-1662), barrister, was born in Henley, entered St Alban Hall, Oxford, and was Speaker of the Long Parliament (1640-53). He was again made Speaker in 1654, and in 1656 became one of Cromwell's peers.

Lentibulariaceæ, a natural order of exogenous plants, allied to Primulaceæ. It has also intimate relations with Scrophulariaceæ. It contains nearly 200 known species, all herbaceous, and all living in water or marshes. They abound chiefly in the tropics. A few species of Bladderwort (see **INSECTIVOROUS PLANTS**) and Butterwort (q.v.) are its only representatives in Britain.

Lenticels. See **BARK**.

Lentil (*Ervum lens*), an annual plant belonging to the natural order Leguminosæ. It is a native of the countries bordering on the Mediterranean, and has been cultivated from the very earliest times. In Egypt and Syria it is still made into pottage, and another favourite mode of cooking it in those countries is by parching it in a frying-pan. The lentil is extensively cultivated in the warmer parts of Germany, France, and the south of Europe generally. It is also cultivated to some extent in Asia. The Hindus, in common with the Egyptians, regard it as the best food on which to undertake long journeys or laborious work. Flour of lentils is highly nutritious and contains, according to Playfair, more nitrogenous matter than any other edible leguminous plant. Einhoff found in 3840 parts of lentils 1260 parts starch and 1433 parts analogous to animal matter. The foods known as *Revalenta arabica* and *Erculenta arabica* (words compounded of the botanical name of lentil) are simply specially prepared forms of the flour of lentils, in no way superior to the ordinary flour which can be purchased at greatly less prices. Mixed with peas in the making of pea-soup, lentils diminish the tendency to flatulence, and lentil soup is much esteemed by vegetarians and others in Britain. By Roman Catholics lentils are eaten during Lent, both in soups and in the form of haricot, as a substitute for flesh-food. The lentil is a weak, straggling plant, rarely exceeding 18 inches high, often much more dwarfed, having pinnate leaves terminating in tendrils. The flowers are white, lilac, or pale blue, small, and formed like those of a pea. There are three varieties of lentil recognised in the countries in which it is cultivated: the small brown, which is

Lentil.

the lightest flavoured and the best esteemed for soups and haricots; the yellow variety, which is slightly larger; and the lentil of Provence, which has seeds as large as a small pea, but is better appreciated as fodder for cattle than for the grain as food for man. It has been frequently suggested that lentil might be grown as an agricultural crop in Britain, and its cultivation has been attempted, but without success, not so much from deficiency of warmth as from excess of atmospheric moisture. It is sown at the rate of about 1½ bushel per acre, and its cultivation and harvesting are similar to those of the Tare (q.v.), to which it is related. The produce in grain is fully a fourth less than that of the tare, and in respect of straw it does not yield a third of the weight of that crop. The grain, however, on the Continent sells at twice the price of peas.

Lentini, a town of Sicily, stands east of Lake Lentini, near the site of the ancient Leontini, 17 miles by rail S. by W. of Catania. Pop. 12,740.

Leo, the fifth sign of the Zodiac (q.v.).

Leo, the name of thirteen among the popes of the Roman Catholic Church, of whom the following call for particular notice.—**LEO I.**, surnamed 'the Great,' who is held a saint of the Roman Catholic Church, and is one of the most eminent of the Latin Fathers, was born of a distinguished family at Rome about the end of the 4th century. On the death of Sixtus III. in 440 Leo was chosen as his successor. It is in his pontificate that the regular series of papal letters and decretals may be said to commence. Leo's letters, addressed to all parts of the church, exhibit prodigious activity and zeal, and are used by Roman controversialists as an evidence of the extent of the jurisdiction of the Roman see. In a council held at Rome in 449 he set aside the proceedings of the Council of Ephesus, which had pronounced in favour of Eutyches (q.v.), summoned a new council at Chalcedon, in which his legates presided, and in which Leo's celebrated 'Dogmatical Letter' was accepted 'as the voice of Peter.' He interposed with Attila (q.v.) in defence of the Roman city and people, and subsequently with Genseric (q.v.). Leo died at Rome in 461. His works, the most important of which are his Letters and Sermons, were first printed in 1479, and afterwards by Quesnel (2 vols. Paris, 1675); but much better editions are those of Cacciani (1733-55) and Ballerini (1757). See books by Arendt (1835), Perthel (1843), Saint-Geron (1846), Gore (1889), and Felton (*Lib. Fathers*, xii., 1896).

The pontificate of **LEO III.** is chiefly noticeable as the epoch of the formal establishment of the Empire of the West. He was a native of Rome, and succeeded Hadrian I. in 795. During the greater part of the 8th century the popes, through the practical withdrawal of the Eastern emperors, had exercised a temporal supremacy in Rome, which was fully recognised by the gift of Pepin, and placed under the protectorate of the Frank sovereigns, who received the title of Patrician. The pontificate of Leo, however, was a troubled one, and in 799 he was treated with much violence, and obliged to flee to Spoleto, whence he afterwards repaired to Paderborn, in order to hold a conference with Charlemagne. On his return to Rome he was received with much honour by the Romans, and the chiefs of the conspiracy against him were sentenced to banishment. In the following year (800) Charlemagne, having come to Rome, was solemnly crowned and saluted emperor by the pope, and the temporal sovereignty of the pope over the Roman city and state was formally established, under the suzerainty, however, of the emperor. In 804 Leo visited Charlemagne at his court at Aix-la-Chapelle. With Charlemagne's

successor, Louis le Debonnaire, Leo was embroiled in a dispute about the right of sovereign jurisdiction in Rome, which had not been brought to a conclusion when Leo died in 816.

LEO X., Giovanni de' Medici, the second son of Lorenzo the Magnificent, was born at Florence in December 1475. From his cradle he was destined to the ecclesiastical career. His education was entrusted to the ablest scholars of the age; and through the influence of his father with Pope Innocent VIII. he was created cardinal at the unprecedented age of thirteen years, in 1488. In the expulsion of the Medici from Florence, after the death of Lorenzo, the young cardinal was included, and he used the occasion as an opportunity for foreign travel. He was employed as legate by Julius II.; and during the war with the French he was taken prisoner in the battle of Ravenna, but soon afterwards effected his escape. On the death of Julius II., in 1513, Cardinal de' Medici was chosen pope at the early age of thirty-seven, under the name of Leo X. His first appointment of the two great scholars Bembo and Sadoleto as his secretaries was a pledge of the favour towards learning which was the characteristic of his pontificate; but he did not neglect the more material interests of the church and the Roman see. He brought to a successful conclusion the fifth Council of the Lateran (see COUNCIL) and the schism which was threatened by the rival Council of Pisa. He concluded a concordat with Francis I. of France, which continued to regulate the French church till the Revolution. In the political relations of the Roman see he consolidated and, in some degree, extended the re-conquests of his warlike predecessor, Julius II., although he also used his position and his influence for the aggrandisement of his family. His desertion of the alliance of Francis I. for that of his rival, Charles V., although the subject of much criticism, was dictated by a sound consideration of the interests of Italy. But it is most of all as a patron of learning and art that the reputation of Leo has lived with posterity. Himself a scholar, he loved learning for its own sake; and his court was the meeting-point of all the scholars of Italy and the world. He founded a Greek college in Rome, and established a Greek press, which he endowed munificently (see RENAISSANCE). In the encouragement of art he was no less munificent. Painting, sculpture, architecture were equally favoured; and it is to his vast project for the rebuilding of St Peter's, and to the step to which he had recourse for procuring the necessary funds—his permitting the preaching of an indulgence, one of the conditions of obtaining which was the contribution to this work—that the first rise of the Reformation in Germany is ascribed. He himself seems to have regarded the movement as of little importance, describing it as 'a squabble among the friars;' and though he condemned the propositions of Luther, and issued a commission to inquire into his doctrines, his measures on the whole were not marked by much severity. His personal habits were in keeping with his taste—splendid and magnificent in the highest degree; but in his moral conduct he maintained a strict propriety, and his character, although not free from the stain of nepotism, the vice of that age, and more modelled on the ideal of an enlightened prince than on that of a zealous and ascetic churchman, was beyond all imputation of unworthiness or irregularity. His death, which occurred rather suddenly on 1st December 1521, during the public rejoicings in Rome for the taking of Milan, was by some ascribed to poison; but there seems no solid reason for the suspicion.

Leo's X. Regesta (1884 *et seq.*); Ranke, *History of the Popes*; Symonds, *Renaissance in Italy* (1875-86); M. Creighton, *History of the Papacy during the Period of the Reformation* (vols. iii, iv, 1887-91).

LEO XIII., the 258th Roman pontiff, was born at Carpineto, the son of Count Ludovico Pecci, 21 March 1810. Educated first at the Jesuit College of Viterbo and the schools of the Collegio Romano, he proceeded to the College of Noble Ecclesiastics. He greatly signalised himself in mathematics, physics, and philosophy. In 1830 he sustained a public disputation in the last-named branch of learning, and carried off the first prize. He also frequented the schools of the Roman University to learn canon and civil law. Having become Doctor of Laws, he was appointed by Pope Gregory XVI. a domestic prelate and Referendary of the Segnatura in 1837. He then took holy orders, received from the pope the title of protonotary apostolic, and was appointed in succession apostolic delegate at Benevento, Perugia, and Spoleto. He was a vigorous administrator, and while at Benevento put a stop to brigandage. Sent to Belgium as nuncio in 1843, he was created archbishop of Damietta to qualify him for the office. Three years later he was nominated archbishop of Perugia, and in the consistory of December 19, 1853, he was created a cardinal by Pius IX. He was a member of several of the congregations of cardinals—including those of the Council of Rites and of Bishops and Regulars—and in September 1877 he was selected by the pope to fill the office of Cardinal Camerlengo of the Holy Roman Church. In that important capacity he had control of all business except foreign affairs. Upon the death of Pius IX. in 1878 Cardinal Pecci was elected as the representative of the Moderates. He assumed the title of Leo XIII., and adopted an opposite policy to that of his predecessor. He restored the hierarchy in Scotland, and composed the religious difficulty with Germany, so that when a dispute arose in 1885 between Germany and Spain as to the ownership of the Caroline Islands he was requested by Prince Bismarck to act as arbitrator. In political matters Leo has permitted the Irish bishops to indulge their own views. In May 1888 the pope issued a decree denouncing the methods adopted in the Irish Plan of Campaign. He has manifested enlightened views in many directions, but on questions affecting the church and his own status as pontiff he has held staunchly to his rights. He regards himself as the deposed sovereign of Rome, and as a prisoner at the Vatican; has refused the income voted him by the Italian parliament; and persistently declines to recognise the law of guarantees. He has protested against heresy and 'godless' schools, and in his encyclicals has affirmed that the only solution of the socialistic problem is the influence of the papacy. He constrained the French clergy and the French monarchists to accept the republic, but encouraged the Hungarian Catholics to oppose the civil marriage law (1894). In 1883 he opened the archives of the Vatican for historical investigations, and he has made himself personally known as a poet, chiefly in the Latin tongue. The jubilee of his episcopate in 1893 was celebrated with even greater pilgrimages to Rome, congratulatory addresses, &c., than that of his priesthood in 1887. In 1896 he issued an encyclical pronouncing Anglican orders null and void.

Leo III., 'the Isaurian,' ruler (718-41) of the Byzantine Empire (q.v.).

Leo Africanus (properly ALHASSAN IBN MOHAMMED ALWAZZAN), a Cordovan Moor, who at the close of the 15th century made extensive travels in northern Africa and Asia Minor. Falling into the hands of pirates, he was sent to Rome, and accepted Christianity; but afterwards he returned to his old faith. He left an account of his African travels in Italian, which, first printed by Ramusio in 1559, was for long the chief source of information as to the Soudan.

Leobschütz, a town in Prussian Silesia, 24 miles by rail NW. of Ratibor, has large corn-markets. Pop. (1875) 11,425; (1895) 12,604.

Leochares, one of the most distinguished sculptors of the Attic school of the 4th century B.C., was a pupil of Scopas, and Pliny ascribes to him the sculptures on the west side of the Mausoleum (q.v.). He was one of the privileged artists who were permitted to make portraits of Alexander the Great. Three statues of Zeus are known to have been executed by him. His 'Ganymede carried off by an Eagle' was famous throughout the ancient world. In collaboration with Lysippos he produced a colossal group in bronze, which represented Alexander at a lion-hunt, while he himself was responsible for chryselephantine statues of Alexander and his family. The works of Leochares are all lost, but there is a copy of the Ganymede in the Vatican; and a bust of Alexander may be a copy of one of his.

Leo Hebraeus. See ABARBANEL.

Leominster (pronounced *Lemster*), a market-town of Herefordshire, on the Lug, 13 miles N. of Hereford. A monastery was founded here in 658; and the fine church of a later priory presents every style from Norman to Perpendicular. It was restored by Sir G. G. Scott in 1866, and enlarged in 1879. The quaint old timber Butter Cross (1633) was in 1855 transferred to a new site to make room for an Italian town-hall; there is also a coin exchange (1859). Leather gloves are the staple manufacture, and there is a great trade in hops and cider. Incorporated as a municipal borough by Queen Mary, Leominster till 1868 returned two members, and till 1885 one. Pop. (1851) 5214; (1881) 6044; (1891) 5675. See histories by Price (1795) and Townsend (1863).

Leon, an ancient kingdom of Spain, equivalent generally to the modern provinces of Leon, Palencia, Valladolid, Zamora, and Salamanca. It was the earliest Christian kingdom, next after Asturias, to be formed in Spain, after the Moorish wave of conquest began to recede. It dates from the 10th century, and was united with Castile first by Ferdinand the Great in 1037, and finally in 1230. The modern *province* has an area of 6165 sq. m. and (1887) a pop. of 380,229. The country, which is intersected by the Douro and the Minho, is mountainous, being invaded on the north by the Cantabrian Mountains. The soil is generally fertile. The inhabitants are for the most part uneducated and lazy, but honourable, hospitable, and good-natured; they have many peculiar customs, and all the pride of pure Spanish descent. In the high districts south of Salamanca there are remnants, as is believed, of the old Gothic tribes, and at Astorga the *Maragatos* are variously supposed to be descendants of the Celtiberi, the Visigoths, or the Moors.—Leon is also the name of a part of BRITANNY.

Leon (the *Legio septima gemina* of the Romans), capital of the former kingdom and of the modern province of the same name, but now a sleepy agricultural town, is situated in a plain, 256 miles

by rail NW. of Madrid. The beautiful cathedral (c. 1195-1512), a specimen of the purest Early Pointed, is French in character and probably in origin, but was so much 'restored' during 1855-86 that it is hard to say what is old and what modern; it contains the tombs of many sovereigns of Leon, saints, and martyrs. Leon is the centre of the Spanish linen-manufacture, and has a celebrated horse-fair; it was formerly the chief seat of the Spanish wool-trade. Pop. 13,446.

Leon, a city of Nicaragua, on an extensive plain, 32 miles by rail (1882) SE. of its port, Corindo. Once the boast of Spanish America, founded at the head of Lake Managua in 1523, removed hither in 1610, and sacked by Dampier in 1685, it is now partly in ruins, and of its noble buildings only the churches remain. The massive cathedral has been several times employed as a citadel during the civil wars, but has suffered very little. Pop., including the contiguous Indian pueblo of Subitaba, about 25,000.

Leon, PONCE DE. See PONCE DE LEON.

Leonardo da Vinci, painter, sculptor, architect, and engineer, was born in 1452, at Vinci, a village in the Val d'Arno, between Pisa and Florence, the natural son of Ser Piero Antonio da Vinci, notary to the Signoria of Florence. His mother, named Caterina, afterwards married a villager of Vinci. He was educated in his father's house, and soon began to show signs of that bright and versatile genius which distinguished him through life. As a child he was especially remarkable for his aptitude for arithmetic, and for his skill in music and drawing. About 1470 he was placed by his father in the studio of Andrea del Verrocchio, by whom he was instructed in painting and modelling, and where he had Perugino and Lorenzo di Credi as fellow-pupils. So rapid was his progress that before long he began to take part in the production of his master's pictures, and his hand can still be traced in Verrocchio's 'Baptism of our Lord,' in the Academy at Florence. In 1472 his name appears in the books of the guild of painters as an independent artist, and he was patronised by Lorenzo de' Medici. His cartoon of 'The Fall,' mentioned by Vasari as designed for tapestry, has disappeared; indeed of his work of this period, which included various marble figures and terra-cotta heads, all that now remains is an unfinished canvas of 'The Adoration of the Kings,' in the Uffizi, and a kneeling figure of 'St Jerome,' in the Vatican.

He would appear to have been about twenty-eight when he visited the East, serving as engineer to the sultan of 'Babylon' or Cairo, and visiting Cyprus, Constantinople, and Armenia; and in 1482 he settled in Milan, and attached himself to Lodovico Sforza, then guardian of his nephew the Duke Gian Galeazzo, whom he afterwards supplanted. An autograph memorandum, intended for presentation to his patron, still exists, in which, after stating his various qualifications as an architect and engineer, he concludes, 'I can execute sculpture, whether in marble, bronze, or terra-cotta; also in painting I can do as much as any other, be he who he may,' and particularly specifies his readiness to undertake the execution of a bronze equestrian statue of Lodovico's father, Francesco Sforza, the celebrated condottiere. Drawings for the general design and various details of this statue exist in the royal collection at Windsor. The model was exhibited in 1493; but the statue was destined never to be completed in metal, for the 100,000 pounds of bronze which Leonardo required for its casting were never forthcoming. The model still existed in 1501, but since then all trace of the work has been lost.

During the progress of this statue Leonardo was also engaged upon a picture which, even in its present faded and dilapidated condition, remains the best monument of his genius and one of the masterpieces of the world. This is the famous 'Last Supper,' commissioned jointly by the Duke and the monks of Santa Maria delle Grazie, to be painted on a wall of the refectory of the convent. It was completed in 1498, but its execution probably extended over several previous years. Baudello, in one of his novels, has given us a vivid glimpse of Leonardo at work upon this great subject; of the hushed voices of the monks and their visitors as they watched the busy figure painting there from early dawn, wholly absorbed in his pursuit, and forgetting even to eat; and of how the artist would sometimes leave the mounted figure of Francesco which he was modelling in the citadel and return to the convent by the shortest way, merely that he might add to his picture a single touch or two. The moment of his chosen scene upon which the painter has seized is that when Christ has just pronounced the words 'One of you shall betray me,' and their effect upon the disciples is portrayed with the most delicate and subtle truth. There is an elaborate description and criticism of the work from the pen of Goethe. The after-history of the 'Last Supper' is a sad one. Owing to the dampness of the wall, and to the method of oil-painting—not fresco upon plaster that had been adopted, it soon showed signs of deterioration, and it has repeatedly been found necessary to repaint it; yet still, through all the retouching of others, the profound feeling and dignified composition of the master do not fail to assert themselves. His sketches for various of its parts still exist at Windsor, in the Brera Gallery at Milan, and in the Louvre. It has been very frequently copied, and it was chiefly from a drawing made by Matteini from the copy by Marco d'Oggionno that Raphael Morghen executed his celebrated line-engraving, published in 1800.

Among other paintings done in Milan were portraits of Lucrezia Crivelli and Cecilia Gallerani, mistresses of the duke, works that cannot now be identified, though 'La Belle Ferronnière' of the Louvre has been regarded by some as the former likeness. The influence of Leonardo upon art in Milan was clearly marked and lasting, for he founded an academy there in which Beltrallio and Andrea Salai, his favourite pupil, received instruction; and the great Bernardino Luini, whether or not he actually studied under the master, certainly imbibed and turned to his own uses many of the characteristics of his method. Leonardo was also much employed by his patron as an engineer. He devised a system of hydraulic irrigation of the plains of Lombardy, and acted as director of the court festivities and pageants.

After the fall and imprisonment of the Duke Lodovico in 1500 Leonardo retired to Florence, and by 1502 he had entered the service of Cesar Borgia, then Duke of Romagna, as architect and engineer, in which capacity he was entrusted with the most ample authority. Records of his work during this period appear in the note-books and maps preserved at Windsor. In the following year he returned to Florence, when he commenced a Madonna and Child with St Anne for the Servite monks, a subject, however, of which only the noble cartoon now in the Diploma Gallery of the Royal Academy, London, was completed.

We now reach the period of Leonardo's famous contest with Michael Angelo, an artist who appears always to have regarded his elder rival with dislike and jealousy. Both painters received commissions to decorate the Sala del Consiglio in the Palazzo della Signoria with important historical composi-

tions. Michael Angelo chose a subject of 'Soldiers surprised while Bathing,' an incident from the Florentine wars with the Pisans. Leonardo dealt with 'The Battle of Anghiari,' 1440, in which the Florentines vanquished the armies of Milan. Two years were spent in the preparation of his cartoon; but, having employed a method of painting upon the plaster—probably with wax—which proved a failure, he in 1506 abandoned the work. The cartoon is now lost, but its general composition may be gathered from Lucensi's engraving (1558), and from 'The Battle of the Standard,' engraved by Edelinck from a free copy by Rubens of its principal group. About 1504 was completed the most celebrated of Leonardo's easel-pictures, the half-length of Mona Lisa, third wife of Zanobi del Giocondo, upon which he had been engaged at intervals during four years—a work purchased by Francis I. for 4000 gold florins, and now one of the chief treasures of the Louvre. The colour here, as not seldom in the artist's work, has darkened with time, but still the picture remains a triumph of subtle and refined portraiture. Another work, now lost, portrayed the celebrated beauty Ginevra Benet; and Pacioli's *De divina Proportione*, published in 1509, contained sixty geometrical figures from Leonardo's hand. As had been the case in Milan, so here in Florence he powerfully influenced contemporary artists. Fra Bartolommeo, Jacopo da Pontorno, Ghirlandajo, and the sculptor Bandinelli all profited by his example.

The final period of Leonardo's life was spent in the service of France. In 1506 he visited Milan; and in the same year he was employed by Louis XII., who died in 1515, when Leonardo was in Rome, competing with Michael Angelo for the execution of the facade of San Lorenzo in Florence. The young French king, Francis I., bestowed on him, in 1516, a yearly allowance of seven hundred scudi, and assigned to his use the Château Cloux, near Amboise; and it was here that the great artist expired, 21 May 1519. The well-known story that he died in the royal arms is untrue. Among his later works is 'The Virgin of the Rocks,' now in the National Gallery, London, of which a varying version is preserved in the Louvre, where also is another of his works of the time, a figure of 'St John the Baptist,' and a 'Saint Anne,' somewhat similar in design to the Royal Academy cartoon.

In his art Leonardo was hardly at all influenced by the antique; his practice was founded upon the most patient and searching study of nature. He occupies a supreme place as an artist in virtue of his unrivalled power of delicate draughtsmanship, of his nobility of style and command over the subtleties of expression, of his skill in chiaroscuro and easy mastery of the complexities of light and shade, of modelling and relief, and of aerial perspective. So few in number are the authentic, completed, and well-preserved works by his hand that have reached us that he may be most fully studied in his drawings. Rich collections of these are preserved in the Ambrosian Library, Milan; the Louvre, Paris; the Royal Gallery, Florence; the Albertina Gallery, Vienna; the Academy, Venice; the British Museum; and the Royal Library, Windsor. His celebrated 'Trattato della Pittura,' dealing with all departments of the painter's art, was published in Italian in 1651, translated into French in the same year, and into English in 1721; but a more complete manuscript was discovered by Manzi in the Vatican, and by him published in 1817. His contemporaries bear witness to the splendid personal appearance of Leonardo; but the only undoubted portrait of him that survives is the noble bearded head in the Royal Library, Turin, a red chalk drawing by his own hand.

The voluminous manuscripts of Leonardo, written from right to left—for the painter was left-handed—and evincing his profound research in almost every branch of science, are preserved at Paris, Milan, Windsor, in the British Museum, in the South Kensington Museum, and at Holkham. See Richter's *Literary Works of Leonardo da Vinci* (1883), and his *Leonardo* (Lond. 1880); Mrs Heaton's *Leonardo da Vinci and his Works* (1874); the fac-simile reproduction of his manuscripts by Ravaisson-Mollien (Paris, 1881-90) and by the Italians (1894 *et seq.*); and books by Uzielli (1872-85), Scailles (1892), and Eugène Muntz (trans. 1898).

Leonforte, a walled Sicilian town, 49 miles by rail W. by N. of Catania. Pop. 15,645.

Leoni, LEONE (1509-90), goldsmith, medallist, and sculptor, worked at Milan, Genoa, Brussels, and Madrid, and was the rival of Benvenuto Cellini in talent, in vice, and in violence. See the monograph by Plon (Paris, 1886).

Leonidas I., son of Anaxandrides, king of Sparta, succeeded his half-brother, Cleomenes I., about 491 B.C. When the Persian monarch Xerxes approached with an immense army Leonidas opposed him at the narrow pass of Thermopylæ (480 B.C.) with a force of 300 Spartans, and rather more than 5000 auxiliaries. The Persians attempted in vain to win over Leonidas by the promise of making him ruler of the whole of Greece; and when Xerxes sent a herald calling the Greeks to lay down their arms, the Spartan answered: 'Let him come and take them.' The treachery of one Ephialtes having made it impossible to bar any longer the progress of the foe, Leonidas and his little band, having sent away the auxiliary force, threw themselves on the swarming myriads, and found a heroic death.

Leonine City. See ITALY, p. 247.

Leonine Verses, irregular forms of Latin verse which arose in the middle ages under the influence of the minstrels, who applied the accentual system of verse to Latin in defiance of quantity. They were used for epigrams, satires, and also for the hymns of the church, and were fairly naturalised in Europe by the end of the 11th century. The name specially applies to verses rhymed as well as accentual, and more especially to groups of alternate hexameter and pentameter verses, rhymed at the middle and end. They owe their name to Leoninus, a canon of the church of St Victor, in Paris, about the middle of the 12th century, or, as others say, to Pope Leo II., who was a lover and improver of music. The finest poem in this form is the famous *De Contemptu Mundi* of Bernard of Morlais. A familiar example is the couplet:

De domo linguabat, monachus tunc esse volebat,
Ast ubi convaleuit, mansit ut ante fuit.

Another is the famous epitaph of Bede in the Galilee Chapel of Durham Cathedral:

Hic sunt in fossi Bede venerabilis ossa.

Traces of this kind of versification appear here and there in the Roman poets, especially in Ovid, in some of whose Epistles, indeed, they are as common on an average as once in every eight lines. An example from Ovid is

Quot eodem stellis, tot habet tua Roma puellas.

Camden gives some curious specimens from Walter de Mares, Michael, the Cornish poet, and Dan Elingham, a monk of Linton. The story of the Jew who, having fallen into a refuse-pit on Saturday, would not be helped out, because it was *his* Sabbath, while the Christian, who offered him assistance, refused to do so *next* day, because it was *his*, runs thus in Leonine verse:

Tende manus, Salomon, ego te de stercore tollam;
Sabbata nostra ubi, de stercore surgere nolo;
Sabbata nostra quidem, Salomon, celebrabis ibidem.

We find the same metrical device employed in many English poems, as in Shelley's *Cloud*.

Leontius of Byzantium, a monk who wrote against various heresies in the 6th century. There is a monograph on him (in German) by Loofs (1887).

Leopard (*Felis pardus*), one of the larger Felidae (q.v.), now generally supposed to be identical with the panther. Great confusion has prevailed in the nomenclature: the *panther* and *pardalis* of the ancients are not certainly known; the jaguar was erroneously described as the panther by Bullion; the puma is often called panther in America; the leopard is known by the name of

Leopard (*Felis pardus*).

tiger in Africa; and, as Sir J. E. Tennent tells us, it is by mistake often called cheetah in Ceylon. The leopard is at home in Africa, from Algeria to Cape Colony; it is also found in Asia, from Palestine through central Asia to Manchuria. The ancients, distinguishing the leopard by non-existent attributes from the panther, gave it the name on the supposition that it was a hybrid between the lion (*leo*) and the pard or panther (*pardus*); as the giraffe or camelopard was thought to be a hybrid of the camel and the pard.

Supposing the leopard and panther to be one species, we may describe it as characterised by a peculiar gracefulness, slenderness and flexibility of form, with a very long tail, and spotted fur, the spots being arranged in numerous rows along the sides, and each spot composed of five or six small spots arranged in a circle or rosette. The general colour is yellowish; the lower parts lighter; the spots darker than the general colour of the fur. A black variety is known which is not a distinct species. The leopard is extremely agile, and possesses the power of leaping and also that of climbing trees in great perfection. It haunts wooded places, and is seldom to be found in open regions of long grass, like the tiger. Deer and antelopes are its habitual prey; but it is equally ready to feed on pigs, poultry, or whatever animals may be found in the vicinity of a farm or village. The size and strength of the leopard render it as dangerous to man as any of the Felidae; but it generally seems to dread and flee from man, unless assailed. It is very capable of domestication.

Leopardi, GIACOMO, the most distinguished poet of modern Italy, was born at Recanati, in the March of Ancona, 29th June 1798. Both his parents were noble; but both were poor. The conditions of Leopardi's early life were certainly un congenial, though his inherited temper disposed him to exaggerate everything distasteful to his own instincts. His father had the predilections of a scholar; but in religion and politics he was a reactionary, and in the management of his family unsympathetic and arbitrary. From the first there

was no real bond of sympathy between father and son, and the mother, though kindly and conscientious in the discharge of her duties, does not seem to have touched her son's heart. All through his boyhood Leopardi was an omnivorous reader; and his faculty of acquisition can be compared only to that of the younger Scaliger. By the age of sixteen he had read through all the Latin and Greek classics, and could write with accuracy French, Spanish, English, and Hebrew. That he also read with insight is proved by the fact that at sixteen he wrote a commentary on Plotinus, of which Sainte-Beuve could say that 'one who had studied Plotinus all his life could find something useful in this work of a boy.'

Leopardi was unhappy at home; and, conscious of his own extraordinary gifts, he eagerly desired to visit Rome, where he hoped to find the ideal world of the scholar and man of letters. From conscientious though petty scruples, his father long opposed this wish; but at length, in the strangely mistaken hope that Giacomo might at Rome be led to enter the church (for which he had been originally intended), he gave his permission (1822). A year's residence in Rome wrought in Leopardi a disillusion, which gave the final bent to his fundamental views of life. It was the time, it is to be remembered, when Italy was demoralised by the French domination; and in Rome itself the tone even of the best society was despicable. An acquaintance with Niebuhr and Bunsen, both of whom spoke of him as a prodigy, was almost the sole redeeming experience in the capital of Italy. It was with feelings of relief, therefore, that in 1823 he returned to Recanati. For the next ten years, partly of choice, but also largely of necessity, he devoted himself to literature. From his earliest days he had been of feeble and sickly constitution, and as he grew older his ill-health became more frequent and overmastering. As a confirmed invalid, he lived successively in Bologna, Florence, Milan, and Pisa, and finally quitted Recanati in 1830. In 1833 he accompanied his devoted friend Ranieri to his house in Naples, and there in constant bodily anguish and hopeless despondency he lived till 1837. He died on the 14th of June in that year.

Leopardi claims recognition at once as a scholar, a poet, and a thinker. Had his health permitted, and had he so chosen to devote his powers, there can be no question that he would have taken his place in the front rank of the students of antiquity. Immediately subsequent to his death the original productions of Leopardi were classed with the highest creative efforts the world has seen. His *Operette Morali*, consisting mainly of dialogues in which he expounds his peculiar philosophy, were compared for originality and power with the writings of Pascal, the writer whom he at least most closely resembles in tone of mind as well as in physical constitution. As a poet it was asserted that Dante alone of all the Italians was his equal in expressiveness of character and genius. Of late years, however, a more sober estimate has been formed of Leopardi's claims both as a poet and thinker. It is now generally recognised that his narrow range of sympathy and the essentially feeble spring of his nature debared him from the highest creative effort. The pessimism of which he is the recognised exponent in poetry, and which is equally the burden of his prose, was unquestionably the genuine expression of Leopardi's deepest nature as well as of his reasoned conviction. The note of pessimism has often been sounded by other poets besides Leopardi; but it remained for him to extract its full poetic context from a philosophy, the first and last word of which is the 'void and nothingness' of all human life and effort.

The works of Leopardi were edited in 1845 at Florence by Rameri in six volumes. The most noteworthy of his writings are, in poetry, his *Canto* and *Canzoni*, and a piece entitled 'Continuation of the Battle of the Frogs and Mice'; and, in prose, the Dialogues and Essays classed under the title *Operette Morali*. His Essays and Dialogues were translated into English by Charles Edwardes in 1882, his Poems by Frederick Townsend in 1888. See Gladstone's *Gleanings*, vol. ii.; Sainte-Beuve, *Portraits Contemporains*, tom. iii.; and Antona-Traversi, *Studi su Giacomo Leopardi* (Naples, 1888).

Leopold I., king of the Belgians, son of Francis, Duke of Saxe-Coburg, and uncle of Queen Victoria, was born at Coburg on 16th December 1790. After receiving an excellent literary and scientific education, he became a general in the Russian army, and was present at the battles of Lützen, Bautzen, and Leipzig. Whilst on a visit to England after the peace of 1815 he won the affections of the Princess Charlotte (q.v.), the heiress of the throne, married her, and was naturalised by act of parliament in 1816. The princess died in 1817; and Leopold twelve years later marriedmorganatically Caroline Bauer (q.v.). He received in February 1830 the offer of the crown of Greece, accepted it under conditions, but abdicated in May. In June 1831 he was elected king of the Belgians, and crowned at Brussels 21st July. As a monarch he conducted himself with great prudence, firmness, and moderation, with constant regard to the principles of the Belgian constitution. He died 10th December 1865, and was succeeded by his son, Leopold II. See BELGIUM, CONGO.

Lepanto (anc. *Naupactus*), now called by the Greeks Epakto, a small town of Greece, and the seat of a bishop, is situated on the north side of the entrance to the Gulf of Corinth. During the Peloponnesian war it was one of the chief naval stations of the Athenians. In the middle ages it was given by the Byzantine emperor to the Venetians, who fortified it so strongly that in 1477 it stood a siege of four months by 30,000 Turks, and in 1499 was only taken by Bajazet II. at the head of 150,000 men. Near Lepanto took place the celebrated naval battle between the Turks on the one side and the Papal galleys, and those of the Venetians and the Spaniards, on the other, on 7th October 1571, in which the Christians, commanded by Don John of Austria (q.v.), achieved a decisive victory. Of the Turks 30,000 fell or were taken prisoners, whilst 130 Turkish vessels were captured, and 12,000 Christian slaves liberated; the Christians lost 8000 men and 15 galleys. In this battle Cervantes lost an arm. The town became Greek in 1829.

L'Épée. See ÉPÉE.

Lepidodendron, a genus of fossil plants which occurs in Carboniferous and Upper Devonian strata. Several species are recognised, most of which attained a large size—40 or 50 feet long and more than 4 feet in diameter. They were tree-like lycopods, their living representatives being the low-growing club-mosses of our mountains. The stem tapered upwards and branched dichotomously, and was either covered with linear one-nerved leaves, or where these had fallen was marked with more or less prominent ovate or lozenge-shaped leaf scars, arranged in a spiral manner. The fruits, which were either terminal or lateral, were elongated, cylindrical bodies, composed of a conical axis, around which a great quantity of scales were compactly imbricated. The fossils described under the name *Kuorria* are now known to be the decorticated stems of *Lepidodendron*. So again the fruiting branches were formerly included under the genus

Halonia, while the cones were named *Lepidostrobus*. Some of the roots (*Stigmaria*) met with in the underclays of the coal-measures also appear to belong to *Lepidodendron*.

Lepidoptera (Gr. 'scaly-winged'), an order of Insects (q.v.). See also BUTTERFLY, CATERPILLAR, MOTH.

Lepidosiren (Gr. 'scaly siren'; *L. paradoxo*), one of the mud-fishes or Dipnoi, a native of Brazil, Paraguay, &c., but rather rare. It measures about 4 feet in length, and is probably carnivorous. Its general characters, along with those of the two other genera, *Ceratodus* (q.v.) and *Protopterus*, will be described under MUD-FISHES.

Lepidosteus. See BONY PIKE.

Lepidus, an illustrious Roman family of the ancient Æmilian gens. MARCUS ÆMILIUS LEPIDUS, when war broke out (49 B.C.) between Cæsar and Pompey, declared for Cæsar. During his own absence in Spain, Cæsar made Lepidus dictator of Rome and his colleague in the consulate (46 B.C.). He afterwards supported Antony, and became one of the trimvirate with Octavianus and Antony; but his weakness of character made him inferior to the other two, who assigned him Africa as his province (40-39 B.C.). Ultimately his legions deserted to Octavian, who allowed him to retain his wealth and the dignity of pontifex maximus. He died 13 B.C.

Le Play, FREDÉRIC (1806-82), engineer and economist, was professor in the School of Mines at Paris, and a senator. He was a commissioner at several exhibitions, and wrote *Les Ouvriers Européens* (1855), *La Reforme Sociale* (1864; 7th ed. 1887), *L'Organisation du Travail* (1870; 5th ed. 1888), on the family, on the English constitution, *La Constitution essentielle de l'Humanité* (1881), &c.

Leprosy. The terminology of this disease is somewhat confused; it was called by the ancients *elephantiasis* and *lepra*, but the latter term at least was also used of other forms of disease (of psoriasis, for example). In modern times, too, both these names have been applied to other diseases as well; *Elephantiasis Arabum* (q.v.) is distinct from leprosy, which is distinguished as *Elephantiasis Græcorum*, or *Lepra Arabum*. It is also sometimes called *Leontiasis*.

History and Distribution.—It is highly probable that what is now known as leprosy was one of the diseases, though certainly not the only one, spoken of by that name in the English Bible; Leviticus xiii. deals specially with the rules for the detection and isolation of cases of leprosy. It is not mentioned there prior to the sojourn of the Israelites in Egypt. It is worthy of note that it was regarded by the earlier Greek and Roman writers as an Egyptian disease. But it certainly existed in India and China at very early periods. Regarding its first appearance in Europe nothing is known. It has been supposed that it was brought from the East by the Crusaders; but there is evidence that it was prevalent long before the first crusade. During the middle ages it was extremely common; leprosy-houses, dedicated to St Lazarus (from whom lepers were called also lazars), existed throughout Europe, including the British Islands, for the reception of lepers, though in all likelihood not for them exclusively. Efforts were made to secure stringent isolation. The old Jewish leper with his rent garments and melancholy cry, 'Unclean! unclean!' was reproduced in the medieval leper, with a gray gown and a clapper to announce his approach. Since about the 14th century leprosy has been steadily declining in Europe. From Shetland where (as also in Cornwall) it lingered long, :

leper, of a leprous stock, was sent to Edinburgh Infirmary in 1798, and a few cases occurred in the beginning of the 19th century. Liberton, near Edinburgh, is believed to take its name from the leper-house established there.

At the present day the only part of Europe where it is common is Norway; but it also occurs in Iceland, on the Russian coasts of the Baltic and Gulf of Finland, in south Russia, in Portugal, Spain, Italy, Turkey, Greece, and many of the Mediterranean islands. Everywhere in Europe, however, it is found only in limited districts. In Africa it is met with almost all round the coast and in the adjacent islands. In Asia it occurs in all the countries and most of the islands on the south, from Arabia and Persia to China and Japan. In America it occurs in New Brunswick, in Central America, the West Indies, and the northern and eastern parts of South America. In the United States and in Australia cases have occurred, but almost all among the Chinese immigrants; in New Zealand it is much more common among the natives. In the Sandwich Islands it seems to have first appeared about 1850, but has spread with alarming rapidity; it is also met with in some others of the Pacific islands (for the leper island of Molokai and its institution, see HAWAII). The exclusion of lepers is in most places carefully aimed at. Larger or smaller leper-hospitals are found in all countries where lepers are numerous; notable ones being at Bergen, Tracadie (in New Brunswick; administered by devoted religious sisters), Robben Island (near Cape Town); there are upwards of a dozen in India.

Course and Mode of Spreading.—The above list of localities is enough to show that the disease is not dependent upon climate. There has been a general belief from time immemorial in countries where it occurs that it is contagious; but, though numerous cases are met with of persons temporarily residing in districts where the disease is prevalent who have become affected by it, instances are extremely rare in which they have communicated the disease to others in countries where it is not endemic; and if it is contagious, it must be under very rare and exceptional conditions. Almost all qualified observers, however, believe that the disease, or a constitutional tendency to it, is strongly hereditary. Evidence has recently been adduced which seems to show that it may be communicated by vaccination from a leprous child. Insanitary conditions, filthy habits, and unwholesome food are generally believed to favour its occurrence; though persons in comfortable circumstances are by no means exempt. Some authorities, among whom Mr Jonathan Hutchinson is prominent, think that 'in some way fish-food, and especially when either salted or decomposed,' is the main cause of its origin. In 1874 Hansen of Bergen found a bacillus, extremely like the bacillus of tubercle, afterwards discovered, in the affected tissues; and his observations have been confirmed by many other observers, so that there is no doubt that this organism is a constant feature of the disease.

Symptoms and Course.—The disease is usually very slow and insidious in its appearance and progress. The earliest symptoms are debility, depression, loss of appetite, and general constitutional disturbance. Two forms of the disease are recognised, *tubercular* and *anæsthetic* leprosy, according to the tissues first and chiefly involved. In the tubercular form the earliest recognisable change consists in the appearance of reddish-brown spots on the skin, usually of the limbs, tender to the touch, and somewhat swollen. They may disappear, leaving the skin only slightly thickened; but repeated attacks occur and affect wider areas; ultimately the skin of the face becomes thickened,

puckered, and nodulated, giving a peculiar, heavy, morose expression; the hands and feet become similarly affected; some of the nodulated spots form into deep intractable ulcers; owing to changes in the cornea the sight is dimmed or lost; the mucous membrane of the mouth and throat becomes thickened, and the voice reduced to a hoarse whisper. In the anæsthetic form certain of the nerves are chiefly affected, and before any visible changes occur sensation is lost in the areas of skin supplied by them. Mutilation of the fingers and toes often occurs, the bones being destroyed, or the whole parts dropping off, often without pain. This form is generally slower in its progress than the tubercular form, but frequently leads to the development of the latter. In whatever way the disease begins, the constitution is slowly enfeebled, and the sufferer falls a ready victim to some intercurrent malady; for leprosy is seldom itself the direct cause of death.

Treatment.—The disease may under favourable conditions remain quiescent for long periods. In the Tracadie lazaretto there have been patients who have suffered from leprosy for fifty years. Cases have even been reported of complete recovery. Improvement has sometimes followed the use of Gajjun (q.v.) and Chaulmoogra oils. But in the vast majority of cases no treatment has proved of any use in arresting the progress of the disease.

See a monograph on True Leprosy by Liveing (1873); and the works on Skin Diseases by Wilson, Hutchinson, and others. For mediæval leprosy, see Sir J. Y. Simpson in *Edin. Med. and Surg. Jour.* (1846-47); for leprosy in India (where in 1888 there were 135,000 lepers, or, according to other estimates, 250,000), see Vandyke Carter's work (1873); for leprosy on Robben Island, see *Blackwood's Magazine* for 1889.

Lepsius, KARL RICHARD, Egyptologist, was born at Naumburg, 23d December 1810. His father, Karl Peter Lepsius (1775-1853), a magistrate there, was himself a zealous antiquary, and published learned treatises on the local antiquities. The younger Lepsius studied at Leipzig, Göttingen, Berlin, and Paris. His first work was *Die Palæographie als Mittel der Sprachforschung* (1834), for which he obtained the Volney prize of the French Institute. This was followed by works on the most ancient alphabets and other kindred subjects. In 1836 he associated himself intimately with Bunsen at Rome, and eagerly prosecuted his favourite studies there. Between 1834 and 1842 he published his *Lettre à M. Rosellini sur l'Alphabet hiéroglyphique*, and, in the *Transactions* of the Archaeological Institute, a number of dissertations on the monuments of Egyptian art and their general architectural style. He also applied himself to the study of the ancient Etruscan and Oscan languages, the remains of which he published in his *Inscriptions Umbricæ et Oscæ* (1841) and other works. In 1842 he was placed at the head of an antiquarian expedition sent to Egypt by the King of Prussia, and on his return three years later was appointed ordinary professor in Berlin. His *Denkmäler aus Aegypten und Aethiopien* (12 vols. folio, with 963 plates, 1849-60) was published at the expense of the King of Prussia, and remains a masterpiece of patient genius and erudition. His *Chronologie der Aegypter* and *Ueber den ersten Aegypt. Gotterkreis* laid the foundation for a scientific treatment of the earlier parts of Egyptian history. To the study of Egyptian archaeology he joined the investigation of the languages, history, and monuments of the regions farther up the Nile. Other works are his letters from Egypt, Ethiopia, and Sinai (1852); a communication on the Egyptian monuments (1853); the work in which he expounds the *Standard Alphabet*, a modified Roman alphabet for hitherto unwritten languages, now used in many cases

(1855; in its second edition, published in English in 1863, adapted to 120 languages); a work on the Egyptian ell and other measures; the *Königsbuch*, a list of kings (1858); the *Todtenbuch* (1867), the Egyptian Book of the Dead (q.v.). He wrote also on Chinese, Arabic, and Assyrian philology; was editor of the Berlin *Zeitschrift* of Egyptology, member of the Royal Academy, director of the Egyptian section of the Royal Museum, and chief-librarian of the Royal Library at Berlin. He was a creator of Egyptology as a scientific study, and a devoted and single-minded scholar of the best type. He died 10th July 1884. See Ebers, *Richard Lepsius, ein Lebensbild* (1885; Eng. trans. New York, 1887).

Leptospermum, a genus of trees and shrubs, natives of Australia, New Zealand, &c., of the natural order Myrtaceae, sub-order Leptospermeae. They are evergreen, with leaves somewhat resembling those of myrtles. Some bear the name of Tea-tree, as *L. lenigerum*, *L. barbatum*, *L. fluosum*, and *L. grandiflorum*, because the leaves have been used as a substitute for tea. *L. scoparium* is sometimes called the *New Zealand Tea-plant*, sometimes the *Brown tree* or *Doopwood-tree*. It is common both in New Zealand and Australia.

Lerida, a town of Spain, capital of the province of Lerida (area, 4762 sq. m.; pop. 285,417 in 1887, having decreased from 314,530 in 1860), on a tributary of the Ebro, 114 miles by rail W. by N. of Barcelona. The second city of Catalonia, Lerida has a castle and two cathedral churches, one an ancient Byzantine-Moorish edifice, now used as a barracks, the other a modern Græco-Roman building. It carries on manufactures of woollens, cottons, leather, paper, and glass. Pop. (1877) 203,369; (1884) 17,672. Near Lerida, the Celtiberian *Herda*, Scipio Africanus defeated Hanno (216 B.C.) and Cesar, the lieutenants of Pompey (49 B.C.). The Goths made it a bishop's see and held here a council of the church in the 6th century. In 1300 a university was founded here; it is now extinct. The town has been several times besieged, on the last occasion by the French in 1810.

Lérins, a small group of French islands in the Mediterranean, 2½ miles SE. of Cannes. On Sainte-Marguerite (the ancient *Lerina*), 4 miles in circumference, stands a fortress in which the Man with the Iron Mask and Marshal Bazaine were at different times confined, and from which Bazaine escaped in 1874. On Saint-Honorat (anciently *Lerina*), 2 miles in circuit, are the ruins of the once famous monastic school. Vincent Lérinensis, a monk here (died 450), was the author of the famous definition of Catholicism (see CATHOLIC CHURCH).

Lermontoff, MIKHAIL YUREVITCH, one of Russia's greatest poets, called the 'poet of the Caucasus,' was born, of Scotch extraction (Learmont; probably traceable back to Thomas the Rhymer), in Moscow on 15th October 1814. He was educated at Moscow and in the school of pages at St Petersburg, and, entering the army, was sent on active service in the Caucasus. There he was shot dead in a duel on 15th July 1841. The death of Pushkin gave him his first poetic inspiration, which took shape in an impassioned appeal for vengeance on Pushkin's slayer. But it was the sublime scenery of the Caucasus that inspired his best poetic pieces, such as *The Novgorod*, *The Demon*, *Ismaïl Beg*, *Valerik*, &c. One poem from his pen, *The Song of the Captive Anna Vasilievitch*, is highly praised as a successful attempt to reproduce the spirit of the Little Russian popular poetry. A Byronic note runs through most of Lermontoff's poetic work. In 1839 he published a good novel, *A Hero of Our Time*; this is said to have occasioned the duel that cost him his life. See Turner, *Studies in Russian Literature* (1883);

Blackwood's Magazine (1884); and George Brandes, *Impressions of Russia* (1890).

Lernaïda, a family of Copepod crustaceans, of which the females are parasitic on fishes and grotesquely degenerate, the adults showing hardly a trace of crustacean structure. See FISH-LOUSE.

Leroy de St Arnaud. See ST ARNAUD.

Lerwick, (the county town of Shetland, on the east coast of Mainland and on Bressay Sound, 116 miles NE. of Kirkwall. Demolished and refounded in the 17th century, it has been greatly improved since 1850, and has a town-hall (1883), county buildings (1872), water and drainage works (1871); whilst, to meet the rapid growth of its shipping and fisheries, extensive harbour-works (pier, wharves, &c.) were carried out during 1883-86. Pop. (1831) 2750; (1881) 4045; (1891) 3930.

Le Sage, ALAIN-RENE, was born in 1668 at Sarzeau in Brittany. His father died in 1682, leaving him to the care of an uncle, who so mismanaged his affairs that he began life with little more capital than genius and an education received at the Jesuit school at Vannes. In 1692 he went to Paris to study law, but an early marriage drove him to seek a less tardy livelihood in literature. His first work was a translation of the letters of Aristænetus in 1695, and about the same time he made the friendship of the Abbé de Lionne, who was owner of a good Spanish library collected by his father the ambassador, of which he made Le Sage free, with a pension of 600 livres to enable him to profit by it. The first fruit was the project of a *Théâtre Espagnol*; but all that came of it was one volume in 1700 containing two plays, the *Traître puni* and *Don Felix de Mendore*, imitated from Rojas and Lope de Vega. In 1702 *Le point d'honneur*, from *No hay amigo para amigo* of Rojas, failed on the stage. His next venture (1704) was a rifacimento of Avellaneda's *Don Quixote*. The year 1707 was the turning-point in his fortunes. *Don Cesar Ursin*, from Calderon's *Peer esta que estaba*, was played with success at court, and *Crispin rival de son maître* in the city; and more successful than either was the *Diable Boiteux*, the framework, title, and first chapter of which he took from the *Diablo Cojuelo* of Guevara. In 1708 he offered the Théâtre Français two plays; *La Tontine* was accepted, but shelved, and not produced until 1732; *Les Etrangers* was rejected, as rules did not allow one-act pieces before Easter. Le Sage took it back, and altered and expanded it into *Turcaret*; but the financiers it satirised, after an attempt to buy him off with 100,000 livres, organised such an opposition against it that it was saved only by an order from the Dauphin. Le Sage was not a man to submit to caprice. It is told of him that when the Duchesse de Bouillon, at whose house he was to have read *Turcaret*, received him with a haughty reprimand for keeping her waiting, he replied, 'Very well, madame, if I have made you lose an hour I will make you gain two,' and with a bow walked out; and it was no doubt the same spirit of independence that made him go over in 1709 from the Théâtre Français to the opposition Théâtre de la Foire. Unless the *Amants Jaloux* of 1736 be his, he made no attempt after this to return to the regular drama, but continued to supply the Foire stage with slight pieces of the kind it was restricted to, which he published from time to time in the volumes composing the *Théâtre de la Foire*. For these the Persian tales which he helped his friend Pétis de la Croix to put into shape in the *Mille et un Jours* were of great service to him. But the success of the *Diable Boiteux* was too encouraging to allow him to neglect the Spanish. In 1715 *Gil Blas* (vols. I. and II.) came out, followed in 1717-21 by an attempt at an Orlando. In 1724

came the third and, as it seemed, last vol. of *Gil Blas*, and in 1726 a new edition of the *Diable Boiteux*, doubled in bulk by additions of his own and from Santos. In 1732 he gave his *Guzman de Alfarache*, 'purged of superfluous moralities,' and *Robert Chevalier de Beauchêne*, the life of a buccaneer whose widow, he says, furnished the memoirs. In 1734 he took the title of *Estebanillo Gonzalez*, but very little else, from the original Spanish. In 1735 the fourth vol. of *Gil Blas* appeared, and also the *Journée des Parques*; in 1736-38 the *Bachelier de Salamance*, the 'remainder biscuit' of *Gil Blas*; in 1739 his plays, in two vols.; in 1740 *La Valise trouvée*, a volume of letters; and in 1743 the *Mélange Amusant*, a collection of facetiae from his memory or his notebook. That year brought his first sorrow, the death of his eldest son René, otherwise Montménil the comedian. Le Sage had a contempt for actors and their calling, and when his son adopted it he disowned him. But in time, brought round to see him in *Tararac*, he was conquered by his own creation alive in the genius of his son, and the estrangement ended in their being drawn together more closely than ever. The death of his son and his own increasing infirmities, particularly his deafness, made him abandon Paris and literary life, and retreat with his wife and daughter to Boulogne, where his second son, Julien, held a canonry in the cathedral; and there, in the Rue du Château, he died in 1747, in his eightieth year. Of himself, personally, there is very little on record. He was withdrawn from society by his deafness, from which he was a sufferer as early as 1709, and lived a quiet, retired, industrious life, surrounded by his family; and perhaps their devotion and the loving care with which they tended him in his last days are more eloquent than any eulogy of his character and virtues that preacher could pronounce.

Le Sage's reputation as a dramatist and as a novelist rests in each case on one work. The author of *Tararac* might, under favouring circumstances, have done anything in comedy short of dethroning Molière, but as it is he has no claim to a place in the first order of dramatists. But whatever severe critics may say, the author of *Gil Blas* stands in the front rank of the novelists by the common consent of the great mass of readers of all nations. On the other hand there are some who deny originality to one who borrowed ideas, incidents, and tales from others—Espinel, Rojas, Mendoza, Quevedo—as Le Sage did; and some who go still further, and deny that the author of *Gil Blas* was anything more than a translator. The question of what constitutes originality would be out of place here, but the other is simply a question of evidence which may be briefly summed up. It was primarily Voltaire who raised the issue. Le Sage had put him into *Gil Blas* as Don Gabriel Triaquero, and he in return said in his *Sacré de Louis XIV.* that *Gil Blas* was 'entirely taken from *La Vida de lo Escondido Don Marcos d'Obregón*,' showing that he had never seen the book he quoted, and could not read it if he had. Backed by his name, the fignment had a wide circulation, especially in Spain, and the Padre Isla was set on to develop it, which he did in his own peculiar fashion (see *ISLA*). The Comte de Neufchâteau having taken up *Isla* seriously, was replied to by Llorente, who maintained that though *Isla* was in just he had truth on his side. His own theory was that in the Lionne library Le Sage found a MS. novel, called the *Bachelor of Salamance*, written, probably by Solís the historian, in 1655, and that out of this he carved *Gil Blas*, serving up the remainder afterwards under the original title. The argument, in brief, is that

Gil Blas is crowded with details of a kind that Le Sage, who never was in Spain, could have had no knowledge of, and could not have got from books. Of these details, however, a good many need not have had any more recondite source than *Don Quixote*; and for the rest Le Sage would have said that he only wondered at his own moderation, for he could have taken ten times as many from the plays and picaresque novels in the abbé's library, and from books of travellers like Aarssen van Sommelsdyck, Bertaut, and Mme D'Aulnoy. But Llorente points out that over a hundred places, often obscure hamlets that few Spaniards even ever heard of, are named, in general correctly, which is a proof of some exceptional source of information; but sometimes incorrectly, a proof that the source was a MS. not a printed one. But a plain tale will put him down; the names are in old French maps. Of a score picked out as manifest mis-readings from a MS.—Grajal, Rodillas, Luceno, Castil Blazo, &c., all but one are in the map of Spain printed in Paris by Jaillot *circa* 1695, and all the notable ones in that of 1713, just two years before *Gil Blas* appeared. From maps, too, come Le Sage's blunders in topography—e.g. putting Peñador on the road to Salamancea, Alcalá between Madrid and Segovia, Peñafiel between Segovia and Valladolid, Liria 'sur les bords du Guadalaviar.' Finally he urges Le Sage's familiarity with secret history and the private affairs of Olivares, his daughter's marriage (xi. 9), and his adoption of Margarita Spinola's son (xii. 4); and asks how could he have known matters and names not to be found in print, save from a contemporary MS.; which, as before, his mis-readings, Niebles for Niebla, Abiados for Abiados, Valeasar for Valareal, bear witness to? But again the answer is simple. He found 'Niebles' and 'Abiados,' as well as the marriage story in the translated *Anecdotes du ministère d'Olivares* (Paris, 1722), and put the very words of the book into the mouth of Olivares, whose portrait (xi. 2) is word for word from the *Anecdotes*. 'Valeasar' he found in the *Relation de ce qui s'est passé à la disgrâce d'Olivares* (Paris, 1650), from which he took the Count Duke's curious 'confidence' to *Gil Blas*, and, also, sundry names cited by Llorente. One by one, in short, the supports give way, and the MS. theory falls to the ground. Nevertheless, in the absence of rebutting evidence, its plausibility imposed upon some good critics, the author of 'Who Wrote *Gil Blas*?' in *Blackwood* (1844), A. H. Everett, and Ford, among others. All admit, however, that the translator has left the stamp of his nationality indelibly impressed upon the work; the mystery lies in its wealth of detail. Llorente puts the matter in a nutshell when he asks why did Le Sage, if he was the original author, give himself so much needless trouble? Why so particular to name 'Torvalva,' when it would have done just as well to say 'a village near Cuenca?' The answer is that Le Sage was before all things an artist, and knew the value of details in producing the verisimilitude he aimed at. In this respect and many others he was like his great contemporary Defoe. He spared no pains to make his conception a reality to his reader. When he sent *Gil Blas* on a journey he was not content to generalise his road, but looked up the villages he had to pass through on the best map he could find. When he brought him to an inn, he went to the novels and plays for inn furniture and company and conversation. This is the rationale of his borrowings, and it is this, as much as his delightful style, that makes him the prince of raconteurs. He was the first to perceive the capabilities of the picaresque novel, and with the

culinary genius of his nation (by no means confined to artists like him who could make a savoury ragout out of an old boot) he got rid of its crudities, brought out its flavour, and served it up with a *sauce piquante* of his own. In so doing he advanced the novel of real life an important stage, and, to his honour be it said, no abuse of realism can be laid to his charge. In the words of Scott, 'His muse moved with an unpolluted step, even where the path was somewhat miry.'

Lesbos, or MYTILENE, a Turkish island in the Ægean Sea, lies 10 miles from the coast of Asia Minor, north of the Gulf of Smyrna. It is triangular in shape, with two deep inlets on the south-east and south-west, and is for the most part mountainous, reaching 3079 feet in Hagios Elias (Olympus). The soil is fertile and yields good crops of olives, the oil being the chief export. In ancient times wine was a speciality. The climate is delightful. The chief drawback of the island is the earthquakes, which occur pretty frequently. Area, 676 sq. m.; pop. 36,000, mostly Greeks. The ancient capital was Mitylene (on coins Mytilene); the existing town, called Castro, 'a straggling dirty village,' has a population of about 12,000. It stands on a peninsula on the east coast, is defended by a medieval castle, and has a shallow harbour. Other ancient cities were Methymna, Pyrrha, Antissa, and Eresus. The modern town of Agiasso has 7000 to 8000 inhabitants. The island was early colonised by Æolian immigrants. Between 700 and 500 B.C. it was the flourishing home of poets and literary men, as the names of Alceus, Sappho, Terpander, Pittacus, Theophrastus, Theophanes, and others will attest. The Lesbians made themselves masters of considerable territory on the opposite mainland of Asia Minor. But in the 6th century B.C. it was for about sixty years subject to Persia. In 476 it joined the Athenian league, but, revolting in 429, was promptly reduced to obedience again. Then it belonged successively to Macedonia, Pontus, Rome, and Byzantium. From 1355 to 1462 it was owned by a Genoese merchant family, who lost it to Sultan Mohammed II. Of its shores the Turks were defeated by the Venetians in 1690 and 1698, and by the Greeks in 1821. The island has been called Mytilene from the middle ages down to the present time.

Leslie, a town of Fife, 12 miles SW. of Cupar, and 3 W. of Markinch by a branch-line (1861). It has flax-spinning, bleaching, and paper works. Pop. 3421.

Leslie, Lesly, or LESLEY, THE FAMILY OF, is first found between 1171 and 1199, when Malcolm, son of Bartholf, obtained Lesslyn or Leslie, a wild pastoral parish in Aberdeenshire. His descendants took their surname from their lands.

Earls and Duke of Rothes.—The family was embled in 1457, when George Leslie of Rothes was made Earl of Rothes and Lord Leslie. The fourth earl was father of Norman Leslie, Master of Rothes, the chief actor in the murder of Cardinal Beaton. John, the sixth earl, who died in 1641, distinguished himself as one of the ablest of the Covenanting leaders. His son became Lord Chancellor of Scotland in 1667, and in 1680 was created Duke of Rothes, Marquis of Ballinbreich, Earl of Leslie, &c. These honours became extinct upon his death without male issue in 1681. The earldom

of Rothes went to his elder daughter, in whose family the title has continued.

Earls of Leven.—Before the family left Aberdeenshire it had thrown off branches, some of which still flourish there. The chief, that of Balquhain, gave birth to several men of mark, such as the learned John Leslie, Bishop of Ross (1527-96), the devoted champion of Mary Queen of Scots; Sir Alexander Leslie of Auchintoul, a general in the Muscovite service, who died governor of Smolensko in 1663; and Charles Leslie (q.v.). A still more distinguished man was Alexander Leslie, who rose to be a field-marshal of Sweden under Gustavus Adolphus. Recalled to Scotland in 1639, he took command of the Covenanting army, and in 1641 was made Earl of Leven and Lord Balgony. He died in 1661, and his honours and lands eventually passed to his great-grandson, David Melville, third Earl of Leven and second Earl of Melville. His descendant succeeded as eleventh Earl of Leven and tenth Earl of Melville in 1889.

Lords Lindores.—The second son of the fifth Earl of Rothes was created Lord Lindores in 1600. The title has been dormant since the death of the seventh lord in 1775.

Lords Newark.—David Leslie, fifth son of the first Lord Lindores, served with distinction under Gustavus Adolphus, and, returning to Scotland in 1640, acted as lieutenant-general to the Earl of Leven. He was present at Marston Moor, and surprised and routed Montrose at Philiphaugh. Taken prisoner by Cromwell at Worcester in 1651, he suffered imprisonment in the Tower till the Restoration. He was made Lord Newark in 1661, and died in 1682. The title has been dormant since the death of his great-grandson, the fourth lord, in 1791.

Counts Leslie.—Walter Leslie, a younger son of the House of Balquhain, distinguished himself in the Austrian army, and in 1637 was created a count of the empire, as a reward for his services in the murder of Wallenstein. He died without issue in 1667, when he was succeeded by his nephew, James, a field-marshal in the Austrian service, who died in 1694. The title became extinct in 1844.

Leslie, CHARLES, nonjuring divine, was born at Dublin on the 17th July 1650, studied at Trinity College, Dublin, and, having taken orders in 1680, became chancellor of the cathedral of Connor in 1687. Deprived at the Revolution for declining the oath of allegiance, he retired to England and wrote against Papists, Deists, Socinians, Jews, and Quakers, as well as in support of the nonjuring interests. He went with the Pretender to Italy after 1715, but returned to Ireland in 1721, and died 13th April 1722. His *Short and Easy Method with the Jews* appeared in 1684; his *Short and Easy Method with the Deists* in 1694; he issued a collected edition of his *Theological Works* in two folio volumes in 1721 (new ed. 7 vols. 1832). See a Life by R. J. Leslie (1885).

Leslie, CHARLES ROBERT, genre-painter, was born in London on 19th October 1791, his parents being Americans. He was educated at Philadelphia, to which city his parents took him in 1809. In 1811 he returned to England, and entered as a student in the Royal Academy, West, Fuseli, and Allston exercising the earliest influence over him. The first picture that brought him into notice was 'Sir Roger de Coverley going to Church' (1819). In 1821 'May-day in the Reign of Queen Elizabeth' secured his election as an Associate of the Academy; and 'Sancho Panza and the Duchess,' exhibited in 1824, obtained for him the rank of Academician. Leslie's principal pictures are scenes from the works of Shakespeare,

Cervantes, Le Sage, Moliere, Addison, Swift, Sterne, Fielding, and Smollett. Great power of expression, and a delicate perception of character and of female beauty, are his strongest points. In 1833 he accepted the appointment of professor of Drawing at the military academy of West Point, New York; but gave up the post early in the following year, and returned to England. From 1848 to 1852 he was professor of Painting at the Royal Academy. He died in London on 5th May 1859. His lectures were published in 1855 in the useful *Handbook for Young Painters*; he also wrote an able *Life of Constable* (1843), and began the *Life and Times of Sir Joshua Reynolds*, completed by Tom Taylor. The *Autobiographical Recollections* of Leslie were edited by Tom Taylor (1869).—His son, GEORGE DUNLOP LESLIE, born in London in 1835, whose aim has been 'to paint pictures from the sunny side of English domestic life,' was elected A.R.A. in 1868 and R.A. in 1876. See his *Letters to Marco* (1893) and *River-side Letters* (1896).

Leslie, FRANK, publisher, was born at Ipswich in 1821, his proper name being Henry Carter, and at seventeen was placed in a mercantile house in London. 'Frank Leslie' was the name he adopted in sending in sketches to the *Illustrated London News*, and the success of these determined him to join the staff of that paper. In 1848 he proceeded to the United States, where he assumed the name of Frank Leslie by a legal process, and in 1854 founded the *Gazette of Fashion* and the *New York Journal*. *Frank Leslie's Illustrated Newspaper* was commenced in 1855 (German and Spanish editions later), the *Chimney Corner* in 1865; and afterwards the *Boys' and Girls' Weekly*, the *Lady's Journal*, and a number of other periodicals were published by him. He died 10th January 1880; his widow then assumed his name and carried on his business.

Leslie, SIR JOHN, a celebrated natural philosopher, was born at Largo, Fife, 16th April 1766. He studied at St Andrews and Edinburgh universities, and in 1788 became tutor to two young Americans, with whom he proceeded to Virginia and other parts of America, returning to London in 1790. During the next fifteen years he was variously employed in scientific writing or travelling on the continent with pupils, but all the while engaged in experimental research. The fruits of his labours during this period of his career were a translation of Buffon's *Natural History of Birds* (1793), the invention of a differential thermometer, a hygrometer, and a photometer, and the publication of his important *Experimental Inquiry into the Nature and Propagation of Heat* (1804). For this latter work the Royal Society awarded Leslie the Rumford medal for scientific research. In 1805 he obtained the chair of Mathematics at Edinburgh, in spite of a good deal of opposition from the clergy, who objected to his approval of Hume's theory of causation. He occupied it for fourteen years, but most of his leisure time was occupied in scientific experiments. In 1810 he invented the process of artificial refrigeration, which has since been put to so many practical uses. In 1819 he was transferred to the chair of Natural Philosophy, where his peculiar talents found their proper sphere. During the next few years he wrote numerous articles and published several works on natural philosophy and mathematics; but his chief claim to the gratitude of the scientific world lies in his useful inventions, such as the pyroscope, atmometer, athriroscope, and the prominence which he gave to experimental illustration in his university lectures. In 1832 he was created a Knight of the Guelphic Order; on 2d November of the same year he died, at his

estate of Coates, in Fife, near his birthplace. See *Memoir* by Macvey Napier (1838).

Leslie, THOMAS EDWARD CLIFFE, political economist, was born in County Down, Ireland, in 1827, and educated at Trinity College, Dublin. He qualified for the bar, but in 1853 was appointed to the chair of Economics and Jurisprudence at Belfast. In that city he died on 27th January 1882. His writings, mostly fragmentary in character, were collected in two books entitled *The Land Systems* (1870), containing studies on the land question in Ireland, Belgium, and France, and *Essays in Political and Moral Philosophy* (1879), which treat principally of the gold question and economic method. Leslie was a strenuous advocate for the study of economic problems in the light of the historic method, instead of the purely analytic method of Ricardo. He introduced the works of continental economists, such as Roscher and Laveleye, to the notice of English students.

Lespinasse, CLAIRE FRANCOISE, OF JULIE JEANNE ELEONORE, was born 9th Nov. 1732, at Lyons, an illegitimate daughter of the Countess d'Albon. At first a teacher, she became in 1754 a companion to Madame du Deffand, whose friends, especially D'Alembert, she quickly attached to herself. After the inevitable rupture that followed, she was enabled by the bounty of her friends to maintain a modest salon of her own. The charm she exercised was in no wise due to beauty, for she was plain in face, and, moreover, disfigured by smallpox; yet conversation was brighter and more harmonious, and wit more brilliant in her circle than anywhere else in Paris. Unfortunately for her peace she had a heart sensitive to love, and the passion she was capable of at forty for the young Spaniard, the Marquis de Mora, and two years later for M. de Guilbert, cost her the deepest pangs, when the first died and the second was separated by marriage. The famous D'Alembert had long admired and loved her, but her affection for the philosopher never cost her tears. She died at Paris, 23d May 1776. Many of her letters to her two lovers have been published, and these are aglow with fire and passion. Indeed, in their first editor's metaphor, her phrases burn the paper on which they are written.

The famous *Letters* were published in two volumes in 1809. Later editions are by J. Janin (1847) and Sambert (1877). M. Charles Henry's *Letters inédites* (1887) were mostly addressed to Condorcet. The editor's introduction is much too high-pitched. A juster judgment will be found in vol. ii. of Sainte-Beuve's *Causeries de Launois*.

Lesseps, FERDINAND, VICOMTE DE, engineer, was born at Versailles, November 19, 1805. Educated for the diplomatic profession, he filled successive appointments at Lisbon, Cairo, Barcelona, and Madrid. In 1854 he conceived his great scheme for cutting the Suez Canal, and in January 1856 he received a letter of concession from the Viceroy of Egypt. Robert Stephenson and other English engineers questioned the practicability of the scheme, but De Lesseps overcame all obstacles. A company was formed, and the works were begun in 1860. The great undertaking was completed (see CANAL, and SUEZ) in August 1869, the canal being formally opened on 17th November following. The successful engineer was created K.C.S.I. by Queen Victoria, and received the honorary freedom of the city of London in 1870. The Paris Societe de Géographie awarded him 10,000 francs; he was appointed a Grand Cross of the Legion of Honour; and after the publication of his *History of the Canal* he was awarded 5000 francs by the French Academy. In 1873 the Paris Academy of Sciences elected him a free member, and in 1881 he was elected president of the French Geographical Society. In 1883 he sought to conclude an

arrangement with the British government for a second Suez Canal. Meanwhile, work had begun on his stupendous scheme for a Panama Canal (see CANAL, and PANAMA), a scheme destined to issue in disaster and disgrace. For in 1892-93 the management was charged with breach of trust, and five directors were condemned—Lesseps, now a broken old man, to five years' imprisonment and a fine, as was also his son Charles. The sentence was ultimately quashed; but he fell into dotage, and died 7th December 1894. He wrote *Documents pour servir à l'histoire du Canal de Suez* (4 vols. 1875-79; trans. 1876), and *Souvenirs de Quarante Ans* (1887; trans. 1887). See books by Ferrier (1887), G. B. Smith (2d. ed. 1895), Bridier (1899).

Lessing, GOTTHOLD EPHRAIM, reformer of German literature, was born, the son of the pastor of Kamenz, in Saxony, on 22d January 1729. From the school of St Afra, at Meissen, where he had spent five years, he entered in 1746 as a theological student at Leipzig. But, instead of studying theology, he made haste to acquire a knowledge of men and of the world, to polish his manners, to learn bodily and social accomplishments, and to improve his taste, and developed that strong, manly independence which was always one of the most striking traits in his character. Moreover, he cultivated a love for the stage, and began to write plays, mostly comedies, in the French style. All this sorely grieved his strictly orthodox parents. And yet, both at Meissen and at Leipzig, Lessing manifested an ardent thirst for knowledge and truth; he had great intellectual parts, and read hard. But his mode of life at the university ran him into debt—a state that was more or less chronic to him throughout his life; then in 1748 the theatre was closed; and he suffered from an innate restlessness that never let him abide long in one place. Accordingly, braving his father's serious displeasure, he quitted Leipzig, having resolved to earn a living by his pen, notwithstanding that the calling of author was held in little or no repute. After a few months' stay in Wittenberg, he travelled to Berlin to join Mylius, a clever man, but branded as a freethinker by the orthodox. Along with him Lessing published *Beitrag zur Historie des Theaters* (1750), and independently wrote plays, translated, did literary hack-work; but his chief stay was the *Vossische Zeitung*, to which he contributed criticisms. He soon felt, however, that he himself stood in need of greater culture, and in the end of 1751 he withdrew to Wittenberg to study at leisure; at the same time he pleased his father by taking his master's degree. The result of his toil in the Wittenberg library was a series of *Vindications* (1751) of unjustly maligned or forgotten writers, such as Cardan, Lemnius, &c., in which he gave bold utterance to his strong love of justice and his scorn of narrow intolerance. Later, in *Ein Vademecum für Herrn S. G. Lange* (1754) he displayed as unrelenting an hostility to pretensions and self-satisfied ignorance. Returning to Berlin after a year's absence, he resumed his former occupations. At this time too he became intimate with Moses Mendelssohn, Nicolai, and Ramler. He also published four volumes of his collected writings, and, along with Mendelssohn, an essay on *Pope, ein Metaphysiker* (1755). But he still strove to make the theatre an engine of popular culture: he wrote the tragedy *Miss Sara Sampson* (1755), in which he revolted against French theatrical traditions in favour of English models. For *dramatis personæ* he took people of middle-class life, and so carried on the movement begun by Lillo, the dramatist, and Richardson, the novelist, in England, and by Diderot in France. The success of this work tempted Lessing back to the theatre, reopened, at Leipzig; but he only stayed

there a short time. In May 1756 he set off, as companion to a young gentleman (Winkler) of that city, on an extended tour; but they had only reached Holland when they were hastily summoned home by the outbreak of the Seven Years' War. Lessing then remained some time in Leipzig, to be near his friend the poet Ewald von Kleist.

In 1758 he was once more in Berlin, assisting Mendelssohn and Nicolai to bring out a new critical journal, *Litteraturbriefe*. In the work he did for this publication Lessing takes a distinctively higher place: he refuses any longer to submit to the degrading dictatorship of French literary taste, combats the inflated pedantry of the Gottsched school, and extols Shakespeare above Corneille as the highest type of dramatic writer. In these letters he displays most of the admirable qualities of his mature style: his insight is penetrating and sure; his manner vivacious, often ironical or satirical; his intellect is strong and logical, yet supple, and works easily; and his language is clear, forcible, and elegant. He always possessed the power of making dry subjects interesting. From November 1760 to the spring of 1765 Lessing enlarged his knowledge of men by acting as secretary to General von Tauentzien, governor of Breslau. During these years he wrote two of his greatest works, *Laocoon* (1766) and *Minna von Barnhelm* (1767). The former is a critical treatise defining the limits of poetry and the plastic arts. It affords an admirable illustration of Lessing's critical procedure. He plunges at once into the midst of the argument, takes up various views one after another, examines them, contrasts them, searches and sifts them from all sides, and exhausts upon them the resources of the dialectical method; then out of what survives this intellectual conflict he constructs his final conclusions. Yet the movement of thought is simple, natural, and logical; we are led to discover the truth by the same paths by which the author arrived at it originally. His essays on the *Fable* (1759) and the *Epigram* (1771) are both admirable instances of the same method. The comely *Minna von Barnhelm* shows no trace of imitation of foreign models: it is the first national comedy of the Germans on the grand scale, and is a great advance on Lessing's early dramatic efforts. After Frederick the Great had refused to nominate him keeper of the Royal Library at Berlin, Lessing was glad to accept the post of critic to the new national theatre at Hamburg in 1767. Out of these new duties grew the celebrated *Hamburgische Dramaturgie* (1769), in which he overthrew finally the dictatorship of the French drama and worked out the thoughts that had for many years been ripening in his mind. This theatre too soon failed, and Lessing was again left without fixed occupation. Yet he was never long idle, especially so long as there was error to combat, and ignorance and pedantic vanity to expose. For, though a scholar himself, he always regarded learning not as an end in itself, but as a means; he always accounted truth superior to mere knowledge. He was naturally fond of disputation, and so we soon find him in the thick of another controversy, this time with Klotz, a young Halle professor. On this occasion he had a double purpose to serve—to defend his *Laocoon* and to expose the pretensions of the men who set themselves up as leaders of German scholarship. The chief fruits of this controversy from Lessing's pen were *Brüder antiquarischen Inhalts* (1769) and *Wie die Alten den Tod gebildet* (1769).

In October 1769 the Duke of Brunswick offered Lessing the librarianship of the Wolfenbüttel library; he accepted it and entered upon his duties in the following May. Here at last he settled for good, and in 1776 married Eva König, the widow of

a Hamburg merchant, but lost her after little more than a year of happy married life. He at once began to publish some of the less-known treasures of the library in a series of volumes entitled *Zur Geschichte und Literatur* (6 vols. 1773-81). But in 1772 he wrote the tragedy *Emilia Galotti*, which in spite of grave faults, notably the absence of dramatic necessity for the catastrophe, is one of the greatest tragedies in German literature, certainly the greatest Lessing wrote. Shortly before his marriage he carried out a long-cherished desire, by spending eight months in Italy, though as companion to the hereditary Duke of Brunswick. His last years were occupied with theological controversies. In 1777 he published the famous *Wolfenbüttelsche Fragmente*, a rationalist attack on Christianity from the pen of Reimarus (q.v.). This book, which was almost universally attributed to Lessing, provoked a storm of replies from orthodox Lutherans. The best of Lessing's counter-attacks were the polemical *Anti-Görze* (1778), directed against his chief assailant, and the fine dramatic poem, *Nathan der Weise* (1779), one of the noblest pleas for tolerant humanity ever penned. This last was supplemented by *Die Erziehung des Menschengeschlechts* (1780), which is extremely rich in suggestive thought. Lessing's last work was *Ernst und Falk* (1778-80), five dialogues on freemasonry. He died 15th February 1781. The best edition of his *Sammeltliche Schriften* is Lachmann's, reissued by München in 1886 *seq.* His chief works have been often translated into English. See Kunt's *Lessing et l'Antiquité* (1899); Lives by Danzel and Gubrauer (2d ed. 1889), Erich Schmidt (2d ed. 1889), Sime (1877), Helen Zimmern (1878), and Rolleston (1889)—the last three in English.

Lesson (Lat. *lectio*), a reading, especially a portion of Scripture appointed to be read, as in the Common Prayer-book. The oldest Latin lectionary—a service-book, either containing the lessons for the year in full, or noting their beginning and end—was called the *Comes* ('companion'), and dates from the 5th century. The Roman Lectionary was remodelled in the 8th century. The changes in the Anglican calendar of lessons were sanctioned by act of parliament in 1871. Formerly the lessons consisted invariably of full chapters—a rule that was sometimes embarrassing, as in the case of Acts xxi.—but in the revised lectionary they are frequently shortened and differently arranged; also, nearly all the lessons from the Apocrypha have been left out.

L'Étrange, SIR ROGER, a busy royalist pamphleteer under Charles II., was born at Hunstanton in Norfolk in 1616. He narrowly escaped hanging as a spy for a plot to seize Lynn in 1644, and was instead imprisoned in Newgate, whence he escaped after four years. Pardonned by Cromwell in 1653 through personal entreaty, he lived quietly till the Restoration made him licensor of the press. He carried out his functions rigorously, but it should be remembered that such were his instructions. He fought in all the quarrels of the time with a shower of pamphlets, vigorous, and at least not coarser than those of his antagonists; and he holds a place in the history of journalism by his successive papers, *The Public Intelligencer*, *The London Gazette*, and *The Observer*. In the intervals of controversy he showed that he was not without a taste for better things by translating *Æsop's Fables*, *Seneca's Morals*, *Cicero's Offices*, the *Colloquies* of Erasmus, *Quevedo's Visions*, and *Josephus*. He died in 1704.

Le Sueur, EUSTACHE, painter, was born in Paris in 1617, and died there in 1655. The Louvre possesses 36 religious pictures by him, and 13 mythological, the former including his great series

of 20 paintings illustrating the life of St Bruno (1645-48), and his 'Preaching of St Paul' (1649).

Lethe, in Greek mythology, the stream of forgetfulness in the lower world, from which souls drank before passing into the Elysian Fields, that they might lose all recollection of earthly sorrows.

Leto. See APOLLO.

Letter of Marque (Fr. *lettre de marque*, 'a commission to plunder'; cf. Littré, iii. 456), the commission authorising a privateer to make war upon, or seize the property of, another nation. Letters of marque were abolished among European nations at the treaty of Paris in 1856. See PRIVATEER.

Letters are conventional marks or visible signs of the elemental sounds of spoken language. The earliest symbols of sounds represented syllables rather than simple sounds, and it was only gradually that syllables were reduced to their ultimate elements, all alphabets yet bearing marks of the syllabary origin and displaying various imperfections of excess and defect. The distinction between vowels (*φωνήεντα* and *φωνήεντα*) and consonants (*ἄφωνα ᾠσώμενα*) is as old as Plato's *Cratylus*, but the earlier methods of classification, which offered no definite line of demarcation, have given place to a more scientific method and more precise terminology. A consonant is the sound or noise resulting when the breath is closely squeezed or stopped at some part of the mouth or breath passage. This passage has two outlets; one at the lips, the other at the nose. In the case of some consonants the passage is closed at a given point—e.g. at the lips in *p, b*; at the teeth in *t, d*; at the palate in *k, g*; while the nose-passage is closed by the bottom (*uvula*) of the soft palate. In the case of other consonants the passage is not closed but only narrowed, and the breath sounds against the narrow walls, as in *f, s, ch*, &c. The nose channel is left open in pronouncing *n, m*. In the case of vowels the breath is not checked or closely narrowed at a given point, but passes freely through the mouth-passage, and they may be classified according to the place of their articulation in this passage owing to the horizontal or vertical movements of the tongue. They may also be distinguished as open (or wide) and shut (or narrow); in the latter there is more convexity of the tongue and a sense of effort in pronunciation. Consonants, again, are classified according to the point in the mouth-passage at which they are articulated. Furthest back we have the *guttural* sounds, with articulation of the tongue and the soft palate (*velum*), hence called the Velar Gutturals, as the sounds of *k* and *g* before the vowel sounds *a* and *o, ch* in German *wah*, and *ng* in *sing*. Further forward we have the Palatals, which result from the contact of the tongue and hard palate, as *k* and *g* before *e* and *i*. Next come the Dentals, where the tongue, teeth, and front of the palate are the instruments of articulation—e.g. *t, th, d, sh, c*. The Labials, or lip-sounds, are those which are formed either by both the lips or by the under lip and upper teeth, *p, b, m, f, v*.

Again, consonants may also be classified according to the form of their articulation. When there is a complete check or closure of the mouth passage at the point of articulation, consonants are called Mutes or Stopped or Explosives, as *k, g, t, d, p, b*. The ancient grammarians divided mutes into *Tenuis* and *Medar*, the former including *k, t, p*, the latter *g, d, b*. When the mouth-passage is narrowed but not completely closed at the point of articulation, we have the Open or Fricative consonants, such as *r, s, f, z, c*, the last four of which are also called Spirants. When the passage is stopped in the

middle but kept open at the sides, we have a *Divided* sound, such as *l*. When the nose-passage is left open we have the *Nasals* *m* and *n*. *N* takes its character from the nature of the neighbouring sounds—e.g. it is guttural in *sink*, but dental in *let*.

Again, consonants may be divided into Voiced and Voiceless. The voiced or soft consonants are pronounced with a vibration of the vocal chords. To this class belong the Nasals *n, m*; the Liquids *l* and *r*; the Media *g, d, b*; the Aspirated Media *gh, dh, bh*; and the Spirants *z, j, v*. The Voiceless or Sord consonants are the Tenues *p, t, k, q*, the Aspirated tenues *kh, th, ph*, and the Spirants *s, f*.

There are some sounds which can play the part of either consonants or vowels, as the Semi-vowels *i* and *u*. In the same way, *m, n, r, l* between vowels are purely consonantal, but before or after consonants they can be vocalised or made *sonant*. Besides all these different sounds we have the introductory *glides*, represented by the smooth and rough breathings.

Such is the variety and complexity of the different sounds which are attempted to be represented in the letters of alphabets. These, however, merely satisfy roughly practical needs, and in no case represent all the sounds actually employed in any language. Accentuation, which is an important element of speech, is rarely denoted, and still more rarely is quantity. The alphabetic symbols remain comparatively unchanged, while the sounds they represent are constantly changing. Hence the literary spelling often corresponds but indifferently with the actual sounds of the words, and in English especially this has grown into so heavy an additional burden on the memories of learners that many scholars have been led to advocate the adoption of a scientific *phonetic* system of spelling. Thus, in English there are at least forty-three easily distinguished sounds, while the written alphabet has only twenty-six letters or symbols to represent these. Again, our alphabet is redundant, containing three superfluous letters, *c, y, x*, so that there are actually but twenty-three letters wherewith to represent forty-three sounds!

Many persons amongst ourselves are unable to pronounce certain letters, as *l* and *r*; others change *r* or *l* to *d*, and we observe that children for some time habitually substitute dentals for gutturals, as *bat* for *cat*, *tess* for *kess*. This is quite distinct from phonetic diversification which follows certain definite laws, the observation of which formed the basis of scientific etymology. We find that some languages lack certain sounds which to us seem indispensable. Thus, the Mohawks and Hurons employ no labials; the Society Islanders are destitute of gutturals (the name of Captain Cook became *Tate*), and the Australian dialects of *s*, as are also several of the Polynesian languages, where its place is taken by *h* (cf. Lat. *sal* and Gr. *hals*). Again, *d* is never used in Chinese, Mexican, or Peruvian; *u* is absent in the language of the Hurons; and even in so perfect a language as Sanskrit we have no *f*, no soft sibilants, no short *e* and *o*. Greek has no *y*, no *w*, no soft sibilants; Latin has no soft sibilants, no native *θ, φ, χ*; English is deficient in guttural breathings like the German *ach* and *ich*, although these are plentiful enough in Scotland. High German has no *w* like the English *w* in wind, no *th, dh, ch, j*. While Sanskrit has no *f*, Arabic has no *p*. The letter *f* is absent in Finnish (despite the name—given it by its neighbours), Lithuanian, Tamil, Mongolian, and Burmese. No Chinaman ever pronounces *r*, Christ being rendered *Ki li xse tu*. It is also absent in the language of the Hurons, Mexicans, and Kaffirs. Max Müller gives the following enumeration of the consonants in a few alphabets: Hindustani has 48 consonants, of which

13 are classical Sanskrit aspirates, nasals, and sibilants, and 14 Arabic letters. Sanskrit has 37 consonants (or with the Vedic *l* and *lh*, 39); Turkish, 32 (of which only 25 are really Turkish); and Persian, 31 (of which 22 are really Persian, the rest Arabic). Arabic has 28; the Kafir (*Zulu*), 26, besides the clicks. Hebrew has 23; English, 20; Greek, 17 (3 compound); Latin, 17 (1 compound); Mongolian, 17 or 18; Finnish, 11; Polynesian, 10 native consonantal sounds; some Australian languages, 8; of the Melanesian languages the poorest, the Dnauru, has 12, others 13, 14, and more. Again, some races find exceeding difficulty in distinguishing some of our sounds. Thus, the Sandwich Islanders habitually confuse *k* and *t*, and we find the same word written by Protestant missionaries with *k*, by French missionaries with *t*. Even in Canada the lower classes say *netkier* and *moikie* for *netier* and *moitie*. And even so respected a lexicographer as Noah Webster actually says in the Introduction to his Dictionary that in English the letters *cl* are pronounced as if written *tl*, and *gl* as if *dl*.

The foregoing is mainly taken from the following: J. E. King and C. Cookson's admirable *Principles of Sound and Inflection* (1888), their *Introduction to the Comparative Grammar of Greek and Latin* (1890), and Max Müller's *Lectures on the Science of Language* (2d series, lect. iv, 1864). See also the articles in the present work on ALPHABET, GRAMMAR, GRIMM'S LAW, PHONETICS, SPELLING, and on each of the letters of the alphabet.

Letters forms one of the most delightful branches of literature, and one moreover in which English possesses abundance of the finest examples. Most biographies that are now written contain the letters of the hero, and these usually open up his heart to the reader far better than pages of description of his qualities; while they also supply, by conscious or unconscious self-revelation, something of the peculiar interest that belongs to autobiography. But here may be remembered the warning words of Dr Johnson written *a propos* of Pope: 'There is no transaction which offers stronger temptations to fallacy and sophistication than epistolary intercourse. In the eagerness of conversation the first emotions of the mind often burst out before they are considered; in the tumult of business interest and passion have their genuine effect; but a friendly letter is a calm and deliberate performance in the cool of leisure, in the stillness of solitude, and surely no man sits down to depreciate by design his own character.' It is unhappily the fact that the conditions of modern life are generally unfavourable to the production of letters of the best class, which are the fruit of calm and ample leisure no less than of sympathy. The railway, the penny post, the telegram, and the postcard have combined to destroy letter-writing as a pursuit and an art. There is nowadays scarcely such a thing as *correspondence* in its good old sense—what Southey calls 'perhaps the greatest gratification which the progress of civilisation has given us'; letters are only written when necessary, and consequently are too often completely impersonal and entirely uninteresting. Hence familiar letters, intimate and easy in tone, fluent and seemingly careless in style, have almost disappeared, and in their stead we have only the ephemeral, bald, disjointed, essentially unliterary, and it may even be ungrammatical productions, which, the moment their immediate purpose is served, are straightway consigned to the extinction for which they are fitted, and to which end indeed they were designed.

Of letters Bacon says 'such as are written from wise men are of all the words of man, in my judgment, the best; for they are more natural than orations and public speeches, and more advised than conferences or present speeches. So again letters of state from such as manage them, or are

privity to them, are of all others the best instructions for history, and to a diligent reader the best histories in themselves.' Undoubtedly this is true, and the letters of such men as Cassiodorus, Cromwell, Marlborough, Nelson, Washington, and Wellington, as well as such vast collections as the Cecil Correspondence, and the like, will remain documents of the first importance to the historian; while the theologian will never cease to count the epistles of Gregory Nazianzen, Basil, Chrysostom, Ambrose, Augustine, and Jerome among the richest sources available for a close study of the development of dogma and the movement of ecclesiastical history. Again, such collections as Pascal's *Provincial Letters*, Swift's *Draper's Letters*, and the *Letters of Junius* only belong in a secondary sense to this department of literature, and lack the peculiar personal charm that belongs to such letters as those of Cicero, Horace Walpole, or Madame de Sevigne.

Of all the favourite letter-writers of the world Cicero is both the earliest and remains almost the greatest. More than 800 of his letters are extant; and all are natural, sincere, outspoken. The very frankness of his vanity and an almost feminine desire to please give a singular pleasure to his reader; and his own phrase in one of his letters—'fit enim nescio quid ut quasi coram adesse videar cum scribo aliquid ad te'—reveals in a single sentence the secret of his perennial charm. And he was singularly happy in a correspondent so sympathetic and intelligent as Atticus, to whom alone he sent as many as 400 letters, for Montaigne tells us how the want of such a judicious and indulgent friend to whom to address kept him from adopting the epistolary method for publishing his whimsies which otherwise he would have preferred. The only other important Latin letter-writers are Seneca and Pliny, but the one offends by prosy and tedious moralising, the other by a prolix and grandiose manner that soon proves tiresome.

The Paston letters, over 1000 in number, are lucid and unaltered and give us our best insight into the inner domestic life of the 15th century; but the earliest English letter-writer of high rank is James Howell, whose *Familiar Letters* shared with Montaigne the honour of being one of Thackeray's two 'bed-side books.' Howell says 'familiar letters may be called the *larum bells of love*,' and elsewhere admirably describes his own compositions in the sentence—'that's a true familiar letter which expresseth one's mind, as if he were discoursing with the party to whom he writes, in succinct and short terms.' Nowhere can we find more shrewdness, wit, wisdom, and keenness of observation, all combined with heartiness and sincerity; none knows better how to brighten his page with a merry quip or a lively story.

But our greatest letter-writers remain but three, or at most four; Gray, Horace Walpole, Cowper, and Charles Lamb. Gray's work is fastidious, precise perfect, but never laboured, and always completely sincere. It suggests the finished scholar unbending to please a friend, and the perfection is a consummation that came of itself, unstudied and unsought. Pope and Bolingbroke wrote for fame—their writing ever suggests an intellectual exercise, and even the letters between Pope and Swift are never entirely free from consciousness; but Gray wrote for love, and his letters, with those of Cowper and Charles Lamb, stand by themselves. Horace Walpole said of himself that he lived 'a life of letter-writing,' and he remains pre-eminent alike in the number and the remarkable felicity of his letters. He is by turns gay, good-humoured, piquant, keen, sarcastic, but is always clever and often even genial, although not seldom the reader detects the presence of effort and affectation. Still, all defects apart, judged in respect of both quantity and quality, and

of the extraordinary range of subjects handled, he remains without a rival the prince of English letter-writers.

Lady Mary Wortley Montagu's letters are unusually lively, clever, and amusing, but are marred by a constitutional indelicacy of tone as well as a vanity and a consciousness of skill that will not hide. Chesterfield's letters to his natural son show great shrewdness and powers of observation in a finished if over-elaborated style, but reveal a moral meanness of view that stamps the finished man of the world as but a sorry gentleman. The letters to his godson, written in later life, and first published by the late Lord Carnarvon in 1889, show a higher tone, but are poor performances if judged from the point of view of letters written to a child. The letters of Dorothy Osborne to Sir William Temple are delightful beyond most; those of Sir William himself, so long admired as models of serene and stately English, have ceased to interest the modern reader. But Lady Rachel Russell's letters, the apologetic scraps written by Steele to his wife Prue, and Swift's letters to Stella preserve a charm that defies the touch of time. Other 18th-century letters of interest are those of Mrs Delaney, covering half a century, Fanny Burney, Miss Berry, one of Walpole's later correspondents, and Hannah More. Dr Johnson's letters are always admirably vigorous and direct, and one at least is among the most memorable things in English literature; but he never put his strength into this form, and indeed disliked to write freely in letters from the after-use that might be made of them. Jane Austen's letters are not characteristic of her unique genius; Burns's are artificial and disappointing; Sterne's mawkish and unreal; Goldsmith's good, but few and unimportant. But the century closes well with the inimitable masterpieces of Cowper, throughout full of tenderness, grace, vivacity, wit, and sense.

Of 19th-century letters the characteristic examples of Charles Lamb stand first. Even the slightest show the peculiar charm of his touch, and all are stamped with the sign-manual of genius. Scott's letters are hearty, genial, and honest; Byron's clever, trenchant, and somewhat unreal. There are many good letters of Southey, Crabbe, Sydney Smith, Leigh Hunt, De Quincey, Lockhart, Macaulay, Dr Arnold, Hood, Washington Irving, Emerson, Carlyle, Lady Duff Gordon, and Ruskin. Thirlwall's *Letters to a Friend*, and Thackeray's *Letters*, published in 1887, are unusually good collections. Shelley is an author not yet judged sensibly by either set of readers, but it is enough to say of his letters that they are neither so much above his poetry as Matthew Arnold would place them nor as far below it as they appear to Mr Swinburne. The letters of Mary Godwin to Inlay, written towards the close of the 18th century, are deeply interesting; those of Keats to Fanny Brawne do injustice to the memory of a sovereign poet, and should never have been printed. But indeed the love-letter is almost always a flower that will not bear being plucked from the stalk on which it grew, and those that are nowadays too often read aloud in breach-of-promise cases are almost always as unreal as the short-lived passion that inspired them. Of later 19th-century English letters none stand out greater than those of Mrs Carlyle and Edward Fitzgerald, which have indeed already been lifted into the rank of the English classics in this kind.

Of German letter-writers it may be enough to name Schiller, Goethe, and Humboldt; of French, Voiture, Madame de Maintenon, Madame du Defand, Sainte Beuve, George Sand, Merimee, and the unapproachable name of Madame de Sevigne. The sovereign quality of this great letter-writer is her naturalness and goodness of heart, combined with

an unmatched facility of sympathetically realising the emotional experiences of others, and of adding reality and life to everything she touched. None ever possessed in richer measure the woman's gift of that warmer interest in the smaller commerce of life, and that aptitude for treating social or public matters from the private and personal point of view which give half their charm to the letters of women. She tells her daughter, to whom she wrote with overflowing affection for twenty-five years, that she lets her pen 'run on and take its own way. . . . I commence always without knowing how far I shall go; I know not whether my letter will be long or short.' Horace Walpole says of her, 'She has the art of making you acquainted with all her acquaintance, and attaches you even to the spots she inhabited.' There is no writer whose inherent goodness has been repaid with a warmer love than Madame de Sévigné, or whose supremacy upon an intellectual throne is less likely ever to be shaken.

The English reader will find the form of the ancient Roman letter in the example preserved in Acts xxiii. The modern English letter differs from the older only in being somewhat less ceremonious and less varied in form. Thus, 'sir' alone was once nearly universal as the form of address, but is now considered cold. Again, 'honoured sir' and 'respected sir' have almost disappeared, and unhappily also such beautiful forms as 'heart' and 'sweet-heart.' Howell often ends with 'yours inviolably,' 'yours entirely,' 'yours in no vulgar way of friendship,' Horace Walpole says 'yours very much,' 'yours most cordially,' and once, to Hannah More in 1789, 'yours more and more.' Puritan writers often used forms strange to modern ears, such as 'yours in the bowels of Christ.' Baxter in his *certain epistolare* with Peter Heylin delightfully subscribes himself 'yours in so far as you are for the truth.' In earlier times it was customary to add on the outside directions to the bearer, as 'Haste, ha-te,' and in official letters even such pointed provocatives of speed as 'Ride, ride, for your life.' Underlining is a detestable practice, equivalent to a confession of weakness in being forced to borrow strength from adventitious aid, and crossing is a device happily practised by but few men at least, although it had its use in days of dear postage. Many, however, indulge in a *postscript*, without which it is said no lady's letter is complete.

The earliest guide to letter-writing extant is Angel Day's *English Secretary* (1599). Another, by Gervase Markham, is entitled *Concited Letters; or a most Excellent Bundle of New Wit* (1618). Forms of letters, with much else, were also given in the popular *Academy of Compliments* (1671). Of such books there is now great abundance; but, while occasionally helpful, they are by no means an unmixt blessing, being no doubt responsible for many ridiculous phrases that are in too common use. But to them the world owes the masterpieces of Richardson, who, in his labours upon a guide to correspondence, discovered that he could write novels that could melt the hearts of the women.

See William Roberts, *History of Letter-writing, from the Earliest Period to the Fifth Century* (1843); Charles Knight, *Half-hours with the best Letter-writers and Autobiographers* (two series, 1867-68); George Seton, *Gossip about Letters and Letter-writers* (1870); W. Baptiste Seaman, *Four Centuries of English Letters* (1880); and Robert Cochrane, *The British Letter-writers* (1882). The two last books are excellent collections, full, yet admirably selected. There is a collection of *Love Letters of Famous Men and Women of Past and Present Centuries* (2 vols., 1888) by Mr. Merydew. The copyright of letters remains with the writer (see COPYRIGHT).

Letters. For Letters Patent, see PATENTS; for Letter of Attorney, see ATTORNEY.

Letter-wood. See BREAD-NUT.

Lettres de Cachet, the name given to the famous warrants of imprisonment issued by the kings of France before the Revolution. All royal letters (*lettres royales*) were either *lettres patentes* or *lettres de cachet*. The former were open, signed by the king, and countersigned by a minister, and had the great seal of state appended. Of

this kind were all ordinances, grants of privilege, &c. But these checks on arbitrary power did not exist with regard to *lettres de cachet*, also called *lettres closes*, or sealed letters, which were folded up and sealed with the king's little seal (*cachet*), and by which the royal pleasure was made known to individuals or to corporations, and the administration of justice was often interfered with. The use of *lettres de cachet* became much more frequent after the accession of Louis XIV. than it had been before, and it was very common for persons to be arrested upon such warrant, and clapped into the Bastille (q.v.) or some other state-prison; where some of them remained for a very long time, and some for life, either because it was so intended, or, in other cases, because they were forgotten. It was not always for political reasons that *lettres de cachet* were obtained: sometimes private persons got troublesome members of their families brought to reason in this way. The lieutenant general of the police kept forms of *lettres de cachet* ready, in which it was only necessary to insert the name of the individual to be arrested. Sometimes an arrestment on *lettres de cachet* was a resource to shield criminals from justice.

Letts, a branch of the Lithuanian race, who in manners, customs, and mode of living do not differ much from the Lithuanians proper. They live in south Livonia, in Courland, and Vitelsk, and in the north of Kovno in Russia, and number about 1,200,000 persons. Early converted to Christianity by the Teutonic Knights, they are now mostly Lutherans, though some 50,000 have been won over to the Greek Church. All are peasant agriculturists: since the abolition of serfdom they have made remarkable progress, both socially and intellectually. Their language is not so archaic as Lithuanian; but they possess valuable treasures of popular poetry, proverbs, riddles, &c. See Umann, *Lettsche Volkslieder* (1874), and Bielenstein, *Ein Tausend Lettsche Rätsel* (1881); also Von Darneth, *Die Letten unter den Deutschen* (2d ed., 1887), and C. F. Watson, *Ueber den Lettschen Volksstamm* (1822).

Lettuces (*Lactuca*), a genus of plants belonging to the natural order Compositae, sub-order Cichoraceae. The Garden Lettuce (*L. sativa*) is supposed to be a native of the East Indies, but is not known to exist anywhere in a wild state, and from remote antiquity has been cultivated in Europe as an esculent, and particularly as a salad. It has a leafy stem, oblong leaves, a spreading, flat-topped panicle, somewhat resembling a corymb, with yellow flowers, and a fruit without margin. It is now generally cultivated in all parts of the world where the climate admits of it; and there are many varieties, all of which may, however, be regarded as sub-varieties of the Cos Lettuce and the Cabbage Lettuce, the former having the leaves more oblong and upright, requiring to be tied together for blanching the latter with rounder leaves, which spread out nearer the ground, and afterwards *ball* or roll together into a head like a small cabbage. The lettuce is easy of digestion, gently laxative, and moderately nutritious. The white and somewhat narcotic milky juice of this plant is inspissated, and used under the name of *Lactucarium* or *Thalassar* as an anodyne, sedative, opiate medicine. The best and most useful kind of this juice is obtained by making incisions in the flowering stems, and allowing the juice which flows to dry upon them. In mild winters they may be kept ready for planting out in spring. The other species of this genus exhibit nothing of the bland quality of the garden lettuce. The Strong-seeded Lettuce (*L. virosa*) is distinguished by the prickly keel of the leaves, and

by a black, smooth seed, with a rather broad margin. It is found in some parts of Britain. *Lactucarium* is prepared from its fresh gathered leaves in the flowering season. The leaves have a strong and nauseous, narcotic and opium-like smell. *L. perennis* adorns with beautiful blue flowers the stony declivities of mountains and clefts of rocks in some parts of Germany, as in the Harz, &c., but is not a native of Britain, which, however, possesses one or two other species in qualities resembling *L. virosa*.

Leucadia. See LEUKAS.

Leuchtenberg. See BEAUFARNAIS.

Leucine, or AMIDO-CAPROIC ACID, a product of the decomposition of albuminous materials occurring in many of the juices of the animal body; formula $C_8H_{11}O_2NH_2$. A substance isomeric, but not identical, with natural leucine can be prepared artificially.

Leucippus, the founder of the Atomic School of Greek philosophy, and forerunner of Democritus (q.v.), was born in Abdera, and flourished in the beginning of the 6th century B.C.

Leuciscus, a genus of fresh-water fishes, of the family Cyprinidae, containing a great number of species, among which are the Roach, Dace, Chub, Minnow, &c.

Leucite (Gr. *leukos*, 'white'), a rock-forming mineral which occurs in the form of icositetrahedra belonging to the cubical system. It has a hardness = 5.5 - 6, and a specific gravity = 2.45 - 2.50. The colour is white, ash-gray, or smoke-gray. It usually contains many inclusions, such as olivine, argite, and other minerals, together with glass enclosures, gas-bubbles, and occasionally fluid lacuna. Unlike cubical minerals, it exhibits a certain degree of double refraction, believed to be due to conditions of unequal tension existing within the crystals. When exposed to a temperature of 500° C. the crystals become perfectly isotropic. Leucite occurs only in volcanic rocks, and those in which it occurs have a restricted distribution.

Leuckart. RUDOLF, zoologist, was born 7th October 1822 at Helmstadt, and studied at Göttingen. In 1850 he became professor of Zoology at Giessen, and in 1869 at Leipzig; he specially distinguished himself by his study of the Entozoa. His great work is *The Parasites of Man* (Eng. trans. by Hoyle, 1886). He died 6th February 1898.

Leucocythemia (Gr. *leukos*, 'white,' *cythos*, 'a cell,' and *haima*, 'blood') is a disease in which the number of white corpuscles in the blood is greatly increased, while there is a simultaneous diminution of the red corpuscles. The disease was noticed almost at the same time (in 1845) by John Hughes Bennett of Edinburgh and Virchow of Würzburg; the former giving in 1852 the name *Leucocythæmia*, while the latter gave it in 1847 the less expressive name of *Leukæmia* or *White Blood*. The increase of the white or colourless corpuscles seems to be always accompanied, and probably caused, by changes in some of the lymphatic tissues of the body. Of these by far the most common is enlargement of the spleen, which sometimes attains an enormous size. In many cases this is associated with enlargement of lymphatic glands, and less commonly with a peculiar change in the marrow of the bones; and occasionally one or both of these conditions may be present without enlargement of the spleen.

The first symptom usually noticed by the patient is enlargement of the abdomen, in consequence of the increase in size of the spleen. Weakness, breathlessness, hæmorrhages in various situations, and often enlargement of the liver succeed; and the disease almost always proves fatal in two or

three years at most. It may occur at any age; but is most common between twenty and fifty, and in the male sex. Nothing is known as to its cause, except that a considerable proportion (one-fifth or more) of those affected have at some previous time suffered from ague. Treatment seems sometimes to have proved effectual in the early stages; cases have been recorded where quinine, phosphorus, cod-liver oil, iodide of iron have arrested what appeared to be commencing leucocythemia. But after the disease is fully established all treatment has as yet proved unavailing.

Leucol. C_8H_7N , is an organic base obtained by the distillation of coal-tar, and is isomeric with quinoline.

Leucoma is the term applied to a white opacity of the cornea (see EYE). It is the result of acute inflammation, giving rise to the formation of cicatricial tissue on the ulcerated surface, or between the layers of the cornea. It is sometimes re-absorbed on the cessation of the inflammation, and the cornea recovers its transparency; but in many cases it is persistent and incurable.

Leucorrhœa (Gr. *leukos*, 'white,' and *rhœ*, 'I flow'), popularly called *whites*, is the name applied to an abnormal mucous or mucopurulent discharge from the female generative organs. It is a prominent symptom in many forms of female disease; and the treatment must be directed to the morbid condition on which it depends. Antiseptic or astringent vaginal douches are generally of use in diminishing the excessive secretion and the annoyance caused by it.

Leuctra, a village of Boötia, in ancient Greece, famous for the great victory which the Thebans under Epaminondas (q.v.) here won over the Spartan King Cleombrotus (371 B.C.).

Leuk (Fr. *Loèche*), a town (pop. 1411) in the Swiss canton of Valais, on the right bank of the Rhone, 15 miles above Sion. It is the railway station, on the Simplon railway, for the *Baths of Leuk* (4643 feet above sea-level), situated 5 miles northward at the head of the Dala gorge and the foot of the ascent over the Gemmi pass. At this hamlet of 650 inhabitants there are lodging-houses and hotels for the accommodation of patients and travellers. The springs have a high temperature (124-199° F.), are saline, chalybeate, and sulphureous, and are used both for drinking and bathing, chiefly in skin and stomacheal diseases. The patients (mostly French, Swiss, and Italians) remain many hours in the water, talking, reading, &c. See guide-books by Brunner (5th ed. 1887), Wolf (1886), and Von Werra (1886).

Leukas, LEUCADIA, or SANTA MAIRA, one of the Ionian Islands, lies close to the west coast of Greece; about 660 B.C. the Corinthians cut through the peninsula that joined it to the mainland. It resembles the Isle of Man in shape, and is 20 miles long by 8 wide, with an area of 110 sq. m. The backbone of the island is a ridge of white lime stone; hence the name (*leukos*, 'white'). Wine, olive-oil, and currants are the principal products. The island is much subject to earthquakes. Pop. 25,000, chiefly Greeks. The west coast is bold and precipitous, and terminates south in the abrupt headland (200 feet) known to the ancients as the Leucadian rock, on which stood a temple to Apollo, and from which once a year a criminal was hurled into the sea by way of sacrifice. It was from the same point that Sappho, the poetess, and Artemisia of Halicarnassus threw themselves into the waves.

The capital, Amaxioli or Lenkas, on the east coast, is the seat of an archbishop, and has a population of 3800. It was nearly destroyed by an earthquake in 1825. Venice was mostly mistress

of this island from 1684 to 1800; it was occupied by Britain in 1810. See IONIAN ISLANDS; also an account of the island by Partsch in *Ergänzungsheft*, 95, to *Petermann's Mittheilungen* (1889).

Leuthen, a village of Prussia, in Lower Silesia, 10 miles W. of Breslau, celebrated for the victory won there, 5th December 1757, by Frederick the Great, with 34,000 men, over the Austrians under Prince Charles of Lorraine at the head of 90,000. The Austrians lost 10,000 killed and wounded, 12,000 prisoners, and 116 pieces of artillery; the Prussians, 6,500 killed and wounded. The result was the reconquest of the greater part of Silesia by the Prussians.

Leutze, EMANUEL, painter, was born at Gmünd, in Wurtemberg, in 1816, was brought up by his parents in America (at Philadelphia and at Fredericksburg, Virginia), and afterwards studied and painted in Europe from 1841 to 1859, his home for fourteen years being at Düsseldorf. He settled in New York city in 1859, and died at Washington, 18th July 1868. His works include three scenes from the life of Columbus, several from English history, and a number depicting events in the war of the Revolution, including 'Washington crossing the Delaware.' One of his last works was the 'Westward Ho' mural picture for the staircase of the capitol at Washington.

Leuwenhoek. See LEEUWENHOEK.

Levaillant, FRANÇOIS, traveller and ornithologist, was born in 1753 of French parents living at Paramaribo, in Dutch Guiana. In 1777-80 he studied natural history in Paris, and then spent more than two years in exploring the southern parts of South Africa (1781-84). His death occurred at Sézanne, south of Epernay, on 22d November 1824. He published accounts of two of these expeditions, not altogether free from imaginative details and exaggerations, under the title *Voyages dans l'Intérieur de l'Afrique* (1790-96). Several books by him on birds are marred by the same faulty tendencies; those on African birds, on the new and rare birds of America and India, and on paroquets are the most valuable.

Levant (from the Ital. *Levante*, the 'Orient,' or 'Rising'—i.e. the East), a name employed to designate the eastern parts of the Mediterranean Sea and the coast regions of Syria, Asia Minor, and Egypt. In a wider sense, it is applied to all the regions eastward from Italy, as far as the Euphrates and the Nile.—*Levantine* is a name given to persons mainly of Frank extraction born in Turkey and the towns of the Levant.—*Levanter* is a stormy wind blowing up the Mediterranean from the Levant.

Levéé, the French name, used also on the Lower Mississippi (q.v.), for an embankment.

Levéé, originally a reception held in the monarch's bedchamber at the hour of rising (Fr. *lever*). See COURT, PRESENTATION AT.

Levellers, an ultra-republican sect or party which became noticeable in the parliamentary army in 1647, and two years later produced a formidable mutinous outbreak. The chief leader was John Lilburne (1618-57), who, whipped and imprisoned by the Star Chamber in 1638, had risen in the army to be lieutenant-colonel. He became an indefatigable agitator; thought Cromwell's republic too aristocratic, and demanded greater liberty of conscience and numerous parliamentary reforms; and was repeatedly imprisoned for the treason in his pamphlets. A part of the army mutinied in April 1649 in support of like views, and soon there were a thousand insurgents, who were speedily surrounded near London and forced by Cromwell into surrender.

Similar risings elsewhere were also swiftly dealt with.

Levelling. Level is a term applied to surfaces that are parallel to that of still water, or perpendicular to the direction of the plumb-line; it is also applied to the instrument employed in determining the amount of variation from perfect levelness. The instrument is a cylindrical glass tube very slightly convex on one side, and so nearly filled with water, or, what is better, with alcohol, that only a small bubble of air remains inside. The level is then mounted on a three or four legged stand, with its convex side upwards, and by means of a pivot and elevating screws is made capable of assuming any required position. If the level be properly constructed the bubble should lie *exactly* in the middle of the tube when the instrument is properly adjusted, and at the same time the line of sight of the telescope attached to the level should be accurately parallel to the surface of still water. In ordinary levels this first condition is seldom seen, and, instead, two notches are made on the glass to mark the position

of the two extremities of the bubble when the instrument is level. The tube and bubble should be of considerable length to ensure accuracy. The leveller requires two assistants, each furnished with a pole from 10 to 14 feet high, and graduated to feet and inches, or feet and tenths of feet. If he wishes to measure the height of A above B, he may do this by beginning either at A or B. Let the latter be the case: then one assistant is placed at B, holding his pole upright; the other is sent forward to C (which must be below the level of the top of the pole at B); the surveyor, who places himself between them, reads off the height Bb, which he puts down in the back-sight column of his book, and then turns the level to C, reading off Cm, which is entered in the front-sight column. The surveyor and his assistant at B then take up new positions, the latter at D; the back-sight Cc and the front-sight Dd are read off, and the process is repeated till one of the assistants reaches A. The excess of the sum of the back-sights over that of the front-sights gives the height of A above B. A little consideration shows that this method only holds true when practised on a small scale, and consequently in extensive surveys the level (as found by the above method) must be reduced by an allowance for the earth's curvature. See works by F. W. Stumms (1884) and T. Holloway (1887).

Leven, a small seaport and police-burgh (1867) of Fife, on the Firth of Forth, at the mouth of the river Leven, 11 miles by rail N.E. of Kirkealdy. Pop. (1841) 1827; (1881) 3568; (1891) 4577. A good golf-links adjoins the town.

Leven, LOCH, a salt-water loch, between Argyll and Inverness shires, extending 11½ miles westward to a junction with Loch Linne, near Ballachulish, and broadening to 2½ miles. Its scenery is savage, and the flow and ebb of the tide very strong. See also LOCHLEVEN.

Lever. an inflexible rod—straight or bent, as the case may be—supported at some point of its length on a prop which is called the *fulcrum*, and having a *resistance* to be overcome and *power* to overcome it applied at other two points. The general principle governing levers of all sorts is

Fig. 1.

that the power and the resistance must tend to produce opposite rotations round the fulcrum, and that their moments—the product of either of them into the shortest distance between the line of the direction of its application and the fulcrum—must be numerically equal; or, in other words, the power and the resistance are in the inverse ratio of their respective

Fig. 2.

shortest distances from the fulcrum. When this is the case there is equilibrium; when either 'moment' predominates there will be rotation. These conditions may be fulfilled whether the power P, the fulcrum F, and the resistance W stand in the order PFW, PWF, or WPF; and hence levers are popularly divided into three classes. In the first class (PFW)—fig. 1 for a straight lever, fig. 2 for a bent one, equivalent to a straight lever since P and W are parallel—we have the Balance (q.v.), the spade (when used for raising earth), the seesaw; or, as double levers, scissors and pincers. In the second class (PWF, fig. 3) we have crowbars (P the hand, W the resistance of the body pushed, F the ground), boat-oars (P the hands, W at the rowlock, the resistance of the boat, F the comparatively fixed position of the oar-tip in the water), wheelbarrows; and, as double levers, nutcrackers (P the hand, W the nut, F the hinge).

Fig. 3.

In the third class (WPF, fig. 4) we have fishing-rods, whips, umbrellas, and most instruments used with the hand alone, and coal- and sugar-tongs; and many instances in the muscular system—e.g. the biceps muscle and forearm of man (fig. 5), his deltoid muscle and shoulder, the pectoral muscle and wing of birds. Levers of the third class always work at a mechanical disadvantage as regards power; but what is lost in power is gained in speed and range of movement—e.g. the biceps muscle, since CA, fig. 5, is about one-sixth of the distance between the elbow-joint and the palm of the hand, must exert a 6 lb. pull on A in order to raise a 1 lb. mass in the hand (setting aside the weight of the forearm itself). Levers of the second order always act at a mechanical advantage as regards power; and in those of the first order a given pressure may overcome a greater, an equal, or a less resistance, according to the ratio of the arms. A subsidiary advantage of levers of the second order is that when a man lifts weight by one of the first order his power is limited to his own weight hung on the lever, whereas with one of the second order his push or pull is upward,

Fig. 4.

and he is thus able to exert his full muscular strength.

Fig. 5.

When a large mechanical advantage is required this may be obtained, without using bars inordinately long, by means of a combination of them (as in fig. 6). Here the levers have their arms in the ratio of 3 to 1, and a little consideration will make it plain that a power, P, of 1 lb. will balance the weight of 27 lb. But in this instance the particular defect of the lever as a mechanical power shows itself prominently; for if the 27 lb.

Fig. 6.

mass has to be lifted two inches, the power requires to act downwards through (2 x 27 or) 54 inches; and, as the extent of sweep of the power cannot be largely increased without inconvenience, the advantages of this contrivance are confined within narrow limits.

Lever. CHARLES, a popular novelist, chiefly remembered for the rollicking fun of his Irish stories, was born in Dublin, 31st August 1806. He graduated at Trinity College, Dublin, in 1827, and then removed to Gottingen, where he studied medicine, and subsequently returned to Dublin to complete his academic career. His most popular work, *Charles O'Malley*, is a reflex of his own college life in Dublin, and many of the incidents in the novel, as in many of his late productions, are drawn from his own experiences of the world. Probably in 1824, and certainly at some time between 1827 and 1832, he spent a considerable time in the backwoods of Canada and North America, and subsequently embodied his experiences in *Con O'gregan* and *Arthur O'Leary*. Returned to Ireland, he practised medicine first at Kilmish in County Galway, and afterwards at various other country towns, collecting material for his stories of Irish country life. Having married a Miss Baker, he went in 1837 to practise medicine at Brussels, and while there wrote *Harvey Lorrequer*, and afterwards *Charles O'Malley* for the *Dublin University Magazine*, then recently started. Returning to Dublin, he published *Jack Hutton* in 1841, and from 1842 to 1845 acted as editor of the *Dublin University Magazine*, and wrote *Nuts and Nutcrackers*, *Arthur O'Leary*, *Tom Burke of Ours*, and *The O'Donoghue*. In 1845 he again went off to the Continent, going first to Brussels, then to Bonn and Carlsruhe, where he lived for some time, and published the *Knight of Guyenne*. He then moved on to Florence, and wrote *Roband Cashel*, and thence to Spezzia, where *Luttrell of Arran*, *Con O'gregan*, *Sir Jasper*

Carver, and *The Dodd Family Abroad* were produced in rapid succession. Then, suddenly and completely changing his style, he wrote the *Fortunes of Glenore*, followed by a truly Irish story, *The Martins of Cro-Martin*, and *The Doltons*, the hero of which is an Englishman travelling on the Continent. Lever was then, in 1852, appointed by Lord Derby to be British vice-consul at Spezzia, and continued to write, publishing *Davenport Dunn, One of Them, Gerald Fitzgerald, Sir Brooke Fushbrooke, That Boy of Norcotts*, and contributing some racy papers to *Blackwood's Magazine* under the sobriquet of 'Cornelius O'Dowd.' On May 2, 1867, he was promoted by his old patron Lord Derby to the consulship at Trieste, where he died 1st June 1872. Lever's later books, though marked by greater care and more thought than those of the *Lorrequer* school, and even that strange and brilliant composition entitled *A Day's Ride*, are already dead; and it is only by his brilliant and racy sketches of a phase of Irish life which was passing away even as the sympathetic young chronicler caught its features that Lever still lives, and may continue to live when Ireland is as dull as Lincolnshire and as orderly as Clapham. Lever's wandering life on the continent of Europe, and especially in Belgium, where he fell in with a great number of Peninsular and Waterloo officers, and collected a vast store of traditions of the great battles and of those who fought them, gives an additional zest to many of his books. They are all something more than mere sketches of rollicking in Ireland, and their boisterous fun is relieved, and even refined, by constant changes of scene, the reflex of Lever's own wandering and wayward life, and of his own restless genius.

One unfortunate result of Lever's novels has been to create a false idea of Irish society, and still more of the Irish character. The Irish of to day at least are singularly unlike those portrayed in the novels of the *O'Malley* type, and, much as the social conditions of the country have altered in the last sixty years, a great deal of what was carelessly dashed off by Lever, and which at any time was but brilliant caricature, has been curiously enough accepted by most of his readers as an accurate representation of life in Ireland. Apart from his powers as a writer, Lever was one of the most brilliant conversationalists and one of the most agreeable companions of his time; a striking personality, he was at home everywhere, knowing everybody, a welcome guest in all societies and in all countries. The only published authority for Lever's life is a poor memoir by Fitzpatrick (1879; new ed. 1896). See also *Saturday Review*, vol. lxxix, p. 743.

Leveret, the young of the hare during the first year of its age.

Leverrier, URBAIN JEAN JOSEPH, a great French astronomer, was born at St Lo, in Normandy, 11th March 1811. He was admitted into the Ecole Polytechnique in 1831, was subsequently employed for some time under the board for the administration of tobacco, and as early as 1836 distinguished himself by his papers on the combinations of phosphorus with hydrogen and oxygen. Next year the place of teacher of astronomy at the Polytechnique was offered him, and in this way Leverrier was led to become an astronomer. His *Tables de Mercure*, and several memoirs on 'the secular inequalities,' opened to him the door of the Academy in 1846. At the instigation of Arago he applied himself to the examination of the disturbances in the motions of the planets, from which the existence of an undiscovered planet could be inferred; and, as the result of his laborious calcula-

tions, directed the attention of astronomers to the point in the heavens where, a few days afterwards, the planet Neptune was actually discovered by Galle at Berlin (see also ADAMS, J. C.). For this Leverrier was rewarded with the Grand Cross of the Legion of Honour, a professorship of astronomy in the Faculty of Sciences at Paris, and various lesser honours. When the revolution of 1848 broke out Leverrier sought distinction as a democratic politician; the department of La Manche chose him in May 1849 to be a member of the Legislative Assembly, where he at once became counter-revolutionary; and in 1852 Louis Napoleon made him a senator. In 1854 Leverrier succeeded Arago as director of the Observatory of Paris, an office which, save during an interval of three years (1870-73), he held till his death, 23d September 1877. See Bertrand's *Eloge* in the *Mém. de l'Acad. des Sciences*.

Levi, the third son of Jacob and Leah (Gen. xxix. 34). He is conspicuous through the part he took with his brother Simeon in the slaughter of the inhabitants of Shechem (Gen. xxxiv.). Jacob pronounced this curse on them both, that they should be scattered among Israel (Gen. xlix. 7). In Egypt the House of Levi had divided itself into three families, those of Gershon, Kohath, and Merari. At the distribution of Palestine no tribal territory was allotted to them, but only forty-eight scattered cities. In the Pentateuch they are set apart as the servants of the sanctuary, but they might not perform any priestly function, the priesthood being reserved for one Levitical family, that of Aaron. The history of the Levites has been matter of controversy. Some have assumed that Levi is simply the eponymous ancestor of the Levitical caste, and unsuccessful efforts have been made to deny that Levi was originally a tribe at all. See Wellhausen's *History of Israel* (1885).

Levi, LEONE, born 6th July 1821 at Ancona, settled in Liverpool in 1844, and in 1852 became professor of the Principles and Practice of Commerce in King's College, London. He died 7th May 1888. Among his works were *Commercial Law of the World* (1850; republished as *International Commercial Law*, 1873); *On Taxation* (1870); *History of British Commerce* (1872); *War and Its Consequences* (1881); *Wages of the Working Classes* (1885); *International Law* (1887).

Leviathan, a term that occurs five times in Scripture, in every case but one (Ps. civ. 26) denoting the crocodile. Some think that in Isa. xxvii. 1 it represents the great python which appears in Egyptian monuments.

Levita, ELIAS, a Jewish grammarian and exegete, was born at Neustadt on the Aisch, near Nuremberg, in 1465. One of the then frequent expulsions of the Jews forced him to seek refuge in Italy, where he held a high position as teacher of Hebrew, first in Venice, next in Padua, finally in Rome (1514). Cardinal Egidio here became his patron and pupil, but even he could not prevent Levita's again being expelled this city, together with his Jewish brethren, in 1527. He then returned to Venice, where he lived for the most part until his death, 1549. His principal exegetical works are on Job, the Psalms, Proverbs, and Amos. Other important works are his *Massoreth Hammassoreth*, a treatise on the vowel-points; a Hebrew grammar; and a Talmudic and Targumic Dictionary. Most of his works have been repeatedly edited and partly translated by Buxtorf, Munster, Fagnus, and others, who owed most of their Hebrew knowledge to Levita exclusively. He is called not only *Halevi*, but *Ashkvausi* ('the German'), *Habachur* ('the master'), &c.

Leviticus. See PENTATEUCH.

Levkosia. See NICOSIA.

Levuka, till 1882 the capital of Fiji (q.v.).

Levnose. See SUGAR.

Levy (Fr. *levée*) is the compulsory raising of a body of troops from any specified class in the community for purposes of general defence or offence when the existing military forces are insufficient to meet the necessities of the case. When a country is in danger of instant invasion a *levée en masse* is sometimes made—i.e. every man capable of bearing arms is required to contribute in person towards the common defence. On less urgent occasions the levy may be restricted to a class, as to men between eighteen and forty years of age.

Lewald, FANNY, German novelist, was born of Jewish parents at Königsberg, on 24th March 1811, but professed Christianity in her seventeenth year. She began to write when about thirty, and from 1840 lived in Berlin; in 1855 she married Adolf Stahr (1805-76), the literary critic. She died at Dresden on 5th August 1889. Fanny Lewald was perhaps the most important woman novelist in Germany during the middle of the 19th century. She was possessed of keen powers of observation, and wrote in a sober, matter-of-fact style, which, however, was not incompatible with a strong undercurrent of restrained feeling. She was an especially enthusiastic champion of the emancipation of her sex. Her realistic tendencies brought her into conflict with the Countess von Hahn-Hahn, whose unreal sentimentalism she successfully parodied in *Diogenes* (1847). Her best book is perhaps *Von Geschlecht zu Geschlecht* (1863-65). An English translation of *Stella* (1884) appeared in the same year. At different times she visited many parts of Europe with her father and her husband; her books on Italy (1847) and Great Britain (1852) were the most valuable outcome of these journeys. See her *Meine Lebensgeschichte* (6 vols., 1861-63).

Lewes, the county town of Sussex, 50 miles S. of London, is picturesquely situated on the eastern declivity of one of the South Downs, at the foot of which flows the navigable river Ouse on its course to the sea at Newhaven, 7 miles distant. Pop. (1801) 4909; (1881) 11,199; (1891) 10,997. The chief objects of interest are the ruins of a priory and castle which once stood here, the former built (1072-78) by William de Warenne, Earl of Surrey, who with his wife Gundreda, a daughter of William the Conqueror, was buried within its precincts. Of the castle which stood on high ground in the centre of the town, the keep and gateway, the only portions now remaining, are occupied by the Sussex Archaeological Society as a museum. Lewes has seven churches, mostly Perpendicular in style, a county hall (1812), free library (1862), school of science and art (1868), and a town hall (1872). The chief trade is in corn, malt, coals, and lime, whilst newspaper printing and tanning are extensively carried on. Till 1867 the town returned two members to parliament, till 1885 one. A charter of incorporation was granted in 1881. Race meetings are held three times a year near Mount Haury on the Downs, where, on the 14th May 1264, a great battle was fought between Henry III. and the insurgent barons under Simon de Montfort. See works by Horsfield (2 vols., 1821-27), Mantell (1846), and Lower (3d ed., 1880).

Lewes, GEORGE HENRY, littérateur, was born in London, a popular comedian's grandson, 18th April 1817. Educated partly at Greenwich under Dr Burney, and partly in Jersey and Brittany, he

left school early to enter first a notary's office, and then the house of a Russian merchant. He next tried walking the hospitals, but could not stand the horrors of the operating-room; so in 1838 he proceeded to Germany, and remained there nearly two years, studying the life, language, and literature of the country. On his return to London he fell to work writing about anything and everything as a Penny Encyclopædist and Morning Chronicle, as a contributor afterwards to a dozen more journals, reviews, and magazines, and as editor of the *Leader* (1851-54), and of the *Fortnightly* (1865-66), which he himself had founded. He 'began life,' says Mr Frederic Harrison, 'as a journalist, a critic, a novelist, a dramatist, a biographer, and an essayist; he closed it as a mathematician, a physicist, a chemist, a biologist, a psychologist, and the author of a system of abstract general philosophy.' The change was rendered possible, Mr Leslie Stephen points out, by George Eliot's literary successes. Lewes was married unhappily and had children, when his connection with her began in July 1854; it ended only with his death at their house in Regent's Park, 30th November 1878. An intellect clear and sharp, if not remarkably strong, a wit lively and piquant, if not very rich, sympathies warm, if not wide, and a style as firm as it is graceful, made Lewes one of the best of critics and biographers; as a populariser of philosophy he was inferior to none, as a populariser of science inferior to very few.

His works, besides a tragedy and a couple of novels (1841-48), include the *Biographical History of Philosophy* (1843; recast in the 3d edition of 1867 as *The History of Philosophy from Thales to Comte*); *The Spanish Drama, Lope de Vega and Calderon* (1846); a *Life of Robespierre* (1848); *Comte's Philosophy of the Sciences* (1853), which is much more than a mere translation; the admirable *Life and Works of Goethe* (1855); *Seaside Studies at Ultramarine* (1858); *Philosophy of Common Life* (1859-60); *Studies in Animal Life* (1862); *Aristotle* (1864); *On Actors and the Art of Acting* (1875); and *Problems of Life and Mind* (1874-79), its five volumes dealing with 'The Foundations of a Creed,' 'The Physical Basis of Mind,' 'The Study of Psychology,' and 'Mind as a Function of the Organism.' See ELIOT (GEORGE), with works there cited, and an article by Anthony Trollope in the *Fortnightly* for January 1879.

Lewis, or SNAKE RIVER, the great southern branch of the Columbia (q.v.). See IDAHO.

Lewis. See LOUIS, and LEWIS-WITH-HARRIS.

Lewis, SIR GEORGE CORNEWALL, statesman and author, was born in London, 21st October 1806, son of Sir T. F. Lewis, Bart., of Harpton Court, Radnorshire, and was educated at Eton and Christ Church, Oxford, where in 1828 he took a first class in classics and a second class in mathematics. A pupil of Austin's, he was called to the bar of the Middle Temple in 1831, and succeeded his father as Poor-law Commissioner in 1839. He sat for Herefordshire from 1847 to 1852, and for the Radnor Boroughs from 1855. After holding minor government offices, he rose rapidly to be financial secretary to the Treasury, Chancellor of the Exchequer under Palmerston (1855-58), Home Secretary (1859-61), and Secretary at War. He succeeded his father as second baronet in 1855, and died 13th April 1863. He was an earnest and sincere politician, and his business capacity, sound sense, varied knowledge, and moral and intellectual qualities made him a notable figure in the public and political life in England.

His extraordinary versatility may be gathered from a list of his works, which include a treatise on the *Origin and Formation of the Romance Language* (1835), *The Fables of Bæmus, The Use and Abuse of Political Terms, The Influence of Authority in Matters of Opinion* (1850),

his famous *Inquiry into the Credibility of Ancient Roman History* (1855—against Niebuhr), *The Method of Observation and Reasoning in Politics, Local Disturbances and the Irish Church Question* (1836), *The Government of Dependencees, Herefordshire Glossary, The Astrology of the Ancients* (1859), and *Dialogue on the Best Form of Government* (1859). He was editor of the *Edinburgh Review* from 1852 to 1855. See his *Letters* (1870), and *Bagehot's Literary Studies* (1879).

Lewis, MATTHIAS GREGORY ('Monk Lewis'), was born in London, 9th July 1775, and educated at Westminster, at Christ Church College, Oxford, and at Weimar, where he was introduced to Goethe. In 1794 he went as an attaché to the Hague, and there, inspired by Glanvill (his mother's favourite author) and the *Mysteries of Udolpho*, wrote at nineteen *Ambrosia, or the Monk* (1795), the gruesome, unclean romance which made him so famous that in 1798 his invitation to dine at an Edinburgh hotel could elate Scott as nothing before or afterwards. A musical drama, *The Castle Spectre* (1796), *The Bravo of Venice* (1804), and a host more of blood-and-thunder plays, novels, and tales are happily forgotten; but two lines at least survive of one of his ballads, *Alonso the Brave*. In 1796 he entered parliament as a silent member, and in 1812 he inherited from his father two large estates in Jamaica. So to better the condition of his slaves there, good-hearted, lachrymose, clever little 'Mat' forsook the society of the Prince Regent, Byron, and all his other great friends, and made the two voyages, in 1815 and 1817, which furnished materials for his one really valuable work, the posthumous *Journal of a West India Proprietor* (1834). On his way home, in the Gulf of Florida, he died of yellow fever, 13th May 1818, and was buried at sea. See his *Life and Correspondence* (2 vols, 1839).

Lewisham, in Kent, 6 miles SSE. of Charing Cross, since 1885 a parliamentary borough, with 67,500 inhabitants.

Lewisia, a genus of plants, of the natural order Portulacaceae (see PURSLANE), named in honour of the American traveller, Meriwether Lewis (1774-1809). *L. rediviva* is found in the regions of his explorations, on the west side of the Rocky Mountains. Its thick, branching roots are gathered and are highly valued by the Indians as nutritive, and also as restorative. It has a showy rose-coloured flower. Another species, *L. brachycalyx*, is found in Utah.

Lewiston, a city of Maine, on the Androscoggin River, 35 miles N. of Portland. The river, which is crossed by several bridges, has here a fall of 50 feet, and the water-power is distributed by a dam and canal to numerous mills and factories. The principal manufactures are woollens and cottons, and these are produced in very large quantities. Lewiston contains a Baptist college. Pop. (1880) 49,983; (1890) 21,701.

Lewis-with-Harris, an island of Scotland, the largest and most northerly of the Outer Hebrides, separated from the mainland by the Minch, and containing the town of Stornoway (q.v.), 43 miles NW. of Poolewe and 180 N. by W. of Oban. Its length is 60 miles; its greatest breadth is 28 miles; and its area is 859 miles, of which 683 belong to Lewis, the Ross-shire portion, in the north, and 176 to Harris, the Inverness-shire portion, in the south. The coasts are wild and rugged, the chief indentations being Broad Bay and Lochs Erisort, Seaforth, Resort, and Roag. The Butt of Lewis, a promontory at the extreme north, rises sheer from the sea to a height of 442 feet. Gneiss is the predominant rock; and the surface, attaining 2662 feet in Harris and 1750 in Lewis, consists mainly of hill, moor, and moss,

treeless and almost shrubless, with much peat and fresh-water lakes innumerable. Less than 4 per cent. of the entire area is in cultivation. In 1844 'the Leys' was purchased for £190,000 from the Mackenzies of Seaforth by Sir James Matheson (1796-1878), who expended £330,000 on improvements. Pop. (1801) 12,164; (1831) 18,410; (1891) 30,726, mostly Gaelic-speaking. See CALLERISH, CROFTERS, HERRIDES; and W. A. Smith's *Louisiana* (1875).

Lexicon. See DICTIONARY.

Lexington. (1) capital of Fayette county, Kentucky, stands in the fertile blue-grass region, at the junction of four railways, 77 miles S. of Cincinnati. It is a handsome city, its principal edifices the court-house, the state university, and the state lunatic asylum. The fine Henry Clay monument also is noteworthy. There are manufactures of spirits, hemp, and, especially, of tobacco. Pop. (1880) 16,656.—(2) A village of Massachusetts, 11 miles WNW. of Boston, where the first blood of the Revolution was shed, April 19, 1775. A monument has been erected in memory of the eight minute-men who fell in this first conflict.—(3) Capital of Lafayette county, Missouri, on the Missouri River, 42 miles by rail (84 by water) E. of Kansas City. It contains Baptist and Methodist ladies' colleges, and has manufactures of hemp and woollen goods. Pop. 3996.—(4) A pretty village of Virginia, on the North River, 32 miles NNW. of Lynchburg, is the terminus of the James River and Kanawha Canal, and contains the Washington and Lee University and the Virginia Military Institute. Here Robert E. Lee and 'Stonewall' Jackson are buried. Pop. 2771.

Lex Talionis, the law of retaliation, common among all ancient and barbarous nations, by which an eye for an eye and a tooth for a tooth was considered the appropriate punishment.

Leyden, or LEIDEN, a town of Holland, stands on the Old Rhine, 5 miles from the North Sea, and by rail 9 miles N. by W. of the Hague and 31 W. of Utrecht. It is a typical Dutch town, spotlessly clean, with canals bordered by avenues of trees, and sleepy squares and streets. Its predominant characteristic is an air of academic repose; and the town is the seat of a celebrated university, which formerly attracted students from all parts of Europe, including Sir Thomas Browne, Evelyn, Boswell, Goldsmith, John Wilkes, Alexander Carlyle, Alexander Monro, and several other distinguished Scottish surgeons, and numbered amongst its professors some of the greatest names in the world of learning: Grotius, Descartes, Salmasius, Scaliger, Boerhaave, Hemsterhuis, Ruinken, Valekenae, &c., besides Arminius and Gomarus, have all either studied or taught at Leyden. It was founded in 1575 by William of Orange as a reward to the citizens (they themselves selecting this boon in preference to a remission of taxes) for their heroic defence against the Spaniards from October 1573 to October 1574. At the present time it is frequented by about 800 students, and has some fifty professors and teachers. Its collateral institutions include a library of 160,000 volumes and 5000 MSS., many of them valuable oriental and Greek MSS.; a botanic garden, which has counted Linnaeus and Boerhaave amongst its directors; a museum of natural history, one of the finest and best arranged in Europe; a museum of antiquities, with especially valuable Egyptian monuments; an ethnographical museum, the nucleus of which was Siebold's Japanese collection; and an observatory. The senate-hall is hung with the portraits of more than a hundred celebrated Leyden professors. The town-art museum contains pictures by Rembrandt, Jan Steen, Gerard Douw,

Lucas of Leyden, the family Mieris—all natives of the town, and others. Here too were born some of the Elzevirs, the celebrated printers, who carried on a branch of their business in Leyden, and John of Leyden, the Anabaptist. The quaint and picturesque town-hall dates from 1574-98. There are nearly a score of churches, the most notable among them being St Peter's, with monuments to Boerhaave, Scaliger, Camper, Arminius, &c., and St Paneras, with a monument to Van der Werf, the hero of the siege. In the centre of the town stands an old round tower, which is said to date from the Roman occupation. Leyden was in the 15th century famous all over Europe for its manufactured cloth, baize, and camlet. The same industries, but to a much less extent, together with the manufacture of cotton, twine, and yarn, the dyeing of cloth and leather, &c., are still carried on. Leyden is the seat of a school of navigation. In 1650 the population numbered 100,000; but a century later it had fallen to three-quarters of that number, and by the beginning of the 19th century to 30,000. In 1876 it was 40,724, and 46,379 in 1889. In 1807 a portion of Leyden was destroyed by the explosion of a barge laden with gunpowder on one of the canals.

Leyden, JOHN, poet and oriental scholar, was born, the son of a shepherd, at the village of Denholm, Roxburghshire, 8th September 1775. In 1790 he entered Edinburgh University, and was licensed as a preacher or 'probationer' of the Church of Scotland in 1798. He proved an ardent and enthusiastic student, with a hunger for knowledge, which led him into studies out of the routine, including many European and oriental languages. His strong native talent and varied gifts and attainments, in spite of his uncouth manners, secured him the attention of some of the most eminent persons of the day, including Constable, Henry Maekenzie, Ritson, the Duchess of Gordon, Lady Charlotte Campbell, and Richard Heber, by whom he was introduced to Scott. He aided the latter in gathering materials for his *Border Minstrelsy*, contributing an article on fairy superstitions, and on one occasion he walked between 40 and 50 miles to procure the words of a ballad which were wanting. He was also a contributor to Lewis's *Tales of Wonder*. His first prose work was *Discoveries and Settlements of Europeans in Northern and Western Africa* (1799). Meanwhile his translations and original poetical contributions to the *Edinburgh Magazine* had attracted attention. For a period of six months (1802) he edited the *Scots Magazine*. Before leaving his native country he had completed his *Scenes of Infancy, descriptive of Terribilitate* (1803). In 1803 he sailed for India as assistant-surgeon on the Madras establishment. After four months' service in Madras general hospital he was appointed surgeon and naturalist to the commission for the survey of Mysore and Travancore (1804). His health gave way, he was five times given up by the physician, but sick or well he continued his acquisition of languages. He resided for a time at Penang; came back to Calcutta (1806); wrote an essay on Hindustani dialects; was appointed professor in the Bengal College, and afterwards judge at Calcutta. Through the influence of Lord Minto he was appointed commissioner of the Court of Requests, then assay master of the mint. Meanwhile he translated the Gospels into five different languages. When the expedition against Java was undertaken Leyden accompanied Lord Minto thither as interpreter; and at Batavia, in the exploration of a musty, unventilated library, which contained many Indian manuscripts, he contracted a fever, of which he died, August 27, 1811.

Leyden's versification is soft and musical, but his ballads with their marvellous melody have

taken a higher place than his longer poems. Next after Scott and Hogg, says Principal Shairp, he has done most to illustrate his native region. His attainments as an orientalist were extraordinary; he had a greater or less acquaintance with at least thirty-four languages or dialects. Lord Cockburn speaks of him as ever in a state of excitement, and ever panting for things unattainable by ordinary mortals. A monument to Leyden has been erected at Denholm (1861). Scott describes him as of middle stature, of athletic build, features well proportioned, lively dark eyes, a clear, somewhat ruddy complexion, and light-brown hair. Leyden's chief literary remains are a preliminary dissertation to an edition of the *Complaynt of Scotland* (1801); an essay on the 'Languages and Literature of the Indo-Chinese Nations,' printed in *Asiatic Researches*, vol. xix.; his *Memoirs of Baber* (q.v.), partly by Erskine (1826); *Malay Annals* (1821). See his *Poetical Remains*, by Morton (1819); *Poems and Ballads*, with reprint of memoir by Scott (1875); and *Poetical Works*, with memoir by T. Brown (1875). See also *J. Constable and his Literary Correspondents* (3 vols. 1873); and *Calcutta Review*, No. 61.

Leyden, LUCAS VAN. See LUCAS.

Leydenburg, or Lydenburg, a town in the Transvaal (pop. 2000), on an elevated plateau, about 180 miles NW. of Delagoa Bay. The district is rich in minerals, and gold has been worked since 1873.

Leyden Jar. See ELECTRICITY.

Leys, HENRI JEAN AUGUSTE, Belgian painter, was born on 18th February 1815 at Antwerp, in which city most of his life was spent, and where he died on 26th August 1869. He was created baron by Leopold I. in 1862. Leys is one of the best modern artists in the style of the old Flemish masters. His most valuable and most characteristic pictures are inspired by the private life and stirring history of his native land—Rembrandt's Studio (1837), 'A Flemish Wedding' (1839), 'Public Worship in Antwerp Cathedral,' 'A Village Fête,' 'A Musical Party' (1846), 'Rubens Feasted by the Gunsmiths of Antwerp' (1851), 'New-year's Day in Flanders,' 'Luther Singing in the Streets of Eisenach' (1862), 'Erasmus in his Study,' 'Institution of the Golden Fleece,' and a series of frescoes in his own dining-room representing the history of a 'Flemish Festival.' The last years of his life were occupied in painting six scenes from the history of Antwerp in the 16th century on the walls of the great hall in the town-house of Antwerp. Alma Tadema studied under Baron Leys. See Sulzberger's *Henri Leys* (Brus. 1885).

Leze Majesty (Norman Fr.; Lat. *lesa majestas*), an offence against sovereign power. See TREASON.

Lhassa ('the Seat of the Gods'), the capital of Tibet and sacred city of the Lamaist Buddhists, is situated in a fertile plain, 11,910 feet above the sea, and surrounded by mountains ranging from 2000 to 1000 above that altitude. The city stands in 29° 30' N. lat. and 90° 57' E. long., about 45 miles NE. of the junction of the Ki-chu with the Yaro San-po; the former river flows past the city westwards about a mile to the south. The city proper is surrounded with a wall, and consists of a closely packed assemblage of good stone and brick houses and shops, with ecclesiastical buildings, chiefly temples, sandwiched in between. Outside this central city lie extensive suburbs, the houses standing in gardens, ranged on each side of broad, tree-shaded streets. The monasteries, some fifteen in number, are scattered over the plain and in the suburbs. Just outside the central city on the northwest stands a conical hill, Potala, which is thickly encrusted with palaces and temples,

their roofs all gilded: this is the abode of the Grand Lama (see LAMAISM). If Potala is the Vatican of the Buddhists, they have their St Peter's in the temple of Labrang or Cho-khang, which overlooks the great square in the very heart of the city. The most sacred of its shrines contains a life-size image of Buddha and images of several other notabilities of the Buddhist faith. Near the north end of the city stand two famous temples, known as Ramo-Chih and Morn, the monks of which practise sorcery and magic, and grant degrees in the same. The most celebrated of the monasteries are perhaps those known as the Four Ling, from the heads of which the regent of Tibet is always chosen: Chiakpori, the medical university; Dai-pung, the school of Buddhist philosophy; and the Galdan Lamaserai (25 miles N.E. of the city), the abbot of which is one of the highest dignitaries in the Buddhist church. But Lhasa is something more than the ecclesiastical and religious centre of the Buddhist faith; it is an important trading centre, a terminus for caravans to and from India, Cashmere, Burma, China, Mongolia, and Turkestan. The principal article of commerce is tea; next to this come silks, carpets, rice, tobacco, horses, sheep, mink, European and Indian manufactured goods, &c. There is an important colony of Kashmiris, who, though Mohammedans, are tolerated because of their usefulness as traders. The resident population, exclusive of the garrison and the monks, is about 15,000. The number of inmates in the individual monasteries ranges from 3000 to 7000, or even more. The Chinese maintain a small garrison (some 500 men); and the Chinese emperor is represented by two resident officials, who, though they do not sit on the supreme council of the Grand Lama (who is also the civil ruler of Tibet), exercise considerable influence on the government indirectly. The resident population is, however, generally augmented by a floating population of pilgrims and traders, in numbers varying from 40,000 to 80,000. The women of Lhasa go about with perfect freedom; they stain their faces with black spots. Tibet became tributary to China about 1720, and has never since shaken off the yoke. Owing to the jealous exclusiveness of the Tibetan and Chinese authorities, and the close watch they keep all along the frontiers, it is believed that only three Europeans have entered Lhasa during the 19th century, namely the Englishman Manning (in 1811-12) and the Frenchmen Huc and Gabet (1846), though several Europeans reached the city in previous centuries. But since about 1866 specially trained Indian explorers have from time to time been sent into Tibet by the Calcutta authorities; to them we owe most of our newer information about that strange country.

See Huc's *Travels in Tartary, Tibet, &c.* (2 vols. 1844); *Narrative of the Mission of G. Beale and of the Journey of T. Manning to Lhasa*, edited by C. Markham (1876); 'Explorations by A — k in Tibet,' in *Proc. Roy. Geog. Soc.* (1885); and papers by G. Sandberg, in *Nineteenth Century* (October 1889) and *Contemp. Review* (July 1890).

Lherzolite, an igneous rock consisting of a granular or fine-grained aggregate of olivine, pyroxene, enstatite, and peridot. It derives its name from Lake Lherz in the Pyrenees.

L'Hôpital, MICHEL DE, French statesman, was born at Aigueperse in Auvergne in 1504, studied law at Toulouse and Padua, and settled as an advocate in Paris when about thirty years of age. In 1547-48 he represented Henry II. at the Council of Trent; then for some years he held high office in the household of Margaret of Valois, Duchess of Berry. His appointment in 1554 as superintendent of finances was but the preliminary to his nomination as chancellor of France six years later. His

policy was one of moderation; especially did he endeavour to assuage the fierce rancour of the religious quarrel by staying the hand of the Catholic persecutors, by resisting the introduction of the Inquisition, and by promoting such conferences, &c. as that of Poissy. But after the peace of Amboise (1563) he lost ground with Catharine de' Medici, and in 1568 he resigned the chancellorship. He spent the rest of his life in retirement on his estate of Vignay near Etampes, and died there (or at Belesbat) on 13th March 1573. His Latin poems, speeches, memoirs, &c. were published in 5 vols. in 1824-25. See *Life by Villemain* (new ed. 1874) and monographs by Taillandier (1861) and Dupré-Lasale (1875).

Liability (Limited) Acts. See COMPANY.

Liability of Employers. An employer is in law responsible for reparation of wrongs or injuries done to strangers by his servants while they are acting within the course and scope of their service. But where a master has forbidden the doing of the thing from which damage arises, or where a servant wilfully or maliciously does an injurious act to serve his own private ends, the master will not be liable. The Employer's Liability Act of 1880 so far extended the favour of the law to workmen as to make employers answerable to their servants for the negligence of those to whom they have delegated their authority. It gave, in certain cases of injury specified in the act, the same right of reparation to workmen against their employers as is enjoyed by strangers. But it was limited in its scope, and did not apply to servants not engaged in manual labour; nor was any provision made against employers and workmen contracting themselves out of the act. The Workmen's Compensation Act of 1897 still further extended the liability of employers by making them liable to their workmen for all injuries arising out of their employment from whatever cause, except their own wilful misconduct. 'Negligence' is not necessary to create liability, and even where the greatest care is taken the employer is still liable, as he is also to workmen employed by a sub-contractor. Any scheme of 'contracting out' of the act must be certified by the Registrar of Friendly Societies to be as favourable to the workmen as the act itself. The act was originally limited to certain specified industries, but practically included all workmen except agricultural labourers, seamen, and domestic servants; and the amending act of 1900 extended its application to agricultural labourers in the widest sense of the term. The amount of compensation is as follows: when a workman is killed, leaving dependents, a sum from £150 to £300; when no dependents are left, a sum not exceeding £10 for medical and funeral expenses; when total or partial disablement results, a weekly payment not exceeding £1. The liability thus imposed has been met by various forms of insurance, mainly supplied by accident insurance companies. See DAMAGES; and MASTER AND SERVANT.

Lia Fail. See CORONATION.

Liakhov Islands. See NEW SIBERIA.

Lianas, a term first used in the French colonies, in the form *lianes* (from *lier*, to bind), for the woody, climbing, and twining plants which abound in tropical forests. Such plants are comparatively rare in colder climates, although the honeysuckles and some species of Clematis afford familiar examples of them; but the lianas of tropical countries overtop the tallest trees, descend again to the ground in vast festoons, pass from one tree to another, and bind the whole forest together in a maze of living network, and often by cables as thick as those of a man-of-war. Many parts of the forest, as in the alluvial regions of the Amazons

and Orinoco, thus become impenetrable without the aid of the hatchet, and the beasts which inhabit them either pass through narrow covered paths, kept open by continual use, or from bough to bough far above the ground. Many lianas—as some of the species of *Wrightia*—become tree-like in the thickness of their stems, and often kill by constriction the trees which originally supported them; and when these have decayed the convolutions of the lianas exhibit a wonderful mass of confusion magnificent in the luxuriance of foliage and flowers. No tropical flowers excel in splendour those of some lianas. Among them are found also some valuable medicinal plants, as sarsaparilla (*Smilax*, order Liliaceæ). The rattans (*Calamus*, order Palmaceæ) and vanilla (order Orchidaceæ) are lianas. Botanically considered, lianas belong to orders which are often quite different. Tropical plants of this description are seldom seen in our hot-houses owing to the difficulty of their cultivation.

Lias. The lias is the lowest division of the Jurassic System (q.v.). The beds composing it may be considered as the argillaceous basis of that series of rocks, consisting of more than a thousand feet of alternations of clay and limestone, with but a few unimportant deposits of sand. It consists of the following groups: Upper Lias (400 feet), Marlstone (200), Lower Lias (900).

The Upper Lias consists of thin limestone beds scattered through a great thickness of blue clay, more or less indurated, and so aluminous that it has been wrought for alum at Whitby. Above this clay come sandy deposits. The Marlstone is an arenaceous deposit, bound together either by a calcareous or ferruginous cement, in the one case passing into a coarse shelly limestone, and in the other into an ironstone, which has been extensively wrought both in the north and south of England. The Lower Lias beds consist of an extensive thickness of blue clays, intermingled with layers of argillaceous limestone. In weathering, the thin beds of blue or gray limestone become light brown; while the inter-stratified shales retain their dark colour, giving the quarries of this rock at a distance a striped or ribbon-like appearance, whence it is supposed the miner's name lias or layers is derived.

The Lias is highly fossiliferous, the contained organisms being well preserved; the fishes are often so perfect as to exhibit the complete form of the animal, with the fins and scales in their natural position. Numerous remains of plants occur in the lignite and in the shales. The name Gryphite Limestone has been given to the Lias, from the great quantities of *Gryphaa uncinata*, a kind of oyster, found in it. Fish remains are frequently met with; the reptiles, however, are the most striking forms. They are remarkable for the great numbers in which they occur, for the size which many of the species attain, and for the adaptations in their structure which fitted them to live in water. The most noteworthy are species of *Ichthyosaurus* and *Plesiosaurus* (q.v.).

The Liassic rocks extend in a belt of varying breadth across England, from Whitby, on the coast of Yorkshire, south to Leicester, then south-west by Gloucester to Lyme Regis in Dorsetshire.

Libanius, a Greek sophist or rhetorician, was born at Antioch, in Syria, about 314 A.D. He studied at Athens, and began to teach there so successfully that he soon moved to Constantinople. There his lectures were so attractive that he emptied the benches of the other teachers of rhetoric, who had him expelled from the city on a charge of 'magic.' He then proceeded to Nicomedia; but after five years returned to Constan-

tinople. Ultimately, in 354, he settled down in his native city, where he died about 393. Libanius was the instructor of St Chrysostom and St Basil, who always remained his friends, though Libanius was himself a pagan, and a great friend of the Emperor Julian. His works, which are mostly extant, consist of orations, declamations, letters, &c. The most complete edition of the orations and declamations is that by Reiske (4 vols. 1791-97), and of the letters that by J. C. Wolf (1738). See Lives by Petit (Paris, 1866) and Sievers (Berlin, 1868).

Libanon. See LEBANON.

Libation (Lat. *libare*, 'to pour out'), literally, anything poured out before the gods as an act of homage or worship; a drink-offering. The term was often extended in signification, however, to the whole offering of which this formed a part, and in which not only a little wine was poured upon the altar, but a small cake was laid upon it. This custom prevailed even in the houses of the Romans, who at their meals made an offering to the Lares in the fire which burned upon the hearth. The libation was thus a sort of heathen 'grace before meat.' Even so late as the last quarter of the 19th century Mr Bent found at Samos the *spondi* or libation poured out on the floor before drinking.

Libau, a seaport of Comland, Russia, on the Baltic, by rail 146 miles W. by S. of Riga. It possesses a fine harbour, admitting vessels that draw 17 and 18 feet, and free from ice except for less than a fortnight in the year. Its importance as a point of export has greatly increased of late years. Its exports, consisting of grain, linseed and linseed oil-cake, petroleum, eggs, spirits, flax, hemp, &c., have an annual value of £3,000,000 or more (British trade constituting a fourth); its imports, chiefly coals, herrings, artificial manures, cotton, dyewood, and iron, under £2,000,000 (British trade nearly half of that). In 1890-95 the Russian government spent £2,500,000 on constructing a first class naval and commercial harbour. There already existed shipbuilding-yards and a school of navigation. The industries include iron-founding, brewing, oil-pressing, &c. Libau is much frequented as a seaside resort. One of the churches contains an organ (1886), one of the largest in the world. Pop. (1874) 10,767; (1880) 27,418; (1895) 39,000, mostly of German nationality.

Libel is any publication by printing, writing, painting, or the like signs, tending to injure the reputation of any one or expose him to hatred or contempt. A blasphemous, treasonable, or seditious publication is also termed a libel. Slander (q.v.), on the other hand, is defamatory spoken matter. An action for libel will lie though it cannot be shown that any appreciable pecuniary loss or damage has resulted from the publication; such loss or damage is an inference of law when the writing, &c. either is obviously defamatory or was so in the circumstances. Any definite loss is called special damage, and if properly brought before the court is taken into account when compensation is awarded.

In England the libelled party may seek redress civilly or criminally. If civilly he must prove that the matter was published of him falsely and maliciously, for the truth of the alleged libel (*justification*) is an absolute defence to a civil action. The defendant, besides repelling these pleas, may also bring forward some special defences. Thus, he may allege privilege, which is either *qualified* or *absolute*. Qualified privilege arises where matters of private interest are concerned. So a communication between employers as to the character of a servant is, if made in good faith and without express malice, protected. Absolute privilege arises where

the administration of justice or affairs relating to the public service are involved. Thus, statements in a judicial affidavit, or in a report properly made by an officer to his superior cannot afford a cause of action (see CONFIDENTIALITY). The Statute of Limitations also provides that actions for libel must be commenced within six years of the occurrence of the act complained of. Criminally, the remedy for a libel is by indictment (usually after proceedings before a magistrate), or (though more rarely) by criminal information. This last is either filed by the Attorney-general himself, in which case it is called an *ex officio* information, or by the queen's coroner and attorney by the direction of the Queen's Bench Division on the application of some private individual. An *ex officio* information is usually for a libel that seems to threaten some danger to the state; in the other kind of criminal information, as the alleged offence is against a private person, it must be shown that the ordinary remedy is inapplicable.

The net, so to speak, of the criminal law is much more comprehensive than that of the civil law. Thus, a prisoner may be prosecuted for libelling a dead person, if an attempt to bring contempt and scandal on the deceased's relatives can be proved; the libel need not have been published to a third party; it may have been directed against a company or sect, and not against any particular individual; it may be quite true, but unless its publication was for the public advantage (even this limited defence was only introduced by Lord Campbell's Act of 1843) this is no answer. In all these cases the civil law affords no remedy. Previous to 1792 the judges took upon themselves to decide whether the matter was libellous or no, leaving merely to the jury the question of publication; but in that year Fox's Act declared and enacted that the jury should have power to 'give a general verdict of guilty or not guilty upon the whole matter put in issue upon the indictment or information.' Besides the common law various statutes make libels against private persons, and also seditious and blasphemous libels, punishable by fine or imprisonment. But prosecutions for the last kind, except under very special circumstances, are not at the present day of probable occurrence. 'If,' said Lord Coleridge, in the modern case (1883) of the Queen *v.* Ramsay and Foote, 'the decencies of controversy are observed, even the fundamentals of religion may be attacked without a person being guilty of blasphemous libel.' Though this dictum has been questioned, it may safely be taken as a correct exposition of the present state of the matter. See BLASPHEMY, SEDITION.

The law of libel as it affects newspapers requires some special notice. Under Lord Campbell's Libel Act of 1843 the defendant in any action for libel contained in a public newspaper may plead absence of gross negligence and malice, and that he published an apology at the earliest moment possible. He is also at liberty, on filing such plea, to pay into court a sum of money by way of amends. The Newspaper Libel and Registration Act, 1881, as amended by the Law of Libel Amendment Act, 1888, provides that fair reports of proceedings at public meetings and in the law-courts shall be privileged; that actions against various defendants for libels practically the same may be consolidated; that before criminal proceedings are taken against persons connected with a newspaper for a libel therein the leave of a judge at chambers must be obtained; that defendants in libel actions and their wives are competent, though not compellable, witnesses; that in proceedings before magistrates matters of justification may be gone into, and that there may be a summary conviction followed by a fine not exceeding £50 for libels of a trivial char-

acter. In Scotland the law of libel is different in some important respects from that of England. The chief points are: (1) there is no radical distinction between libel and slander, both are equally defamatory; (2) damages are awarded as a solatium for wounded feelings; (3) libel and slander are actionable, though not what is technically termed in England *published* i.e. communicated to a third person; (4) reports of public meetings are more protected by the common law of Scotland than by the common law of England, though the exact limit has not been judicially settled; (5) the Scotch system of public prosecution renders criminal charges for libels on individuals extremely rare.

In the United States the law of libel follows the common law of England, except that the so-called Seditious Law (1798) expired in 1801, and has never been renewed, and that, generally speaking, it is a valid defence, whether in civil or criminal prosecutions, to show that the matter complained of was true and was published for justifiable ends. Privilege, however, is much further extended than in England.

Libel has several special legal meanings. In the English spiritual courts it is 'a declaration or charge drawn up in writing on the part of the plaintiff which the defendant is obliged to answer.' In the civil and criminal courts of Scotland it is the form into which the complaint against the defender or panel is put. It is also the name for the written charge against an accused person in a church court in Scotland.

The leading English text-book on libel is Odgers (2d ed. 1887; supplement, 1890). Earlier treatises by Starkie and Folkard are now out of date. Fraser's *Law of Libel in its relation to the Press* (1889), and Shortt's *Law relating to works of Literature and Art* (2d ed. 1884) are useful for reference. In Scotland the special treatise by Borthwick (1826) is antiquated; the last editions of Erskine & Bell supply the best information. Guthrie Smith's *Law of Damages* (2d ed. 1889) may also be consulted.

Libellula. See DRAGON-FLY.

Libel. See BAST.

Liberals. See WHIGS.

Liberia, a Negro republic on the Pepper Coast (Guinea) of West Africa, extending north and east of Cape Palmas. The coast-line measures about 500 miles. The boundaries in the interior are not determined, but the republic is considered to extend inland for a distance of 200 miles. The coast-region consists of mangrove swamps, lying behind a belt of sand dunes, is traversed by numerous rivers, and interrupted by projecting headlands of rock. About 20 miles or so inland the surface begins to rise into undulating uplands. The climate and vegetation are tropical. The temperature is pretty even, scarcely ever less than 75° F. or more than 88° F. The rainy season lasts about seven and the dry season five months. The soil is well adapted for the cultivation of coffee, the principal crop grown after the food-plants rice and manioc. The more important articles of export are coffee, sugar, palm-oil and palm-kernels, cocoa, arrowroot, caoutchouc, ivory, kola nuts, &c. The total value of the trade does not probably much exceed half a million sterling. The population amounts to 1,068,000, of whom 18,000 are liberated American slaves and their descendants, the remainder indigenous Negroes, including the Kroomen (q.v.). Capital, Monrovia (pop. 3000), now greatly decayed. Liberia owes its origin to the American Colonising Society, which in 1821 bought land on this coast and settled a small body of freed African slaves. The colony grew and prospered; new-comers arrived in large numbers from the United States, and fresh lands

continued to be bought. In 1847 the free and independent republic of Liberia was constituted; and it has enlarged its boundaries at least four times since then, being joined ten years later by the Negro republic Maryland (founded as a colony in 1821, as a republic in 1854), to the east of Cape Palmas. The constitution of Liberia is modelled on that of the United States: there are a president and House of Representatives (13 members), elected for two years, and a Senate (8 members), elected for four years. No white man is allowed to acquire citizen's rights or to hold property. There is no standing army, but all citizens capable of bearing arms are enrolled in the militia. Slavery is declared illegal. Complete religious toleration exists, the Methodist forms prevailing. The state debt amounts to £100,000, but no interest has ever been paid since the loan was made in 1871. English money is current, though accounts are kept in dollars and cents; and English weights and measures prevail. The republic does not enjoy much favour in the eyes of the native Negroes, nor yet of those in the United States, although a few immigrants still continue to arrive from year to year. Not only have the Liberians failed to make any impression on the aboriginal inhabitants, the people they were sent to civilise, but they themselves are relapsing in many respects towards barbarism: they are lazy and quarrelsome, and ape the worse manners of the whites, though there are some honourable exceptions.

See Buttikofer, *Reisbilder aus Liberia* (2 vols. Leyden, 1890); Bourzeix, *La République de Libéria* (Paris, 1887); and Wauwermans, *Libéria* (Brussels, 1885).

Liberius, a native of Rome, succeeded to the see of his native city in 352, on the death of Pope Julius I. For refusing to confirm the decree which condemned Athanasius he was in 355 banished to Thrace by the Emperor Constantius. But three years later he returned to Rome, expelled his rival, Felix II., and re-seated himself on the papal throne. He died on 24th September 366. See **ARIUS**, and **ATHANASIUS**.

Liberty, Equality, Fraternity (*Liberté, Égalité, Fraternité*), the motto of the French Republic, dates from the time of the first revolution. Equality, it should be noted, merely means equality before the law and the absence of class privileges. The motto gives title to a work by Sir J. F. Stephen (1873). For the Cap of Liberty, see **BONNET**. The custom of planting trees of liberty, crowned with a *bonnet rouge*, became common during the Revolution.

Liberty of the Press. See **PRESS**.

Libidibi. See **DIVIDIBI**.

Libourne, a town in the French department of Gironde, at the confluence of the Isle with the tidal Dordogne, 22 miles by rail N.E. of Bordeaux. It is one of the ancient free towns founded by the English, about 1269. Woollens and military clothing are manufactured. Pop. (1872) 12,713; (1891) 14,215.

Libra, the seventh sign of the Zodiac (q.v.).

Library. As soon as men were so far advanced in civilisation as to commit their thoughts to writing in any portable form, whether on papyrus, bricks, parchment, or paper, there were books and consequently libraries. The first of such libraries would probably be the collection of sacred books belonging to the temples of the gods, and under the care of priests. The archives of the state would also be gathered together in the palaces of princes accessible only to a privileged few. But public libraries in the modern sense of the term instituted for the purposes of research in all branches of knowledge—have existed in the most remote

antiquity. As early as 3800 years B.C., according to Professor Sayce, Sargon I., the Semitic ruler of Accad, founded such a library in that city. Here was deposited the great work of Babylonian astronomy, *The Observations of Bel*, which in later acrostichs has come down to our day. The name of the keeper of Sargon's library, Duni sarru, the most ancient librarian on record, is preserved to us on his seal, which is still extant. Libraries of a similar kind were formed in all the chief cities of Babylonia. Their contents, or copies and translations made from them, were finally gathered together to enrich the more famous Assyrian library established in the palace of Koyunjik at Nineveh by Assurbanipal. This great library was rich in history, astronomy, grammar, sacred hymns, and legends, and the science of divination and demonology. The books were on brick tablets, papyrus, and leather. The number of tablets is estimated by M. Menant at about 10,000, making some 500 of our modern volumes of 500 pages in 4to. The greater portion of these tablets, as is well known, have been recovered and deposited in the British Museum. The library of Assurbanipal was intended for the public good. In a note appended to a grammatical treatise the king says: 'I have written it upon tablets . . . I have placed it in my palace for the instruction of my subjects.' The books were methodically arranged and numbered, and the reader requiring a volume handed to the librarian a ticket inscribed with the requisite number.

In ancient Egypt there was an immense literature, and Diodorus Siculus describes the library of King Osymandyas, identified with Rameses I., as having over its door the inscription, 'Dispensary of the Soul.' At a later period the Ptolemies of Egypt vied with the kings of Pergamus in forming magnificent collections. An account of those established in Alexandria has already been given (see **ALEXANDRIAN LIBRARY**). Of the libraries in Greece we know very little. Pisistratus is the most ancient collector named by Greek historians, and Aristotle, who left behind him a large library, is said to have inspired the sovereigns of Egypt with the taste for collecting.

It is characteristic of ancient Rome that the first great libraries of the city should have been formed of the spoils of war. Æmilius Paulus brought to Rome about 168 B.C. the library of the king of Macedonia. Lucullus formed a large collection of books which he liberally threw open to all scholars; but the first public library, properly so called, appears to have been that established by Asinius Pollio, 39 B.C., which he appropriately placed in the temple of Liberty. Julius Caesar intended to erect a public library, but left his design to be carried out by Augustus, who founded two, the Octavian and the Palatine. Other emperors were zealous in adding to the number. The chief of these was the Ulpian Library, instituted by Trajan. At Byzantium Constantine began to collect the Christian books which had escaped the destructive inquisition of Diocletian.

After the irruption of the barbarians the work of building up libraries had to be begun *de novo*. The ravages of fire and war had substantially destroyed the ancient collections. The classical literature was naturally neglected by the Christians, whose own literature had suffered largely from the hostility of the pagans. But the germs of our modern libraries were laid in the cloister. The monks of the order of St Benedict especially were the collectors, translators, and bookmakers of the early middle ages. England may be said in this matter to have led the way. The monasteries of Canterbury, York, Croyland, Whitby, and Durham were at an early date possessed of good libraries. Alenin, when at

Tours, urged Charlemagne, who was zealous in the restoration of learning, to send into Britain for books. Among the more famous libraries abroad may be mentioned those of the monastic communities at Fulda, Corvei, and St Gall in Germany, Monte Cassino in Italy, Fleury and Clugny in France. The books here stored were naturally in large part theological, though the Latin classics were not neglected. A good idea of the contents of such libraries may be gathered from the catalogue of Christ Church, Canterbury, and some other similar lists printed by Edwards in his *Memoirs of Libraries*. It is said that no less than 600 catalogues of monastic collections are preserved in the library of Munich.

The period of decline in monastic learning in Europe generally coincided with the revival of classical studies and of secular literature; and the collecting of books once more became the honourable ambition of princes and private persons. Italy was in this respect especially distinguished. Coluccio, chancellor of Florence, himself a great collector, wrote a treatise urging the establishment of public libraries. Niccolo Nicoli at his death in 1436 bequeathed his library for public use. Following these examples Lorenzo de' Medici formed a magnificent library. Frederick, Duke of Urbino, did the same; and Corvinus, king of Hungary, left at his death in 1490 a collection of 50,000 volumes. Among private collectors, at an earlier date in Great Britain, Richard Aungerville (q.v.), Bishop of Durham, must not be omitted, nor Guy de Beauchamp, Earl of Warwick, who in 1315 bequeathed a collection, chiefly of romances, to Bodlesly Abbey, Worcestershire.

Britain was, however, but slightly touched with the spirit of the literary revival which elsewhere led to the zealous gathering together of the relics of antiquity. The destruction of monasteries and the prejudices of the Reformers led rather to a reckless destruction of books, and the 16th century was a dark age in the library history of the nation. Henry VII. had possessed a collection of three or four hundred choice volumes. Henry VIII., while he was disbursing nearly £11,000 on jewellery, was content to spend £124 on books and binding. Edward VI. did something, Mary and Elizabeth very little, towards increasing the royal library. Archbishop Parker and others made a great effort to induce Queen Elizabeth to form a public library after the pattern 'set us by the more civilised nations, as Germany, Italy, and France,' but without success. The want of a national library continued to be felt for another century and a half. In the reign of William III. the writer of a pamphlet, said to be Richard Bentley, then keeper of the royal library, describes it as having been in a flourishing condition in the time of James I., and since 'fallen into decay to the great dishonour of the crown and the whole nation.' He proposes that there should be a new royal library erected and supported by a yearly revenue settled on it by parliament. The proposal was not carried out, but in 1759 George II. incorporated the library, then containing about 12,000 volumes, with the recently-founded collection of the British Museum (q.v.).

Meanwhile, during the 17th century, many important collegiate and local libraries were founded throughout the kingdom. Sir Thomas Bodley founded the great library which bears his name at the Oxford University in 1602; and while he was ransacking the London bookstalls for his purpose he encountered Archbishop Ussher, who was bent on the same errand on behalf of the newly-established library of Trinity College, Dublin (1601). The Bodleian Library contains over 400,000 printed volumes and 30,000 MSS. The university of Edinburgh, a little later (1627), received a

valuable accession to its collection from Drummond of Hawthornden, and at the close of the century (1682) the Faculty of Advocates entrusted to Sir George Mackenzie the task of building up their library. The university library of Cambridge had been founded in the 15th century, but received a considerable addition by a benefaction of George I. It is now estimated to contain more than 200,000 volumes. In London Archbishop Bameroft founded the Lambeth Library in 1610; and Sion College, a guild of the clergy of London and its suburbs, founded a library in 1629. Good libraries were also established in some of the English towns—Leicester, Norwich, Bristol, and notably Manchester, where Humphrey Chetham in 1653 founded for public use a library which at one time was larger than any out of London and the two university cities. The minor libraries of the several colleges of the universities, and of the Inns of Court, also deserve mention, for, though not always large in number of volumes, they often contain valuable collections on special subjects, manuscripts, rare printed books, and incunabula.

All these libraries, as a rule, possessed little or no endowments, and depended largely for their growth upon private donations. Bodley, however, obtained from the Stationers' Hall in 1610 a grant of all books there entered. By an act of parliament, 14 Chas. II. chap. 33 (1662), printers were ordered to present copies of such books to both universities and the royal library. The Copyright Act of 8 Anne, chap. 20 (1710) required nine copies to be provided for the royal library, then at St James's, the two English universities, the four Scottish universities, the Faculty of Advocates, Edinburgh, and Sion College, London. The privilege attached to the royal library passed with the gift of its books to the British Museum. After the legislative union with Ireland it was extended (41 Geo. III. chap. 107) to the libraries of Trinity College, and the King's Inn, Dublin—thus making in all a tax upon publishers of eleven copies. The number was, however, in 1835 reduced to five; and a yearly grant in compensation was made to the other six libraries, based on a calculation of the average value of the books received by them through the copyright tax during the three preceding years. From this grant Edinburgh University receives £575; Glasgow, £707; St Andrews, £630; Aberdeen, £320; King's Inn, Dublin, £435; and Sion College, £363.

About the middle of the 18th century we hear of the first circulating library established in London. One was opened in Birmingham by Hutton in 1757. About the same time a proprietary library made its appearance in Liverpool. The Leeds library, in the establishment of which Dr Priestley took a prominent part, dates from 1768. It now contains about 80,000 volumes. Great Britain still remained in the early years of the 19th century far behind the rest of Europe in the number and value as well as the accessibility of its libraries. More than three hundred years ago Bishop Bale lamented that there was not in each county at least one library 'for the preservation of noble works, and preferment of good learning.' In the next century John Evelyn declared that Paris alone was able to show more libraries than all the three nations of Great Britain; and, even after the foundation of the British Museum, Gibbon was so little contented with its abundance that he recorded his opinion that 'the greatest city in the world is still destitute of a public library.' But in the middle of the 19th century interest in the subject was awakened, and a great movement took place in the direction of extending and popularising libraries. While a royal commission was enquiring into the management of the British Museum, in 1849 a select committee, on the

motion of William Ewart, M.P. for Dumfries, was appointed by the House of Commons to report on the best means of 'extending the establishment of libraries freely open to the public, especially in large towns in Great Britain and Ireland.' Before this committee was laid a map of Europe (printed in the report) exhibiting by various shades the relative provision of books, in libraries publicly accessible, as compared with the population of the several countries. On this map the smaller German states are represented by the lightest lines, indicating the richest supply, and Great Britain with the darkest shade or poorest provision. The statistics furnished in illustration showed that in Saxony for every hundred inhabitants there were 47 books; in Denmark, 412; in Bavaria, 359; in Tuscany, 261; in Prussia, 200; in Austria, 167; in France, 129; in Belgium, 95; while in Great Britain there were only 53 books to every hundred inhabitants. It may be remarked that in 1850 the British Museum in point of magnitude stood fourth in the list of European libraries. It now holds the second place. The following table shows the increase of the European libraries at that time containing over 400,000 volumes in the course of the next thirty-one years:

	1850.	1881.
Paris, National Library.....	524,000	1,257,000
Munich, Royal Library.....	600,000	1,026,000
St. Petersburg, Imperial Library.....	446,000	1,026,000
London, British Museum.....	435,000	1,550,000
Copenhagen, Royal Library.....	412,000	490,000
Berlin, Royal Library.....	410,000	766,000

Mr Ewart's bill, giving power to certain districts to establish free libraries and to tax the inhabitants for that purpose, passed into law in 1850, and has since been supplemented, amended, and extended to Ireland and Scotland by the acts of 1855, 1866, 1871, 1877, 1884, 1887, and 1889. It is applicable to any borough, district, or parish, whatever the amount of population; a meeting of the rate-payers may be obtained by the requisition of ten of their number addressed to the town-council or other local board, and the adoption of the act is decided by a majority of those present at the meeting, or, if the local authorities prefer it, the will of the majority may be obtained by the issue of voting papers, instead of the convening of a public meeting. All such libraries are to be open to the public free of charge. Some of the larger towns at once took advantage of the act. Manchester led the way in 1852. The libraries of Liverpool and Birmingham were opened in 1860. Each of these libraries now contains more than 100,000 volumes. Yet the movement did not become general for many years. In 1868 there were only fourteen libraries established under the acts. Ten years later the number had increased to eighty-one. A complete list of places where the acts have been adopted, with the dates of their adoption, furnished by Mr Greenwood in his 'Public Libraries,' brings the number in June 1890 up to 208. Before 1886 there were only two parishes in London provided with free libraries. In 1890 there were twenty-one established within the boundaries of the metropolis.

The English act was extended to Scotland in 1854, and the first town to profit by it was Airdrie. The free library of Dundee was founded in 1866, and has 70,000 volumes, spending annually £1000. Edinburgh was comparatively rich in libraries belonging to professional bodies and learned societies, and was slow to adopt the acts. There is in Edinburgh or elsewhere in Scotland no national library supported by the exchequer as in Ireland; but the Advocates' Library, now counting 320,000 volumes, being liberally thrown open to all students, served many of the purposes of such a library; and the Signet Library, a general collec-

tion as well as a legal library (82,000 vols. in all), founded and maintained by the Society of Writers to H.M. Signet, was easy of access to strangers. The university library contains 180,000 volumes. In 1886, however, the city was persuaded by the munificent donation of Mr Andrew Carnegie to establish the Free Public Library, which was opened with 50,000 volumes in June 1890. Glasgow is still without a library under the acts, but the deficiency is in small part supplied by the Mitchell Library, founded by a bequest of the late Stephen Mitchell, and opened in 1877. This library, which has rapidly grown and is specially rich in local literature and Scottish poetry, now contains over 80,000 volumes. It is open to all persons over fourteen years of age.

In Dublin the library of Trinity College retains the copyright privilege, and has 223,000 volumes. The King's Inn library, founded in 1787, which, as has been said, had the copyright tax commuted for an annual sum, is comparatively small (60,000), and restricted to members of the legal profession. The National Library of Ireland, established in Dublin in 1877, and transferred to a new building in 1890, was formed in part by the collection of the Royal Dublin Society, and now numbers 100,000 volumes. It was placed under the Science and Art Department of South Kensington, and is in receipt of an annual grant of £1000 for the purchase of books.

France is remarkable for the number and excellence of its provincial libraries open to the public, while its capital is better provided than any other city in Europe. The Bibliothèque Nationale, which is the largest in the world, is of ancient origin, and contains the collections of many French kings. Its modern history may be said to date from the librarianship of De Thou. In 1617 it obtained the right of two copies of every book published in the kingdom, and at the end of the century it was thrown open to the public. At the beginning of the 19th century it contained 250,000 printed books, 83,000 MSS., and 1,500,000 engravings. The Revolution enriched it with many forfeited collections of private persons and religious communities; and Napoleon augmented the government grant for purchases. The number of its volumes is now well over three million. Fourteen other libraries, most of which are open to the public, and to all of which access can be obtained without difficulty, add about 1,200,000 to the number of volumes available to the Parisian reader. There are, moreover, a number of municipal libraries in the city. The most notable provincial libraries, from many of which books are lent out, are—taking them in the order of magnitude—those of Bourdeaux, Grenoble, Aix, Nantes, Besançon, Rouen, Troyes, and Douai; the first numbering 300,000 volumes, and the last over 100,000. An important feature of the bibliothecal system of France is the school library. In 1862 it was ordered that to every primary school in the country there should be attached a library, under the care of the schoolmaster, for the use of the children, their parents, and others. They are supported partly by the department and partly by a government grant. In 1882 there were already established under this system 20,000 of these school libraries.

Throughout the German empire the several state libraries and the universities are well provided with books, which in many cases can be borrowed for use outside the libraries. Berlin has over seventy libraries. The royal library, founded in 1659, was opened to the public in 1661. A few years later it became entitled to a copy of every book published within the royal dominion, and it spends £4800 a year on purchases. It now contains about 800,000 volumes. The royal library at Munich owes its origin to Albert V., Duke of Bavaria, in

the middle of the 16th century. It is the largest collection in Germany, and is particularly rich in incunabula. The number of printed volumes contained in it is estimated to exceed a million, and it possesses some 26,000 MSS. In Dresden there are forty-nine libraries. The royal library, founded in the 16th century, now contains 500,000 volumes. About 10,000 volumes are annually lent out to 500 borrowers. The royal library of Stuttgart is an example of rapid growth. It was established in 1765, and in 1880 boasted of possessing about 425,000 printed books and 3800 MSS. It enjoys the copy privilege of Württemberg. The annual number of borrowers is about 1800, and the books lent out 17,000. In the Darmstadt library there are half-a-million volumes, and as many in the university of Leipzig. The universities of Bonn, Berlin, Breslau, Göttingen, Halle, Heidelberg, Munich, Tübingen, and Würzburg contain from 200,000 to 400,000 volumes each; while Strasburg University library, burned in 1870, in twenty years' time counted 640,000.

In Austria-Hungary the universities of Cracow and Gratz, both open to the public, contain over 100,000 volumes, and that of Budapest nearly half-a-million. In Vienna the imperial library, founded by the Emperor Frederick III. in 1449, acquired a large portion of the famous library of Corvinus, and since 1808 has been entitled to the copy privilege of all books published within the empire. It is estimated to contain about 500,000 volumes, of which 20,000 are MSS. The university in the same city is also in possession of the copy privilege, and has about 300,000 volumes, which are freely lent out. Altogether there are in Vienna more than a hundred libraries.

Italy, as might be expected, is rich in old libraries, in incunabula, and manuscripts. The national library of Florence has over 400,000 volumes, the national library of Milan has 300,000, and that of Venice has the same. The royal library of Parma has nearly 200,000, and Milan possesses two libraries with as many. The universities of Bologna, Genoa, Naples, Pisa, and Turin have libraries of the first class. But all these yield in interest to the Vatican Library at Rome, which is probably the oldest in Europe. In mere number of books it is exceeded by many, but its 220,000 printed volumes are of the greatest value, and its 25,000 MSS. include some of the most precious in the world. The Vatican is the private library of the pope, but scholars can gain access to it by permission. As yet, unfortunately, the want of catalogues is a drawback to its usefulness. In Rome, also, the public library, Vittorio Emanuele, to which has been joined the Bibliotheca Casanatense, founded by Cardinal Casanata in 1700, was made up in great part from the old Jesuit library of the Collegio Romano and other suppressed religious institutions, and now contains about half-a-million printed volumes and 7500 MSS. The confiscated monastic libraries helped largely to swell the aggregate number of volumes available for public use. In 1875 it appears that 650 of these collections were added to the contents of public libraries already in existence, while as many as 1050 were used for the formation of more than 400 new communal libraries. In Italy all the public libraries, thirty-two in number, including the national libraries, the university libraries, and the collections of certain academies, are under the authority of the minister of Public Instruction, and their internal management, even to the compilation of their catalogues, the keeping of registers, and the purchase of books, is regulated by a code of rules emanating from the state.

In Spain the national library at Madrid is of the

largest class, with 10,000 MSS. and more than 400,000 printed volumes. It enjoys the copyright privilege for all books published in the kingdom. The Escorial, though much smaller, is valuable, and the same may be said of the university library of Salamanca. The national library of Lisbon has as many MSS. as that of Madrid, and half as many printed books. The large municipal library of Oporto, founded in 1833, was enriched by the collections of suppressed religious houses. Both these libraries claim copies of all books published in Portugal.

In Belgium there are ten large libraries open to the public. The Bibliothèque Royale at Brussels (with which were incorporated the ancient library of the dukes of Burgundy and a large part of the Bollandists' collection) contains more than 350,000 volumes, 30,000 MSS., and 100,000 prints. The privilege of copyright is accorded to publishers only on the condition of their presenting copies of their publication to this library. The university libraries of Ghent and Louvain contain over 250,000 volumes, and that of Liège more than 100,000.

In Holland there are libraries, open to all inquirers, containing from 100,000 to more than double that number in Amsterdam, the Hague (royal library), Leyden, and Utrecht.

In Denmark the royal library of Copenhagen, begun in the middle of the 16th century, has more than half-a-million of volumes, including a rich collection of incunabula and 18,000 MSS. It was opened to the public in 1793, and exacts two copies of all books published in the kingdom. The university library in the same city has about 250,000 printed volumes and 4000 MSS., and also enjoys the privilege of the national copy tax.

The largest collection in Sweden is the royal library of Stockholm, with about 270,000 volumes. The university library of Upsala is not far behind. The university library of Christiania, in Norway, contains about 250,000 volumes.

In Russia the universities of Dorpat, Helsingfors, Kiell, Moscow, and St Petersburg have libraries of more than 100,000 volumes each, but they are not generally open to other than members of the several bodies. The imperial library at St Petersburg, founded at the beginning of the 18th century, is, however, open to all persons over twelve years of age, and in the number of its printed books as well as manuscripts it surpasses the royal library of Munich, possessing as it does about 1,152,000 printed volumes and about 26,000 MSS., some of which are of the highest value. Here is preserved the famous Codex Sinaiticus. This library has grown largely since the beginning of the 19th century. It has more than doubled since 1850. In 1810 the law required two copies of every publication in the empire to be deposited here.

The United States of America have not had the opportunities of Europe in the gradual accumulation of princely collections in the course of centuries, or the advantages possessed by France or Italy in the more recent appropriation of the books and treasures of monastic houses. Moreover, the States, until 1850, showed comparatively little interest in the institution of public libraries outside the universities. In that year the total number of libraries containing 5000 volumes or upwards which could be said to be accessible to the public was estimated at eighty-one, containing among them an aggregate of 980,413 volumes—considerably less than the total number of volumes to be found in the single city of Paris. The movement in favour of free public libraries took place in America about the same time as in England, and since that date nowhere has the accumulation of books been so rapid as in the States, and nowhere has the economy and management of free public libraries

been carried to greater perfection. In 1876 the number of public libraries registered was 3842, containing upwards of 12,569,000 volumes. In the middle of the century there was no library in the States with as many as 75,000 volumes. In 1890 there were at least a dozen with over 100,000. Among the older collections the most notable is that of Harvard University, established in 1638. In 1850 it was estimated to contain in all 72,000 volumes. The number has now risen to more than 250,000, and it increases at the rate of 7000 volumes annually. Yale College, New Haven, which had in 1850 some 21,000 volumes, now has about 180,000. Official libraries have been formed in connection with every state, to which admission is free. The largest of these is the library of the state of New York at Albany, numbering about 140,000 volumes. The library of congress at Washington, which includes the scientific collection of the Smithsonian Institution, is the national library of the United States. It claims, under the copyright laws, two copies of every publication, and has in addition an annual grant from congress of nearly \$60,000. The building now in course of erection will when completed be the largest national library in any country. Of the free town libraries the most important is that of Boston, founded in 1852. In 1881 it had 395,000 volumes, and now has 620,000. In Pennsylvania there are 433 libraries, with a gross total of about two million volumes. Other great libraries have been established and endowed for public use by the munificence of private individuals. The Astor Library at New York, founded by Jacob Astor and augmented by his son and grandson, was opened in 1854, and was able to spend on books \$18,000 a year. The Lenox Library, also at New York, was established in 1870 by Mr James Lenox, who left an endowment of over a million dollars. The Astor, Lenox, and Tilden Libraries were incorporated by a law of 1895 into one having 4,000,000 volumes and an endowment of \$8,000,000. Another notable donation was the Newberry bequest, which became available in 1885, of more than two million dollars for the establishment of a free public library in the north division of Chicago.

In Canada, as yet, there are but few public libraries. That of Toronto, established in 1883, has, however, been a marked success. It now contains about 58,000 volumes. The library of parliament at Ottawa, founded in 1815, has over 100,000 volumes. In Australasia the library movement is striking deeper root. It was calculated in 1887 that there was a public library in Victoria for every 4800 of the inhabitants, as against one for every 277,000 in the United Kingdom. There are in Victoria 425 libraries. The Melbourne public library, founded in 1853, has by the Copyright Act of Victoria privileges like those possessed by the British Museum, and contains 430,000 volumes, pamphlets, and parts. In South Australia there are 140 public libraries, and in New South Wales 160. In 1896 there were in New Zealand 304, and in Tasmania 40 libraries.

The literature of the subject is a large one. Monographs have been written on the principal libraries, ancient and modern; and reports on the national libraries have been issued from time to time by the governments of France, Italy, United States, &c. The most complete general history will be found in the valuable series of works by Mr Edwards, already referred to, *Memoirs of Libraries* (2 vols. 8vo, 1859), *Libraries and Founders of Libraries* (1865), *Free Town Libraries* (1869); and *Free Public Libraries*, by T. Greenwood (3d ed. Lond. 1890). See also the Report from the Select Committee on Public Libraries (1849, 357 pp. fol.); an international list of libraries (Leip. 1890), by P. E. Richter; *How to Form a Library*, by H. B. Wheatley (1886); *The Library*, by A. Lang (1888); G. F. Chambers, *Digest of*

the Laws of Public Libraries (1889); the little treatise of Mr J. D. Mullins on *Free Libraries and News Rooms*. On the subject of library management and cognate subjects much practical information will be found in the volumes of *The Library Journal* (1876 to the present time), New York; the *Transactions and Proceedings of the Library Association of the United Kingdom*, and in *The Librarian*, the present organ of the association, edited by Mr M'Alister. Petzholdt's *Katechismus der Bibliothekentehrer* will be found a useful hand-book. Compare also the articles BIBLIOGRAPHY, BOOKS, BOOK-BINDING, INDEXING, &c.

Libration (from Lat. *libra*, 'a balance,' meaning an oscillating motion), a term denoting certain movements of the moon, chiefly *apparent*, which have an important effect on the apparent position of the lunar formations. A short study of these reveals puzzling changes in their place from night to night. Those near the edge of the disc disappear and reappear in a seemingly irregular way, while central formations approach or leave the centre in harmony with this motion. These appearances are due to an apparent motion of the moon by which its globe seems to turn slightly round to each side alternately, so that we see a little farther round her globe on all sides in turn than we would do if she kept absolutely the same face towards us. This motion, as it refers to the north and south edges of the moon's disc, is called *libration in latitude*; as it refers to the east and west edges, it is called *libration in longitude*. The libration in latitude arises from the inclination of both the lunar equator and orbit to the ecliptic. From the relation between these two factors their effects always reinforce each other, so that when the moon rises above the ecliptic in her orbit she also inclines her under side to us, and when below the ecliptic, her upper side. The libration in longitude arises from the unequal speed of the moon in her orbit (see MOON) combined with her sensibly uniform rotation. She is thus sometimes before or behind her mean place, and we can see a little round her west or east edge respectively. An observer at the north or south pole of the earth will also from his position see a little round the north or south edge of the moon's disc, and for intermediate positions the effect has intermediate values. In the same way an observer in the tropics will see further round the west or east edges of the moon, as he is carried from west to east by the earth's rotation. These effects are known as the *diurnal* or *parallaxic* libration. The maximum libration in longitude is nearly 6° 50'. That in latitude equals 7° 53'. The diurnal libration may rise to 1° 2'. These numbers refer to the apparent displacement of lunar markings in lunar latitude and longitude.

Libretto (Ital. 'little book'), the book of an opera. In too many cases it is deplorable, from the absence of any literary quality, plot, or consistency; and this largely because, almost from the beginning, any poetic or dramatic powers were forced into the Procrustes' bed formed by the requirements of the musician's art. The Italian librettos are especially poor, but many of their English and German rivals run them hard in this respect. Among the most noteworthy librettists have been Metastasio, Calzabigi, and Felice Romano in Italy; Quinault, Marmontel, Scribe, Barbier, Méilhac and Halevy, as well as Sardou, in France; the poet Göbel (who wrote *Lorchy* for Mendelssohn) and Schikaneder (who wrote the *Zauberflöte*, &c. for Mozart) in Germany; and Gay, Alfred Bunn, Edward Fitzball, Theodore Hook, Planché, and Gilbert in England. Wagner stands alone, in that, after the *Flying Dutchman*, he himself wrote the librettos of his great music-dramas, becoming, to use his own words, 'first of all a poet.' Dryden, Addison, Fielding, Chat-

terton, 'Monk' Lewis, Voltaire, and Rousseau, besides Sheridan, Dickens, and Mark Lemon, have attempted libretto-writing; while numerous subjects for operas have been taken from the works of Shakespeare, Goldsmith, Goethe, Scott, Hugo, &c.

Libri-Carrucci. GUILLAUME BRUTTI'S ILLIUS TIMOLLO, COUNT, mathematician and bibliographer, was born at Florence, 2d January 1803. When only twenty years of age he was appointed professor of Mathematics in the university of Pisa. But in 1830, being compromised in the Liberal political movement, he fled to France as a refugee, and there found a patron in Arago (whom he afterwards attacked in a most spiteful manner). He was naturalised, and in 1833 elected member of the Academy of Sciences, professor at the Sorbonne, Chief Inspector of Public Instruction, and Superintendent of the State Libraries. He was, moreover, decorated with the Legion of Honour, and appointed editor of the *Journal des Savants*, &c. An enthusiastic bibliomaniac, he found means to collect a magnificent library for himself; but, being accused of abstracting books and valuable MSS. from the public libraries, he fled to England. In his absence he was tried, and condemned, in June 1850, to ten years' imprisonment. Libri-Carrucci was the author of a learned *Histoire des Sciences Mathématiques en Italie* (4 vols, 1838-41), of *Mémoires de Mathématiques et de Physique* (1829), and other works. He died on 28th September 1869 at Fiesole in Italy.

Libris. EX. See BOOKPLATES.

Libya, the name given by the ancient geographers to that portion of Africa (q.v.) between Egypt, Ethiopia, and the Atlantic.

Lice (*Pediculidae*), a family of small, wingless, parasitic insects, included beside bugs, aphides, Coccidae, &c. in the order Hemiptera or Rhynchota. The body is flat, the legs are short and furnished with firmly-grasping claws, the mouth is suctorial, the eyes are simple. They live on or partly in the skin of vertebrates, usually mammals, and suck the blood of their hosts. The pear-shaped eggs or 'nits' are attached to hairs, feathers, and the like; the young have no metamorphosis, though they may moult as usual. Three species occur on man. The head-louse (*Pediculus capitis*) occurs on the scalp; the body-louse (*P. vestimenti*) lays its eggs in clothes, and is the *P. tuberculatum* of the 'lousy disease' in regard to which many fabulous reports are on record. Both multiply rapidly and give

Pediculus capitis, magnified.

great annoyance, usually preventable by cleanliness, and removable by various (e.g. white precipitate) ointments in the first case, by destroying the clothes, in the second. The 'crab louse' (*Phthirus pubis* or *inguinalis*) is fortunately rarer; it occurs on various parts of the body—pubic regions, axilla, eyebrows, &c. The true lice harboured by dogs, horses, cattle, swine, &c. are referred to the genus *Hemantropinus*. The 'bird lice' (Mallophaga) have mouths adapted for biting, and are not included in the above family or even order, being more nearly allied to the termites than to the bugs. A common and large genus infesting birds is *Phleboterus*; species of *Trichodectes* occur on dogs and sheep.

License. See GAME, DOG, MARRIAGE, EXCISE, &c.

Licensing Laws. From an early period the English parliament devoted special attention to the trade in intoxicating liquors. That trade was

always the chief source of the revenue derived from excise duties and licenses. A general scheme of excise formed part of Pitt's budget of 1784, and was embodied in the Consolidation Act of 1826, which is the basis of the existing law. In 1880 the malt duty was abolished; but brewers and distillers are still required to take out an excise license and to pay duty according to the quantity manufactured. Wholesale or retail dealers in beer, spirits, or wine must also take out a license. The duties on retailers' licenses were transferred to the county councils by the Local Government Act of 1888.

In the case of the manufacturer and the wholesale dealer only the excise license is required; but the retail trade in liquor has been placed, for more than three centuries, under the supervision of the justices of the peace. Every person who keeps or intends to keep a public-house must obtain a license from the magistrates before taking out his excise license. An act of 1830 permitted beer licenses to be taken out without applying to the magistrates; but later acts have brought all beer-houses and refreshment-houses under their control. Under the general Licensing Act of 1828 special sessions are held once a year for the grant and renewal of licenses, and at intervals throughout the year to hear applications for transfer. In counties new licenses are granted by the special sessions, but they must be confirmed by a committee of the county justices. In boroughs having ten or more acting justices, new licenses are granted by a committee and confirmed by the whole body of justices. The license thus granted and confirmed is in force for a year. On applying for a renewal the applicant need not attend in person unless required by the justices to do so; objectors are not heard unless due notice has been given to the applicant, and evidence must be given on oath. Magistrates in licensing sessions are deemed to be acting judicially; they must hear the parties fairly; but they have discretion to grant or refuse any application, and there is no appeal from their decision on the application for a new license. Even a license-holder cannot claim renewal as a right; he has no vested interest. But renewal is, in fact, very seldom refused to persons of decent character, occupying suitable premises; and the practice of the magistrates has made license-holders so far secure that a license is treated, for certain purposes, as if it were a vested interest. Probate duty is paid on the value of a license held by a deceased person; but his representatives may obtain a return of the duty if the magistrates refuse to renew. Licenses for the sale of drink to be consumed off the premises are subject to rules less strict than those which apply to the publican's license. The 'off license' requires no confirmation; and the grounds on which it may be refused are limited and defined by the Wine and Beerhouse Act of 1869. For the detailed provisions of the acts relating to this subject, see Stone's *Justices' Manual*.

The English licensing acts are complicated and confused; but parliament is unable to deal with the subject as a whole, by reason of the controversies which have been raised on particular points. There are now very few advocates of 'free trade in liquor'; nor is there any strong body of opinion in favour of the American high-license system, or of the 'Gothenburg system,' under which the municipalities would take over the liquor shops and manage them in the interest of the community. In England all parties seem to admit that the trade must be restricted as far as possible. Mr Bruce's Act of 1872 (modified in some of its details by the Act of 1874) restricted the issue of new licenses, subjected the publican's trade to stricter supervision, increased the penalties for misconduct,

and shortened the hours within which liquor may be sold. Since the passing of the Act of 1872 no very important change has been made in the law; but the temperance party has put forward various schemes of local option, by which it is proposed to enable a majority of the ratepayers in a district to reduce the number of licensed houses, or even to prohibit the sale of liquor altogether. In 1890 the government proposed to arm the county councils with powers which might have enabled them to reduce the number of public-houses. But the scheme of compensation put forward by the government was so ill received that they were compelled to drop their proposals.

In Scotland the licensing arrangements introduced by the Home Drummmond Act of 1828 bear a general resemblance to those which were established by the English act of the same year. The Forbes Mackenzie Act of 1853 introduced a new form of magistrates' certificate (since amended by acts of 1862 and 1887), the effect of which is to prohibit the sale of liquor between the hours of 11 P.M. in large towns, or 10 P.M. in the country, and 8 A.M., and during the whole of Sunday. The question of grocers' licenses has been much discussed in Scotland, and in 1878 a Royal Commission reported on the subject. See Dewar's *Liquor Laws for Scotland*.

In Ireland licensing authority is exercised, as a general rule, by justices of the peace, and the law is similar to that of England; it is, however, in some points more favourable to the publican. The defects of the law and the laxity with which it is administered have led to the multiplication of licensed houses of an inferior character. 'Six-day licenses' were introduced by an act of 1874; and in 1878 total closing on Sunday was made part of the law for all Ireland, except in the five largest towns in the island. See EXCISE, INN, TEMPERANCE; and for restrictive legislation with regard to the sale of intoxicating drinks in the British colonies and in portions of the United States, see LIQUOR LAWS.

Licentiate, one of the old university Degrees (q.v.). Among Presbyterians a licentiate is a person licensed or authorised by a presbytery to preach, and who thus becomes eligible to a pastoral charge.

Lichen, the name of a group of skin diseases, very variously employed by different writers, but now generally restricted to cases characterised by 'the development of solid persistent papules which undergo but little change till they gradually disappear.' The commoner skin eruptions formerly called lichen, *L. simplex* and *L. tropicus* (or 'prickly-heat'), are abortive forms of eczema. None of those retained under this name is common. *L. circumscriptus* occurs in bright red patches on the back or front of the chest in adults, apparently from the irritation of thick woollen garments worn next the skin. *L. scrofulosorum* is a pale, very chronic papular eruption, sometimes seen in delicate children. *L. planus* or *ruber* is the most characteristic and important of the group; it manifests itself in raised flat patches, of a dull-red colour, usually very chronic in their course, often somewhat itchy. It does not usually interfere much with the health; occurs generally in adults, never in young children; and commonly yields to treatment by arsenic.

Lichenin is a starch-like body found in Iceland moss and other lichens, from which it is extracted by digesting the moss in a cold, weak solution of carbonate of soda for some time, and then boiling. In most of its relations it corresponds with ordinary starch.

Lichens, familiar plants which form encrusting growths on rocks and stones, on the stems and branches of trees, on walls and fences, and on the

earth itself. They are common in every zone, and at all levels from the seashore to the mountain summit. Usually the first plants to settle on a bare, stony surface, they slowly hide the nakedness of the rock with their flat incrustations or shaggy tufts, generally gray or greenish, yellow or red in colour. Especially familiar are the yellow patches which beautify old walls, the hoary tufts which grace decaying trees, and the gray clumps which raise their cup-like fructifications on damp rocks. They are hardy, long-lived plants, able to survive prolonged desiccation.

In 1866 De Bary hinted that lichens were not single plants in a class by themselves, but that they were double plants, each made up of an intimate combination of an alga and a fungus.

Two years later Schwendener virtually established this so-called 'dual hypothesis.' 'As the result of my researches,' he says, 'all these growths (lichens) are not simple plants, not individuals in the ordinary sense of the word; they are rather colonies, consisting of hundreds and thousands of individuals, among which, however, one dominates, while the rest in perpetual captivity prepare the nutriment for them-

selves and their master. This master is a fungus, a parasite which is accustomed to live upon others' work; its slaves are green algae, which it has sought out, or indeed caught hold of and compelled into its service. It surrounds them, as a spider its prey, with a fibrous net of narrow meshes, which is gradually converted into an impenetrable covering; but, while the spider sucks its prey and leaves it dead, the fungus incites the algae found in its net to more rapid activity, indeed to more vigorous increase.' This view has been corroborated by many botanists, especially by

Bornet, Treub, Rees, and Stahl, and is accepted by most, though it is only fair to say that it is still denied and resented by some distinguished lichenologists.

The proof of the theory is twofold; the two component sets of cells have

been studied apart and referred to their position among Algae and Fungi; while, on the other hand, it is possible to manufacture lichens by bringing together the respective algae and fungi which in

Fig. 1.—*Usnea barbata*, a fruticose lichen, natural size: *a*, fructifications; *f*, disc by which it is attached to the bark of the tree.

Fig. 2.—Section through *Caloboma polyporum*, magnified 350 diameters: The threads are the fungus; the round cells the alga.

nature are wont to grow in partnership. For these reasons lichens are regarded not as single, but as double organisms—as an intimate union of algal and fungal cells, living in mutual helpfulness or *symbiosis*. Some at least of the algal cells can live apart, and some become associated with several fungi to form different lichens; but it must be clearly recognised that the customary combinations are of long standing, since the partner fungi do not and cannot live independently. As to the physiological conditions of the partnership, it is enough here to notice that root-like filaments from the fungal cells absorb water and salts from the rain and the substratum, and pass this inorganic material to the algae; that the latter, like all green plants, are able in sunlight to split up the carbonic acid absorbed from the air, and to build up organic compounds like starch; that these organic products pass by osmosis from the algal-cells to the fungus, while it is likely enough that the waste products of the fungus are in turn utilised by the alga. (It is, however, quite probable that the fungi of some lichens in favourable situations among decomposing vegetable matter absorb this in the usual fungal fashion.) To the curious complementary association of fungi and algae to form lichens, a parallel has been demonstrated by Geddes, Brandt, and others, in regard to Radiolarians and some other animals, with which 'yellow cells,' or 'symbiotic algae,' live in habitual partnership (see SYMBIOSIS). Lichens propagate by spores developed in various ways from the component fungus, but with these the partner algae must be speedily associated. In some cases, indeed, fungal-spores and algal-cells are liberated together. Another frequent mode of multiplication is by means of brood-buds, which consist of a few algal-cells plus a separated portion of the fungus.

Most of the lichen-forming fungi are Discomycetes or Pyrenomycetes; the associated algae are very varied—e.g. Palmellaceae, Charolepideae, Nostocaceae, Confervaceae, &c. There are about 6000 species of lichens; for the classification of which reference must be made to the cited literature.

Lichens assist in weathering the surfaces of rocks, into the substance of which the fungi sometimes send numerous filaments, and they are thus the preparers of soil and the forerunners of higher vegetation. 'Iceland Moss' (*Cetraria islandica*) is used for food and medicine; 'Reindeer Moss' (*Cladonia rangiferina*) is the fodder of the reindeer, and is also utilised in Scandinavia for the manufacture of a sort of brandy; pigments known as Litmus, Orseille, &c. are procured from *Roccella tinctoria* and *R. furiformis*, both marine.

Flechtengruppe* (1869); Sachs, *Textbook of Botany* (trans. 1882); Stahl, *Betr. z. Entwicklung d. Flechten* (1877-78); W. A. Leighton, *Lichen-flora of Great Britain and Ireland* (3d ed. 1884). For the works of Johow, Rees, Treub, Takasue, and for the systematic works on lichenology, see references in the above. For a protest against the 'dual hypothesis,' see M. C. Cooke, *British Fresh-water Algae* (Inter. Sc. Series, 1890).

Lichfield, a municipal (and till 1885 parliamentary) borough of Staffordshire, and the seat of a bishopric, is pleasantly situated in a valley watered by an affluent of the Trent, 15 miles S.E. of Stafford and 118 N.W. of London. Population (1801) 4712; (1881) 8349. Its cathedral—a noble pile, measuring 411 feet by 66 (or 149 across the transepts), and surmounted by three towers with

spires, the central 258 feet high—dates from the 13th century, when the Mercian see, founded in 656, and constituted an archbishopric 786-800, was after its translation to Chester in 1075, and subsequently thence to Coventry, re-established here at its original seat. Despoiled, and with its central tower beaten down during the siege of Lichfield by the parliamentarians (1643), the cathedral was subsequently (1661-70) effectively repaired, and of late years (1860-84) both the exterior and interior have been most ably restored at a cost exceeding £40,000, whilst in 1885 a statue of Queen Victoria by the Princess Louise was placed in a niche of the building. At the north-east angle of the Close, adjoining the cathedral, is the Bishop's Palace (1687), and hard by once stood the castle (of which no traces now remain) in which Richard II. held high revelry at Christmas 1397, and where two years later, after his deposition from the throne, he was confined a prisoner. Amongst other edifices may be noted the grammar-school, at which Addison, Dr Johnson, and Garrick were educated; two hospitals founded 1495 and 1504; the theological college (1857); and a concert hall occupying the site of the theatre at which Mrs Siddons made her first appearance after her marriage. In the history of the town the principal incidents, other than those noticed above, have been its partial destruction by fire (1291); five visitations of the plague, which in 1594 claimed 1100 victims, and 821 in 1645-46; a great storm (1593) which blew down the steeples of two of its churches; and seven royal visits. Its 87 bishops include St Chad, De Clinton (who commenced the cathedral), De Langton (who added the Lady Chapel, now thrown into the choir, and rich in stained glass brought in 1802 from the dissolved monastery of Herkenrode in Belgium), Abbot, afterwards Archbishop of Canterbury; Hacket (who carried out the restorations of 1661-70), Hurd (the tutor of George IV.), and George Augustus Selwyn. A statue of Dr Johnson was erected in 1838 in the market-place, opposite the house in which he was born, and which was bought by a Mr Johnson in 1887 'to save it from the hands of spoilers' (*Notes and Queries*, November 19, 1887). Among residents or natives have been Ashmole (founder of the Ashmolean Museum at Oxford), Bishop Newton, Dr Darwin, and his biographer Miss Seward, and Honora Sneyd, afterwards Mrs Edgeworth. Lichfield gives the title of Earl to the family of Anson. See Harwood's *Lichfield* (1806), Erleswick's *Staffordshire* (revised ed. 1844), and Beresford's *Lichfield* ('Diocesan Histories' series, 1883).

Lichtenberg, GEORG CHRISTOPH, physicist and satirist, was born on 1st July 1742, at Oberramstadt near Darmstadt, and educated at Göttingen, where he held the chair of Mathematics from 1770 till within a few years of his death, on 24th February 1799. Two visits to England (1769 and 1774) inspired him with a love for things English; he had a great admiration for Garrick, and wrote a witty commentary on Hogarth's copperplates, *Ausführliche Erklärung der Hogarth'schen Kupferstiche* (1791 et seq.). In Germany he enjoys a high reputation as a satirist, Lavater being an especial sufferer at his hands. All his writings were desultory and occasional, and mostly semi-philosophical in spirit; they show a keen insight into human nature. The best collected edition is that by his sons, 14 vols. 1841-53. See Grisebach's *Gedanken und Maximen aus Lichtenbergs Schriften* (with biography, 1871), and Meyer's comparative study of Swift and Lichtenberg (1886).

Lichtenstein, a town of Saxony, on the Röd-litz, 45 miles S.E. of Leipzig. Pop. 5395. See also LICHTENSTEIN.

Lick Observatory is built on the lowest (4227 feet) of the three summits of Mount Hamilton, 26 miles by a fine mountain-road E. of San Jose, California. For its erection and equipment \$700,000 were left by James Lick (1796-1876), an American millionaire, whose remains are interred in a vault within the foundations of the pier that supports the great telescope. This instrument has an object-glass of 36 inches in aperture, the founder requiring it to be 'superior to and more powerful than any telescope ever yet made;' and it is provided with a photographic attachment which enables it to be used as a gigantic camera in the photography of stars. When completed the observatory was made over to the University of California. See Professor Holden's *Handbook of the Lick Observatory* (San Francisco, 1888).

Lictors. See CONSUL, FASCES.

Liddell, HENRY GEORGE, joint author of *Liddell and Scott's Greek Lexicon*, was born in 1811, and educated at Charterhouse and Christ Church, Oxford, where he took a double first in 1833. He was made tutor of his college, and in 1845 professor of Moral Philosophy in his university. After acting for nine years (1846-55) as head-master of Westminster School, he returned to Christ Church as dean. From 1870 to 1874 he was vice-chancellor of the university. The *Lexicon* (1843; 7th and definitive ed. 1883) was based on the German one of Passow. It soon became indispensable to students of Greek, and a smaller edition was issued for the use of school-boys, an intermediate one in 1890. Dr Liddell's fellow-worker was Robert Scott, D.D. (1811-87), master of Balliol (1854-70), and Dean of Rochester. Dr Liddell wrote a useful *History of Rome* (1855; abridged as *The Student's Rome*). He resigned the deanship in 1891, and died 18th January 1898. See Life by Thompson (1899).

Liddesdale, Roxburghshire, the valley of the Liddel, which flows 27 miles SSW, near or along the Border (q.v.) to the Esk 12 miles N. of Carlisle.

Liddon, HENRY PARRY, D.D., was born at North Stoneham, Hampshire, 20th August 1829, the son of a naval captain, and at the age of seventeen went up from King's College School, London, to Christ Church, Oxford, where in 1850 he graduated B.A. with a second-class in classics, and in 1851 obtained the coveted Johnson theological scholarship. Ordained in 1852 as senior student or fellow of Christ Church, from 1854 to 1859 he was vice-principal of Cuddesdon Theological College. He was appointed prebendary of Salisbury Cathedral in 1864, and was select preacher at Oxford in 1863-65, 1870-72, 1877-79, and 1884. Dr Liddon was a member of the Hebdomadal Council at Oxford from 1866 to 1875. In the former year he delivered his famous Bampton Lectures on the *Dignity of Our Lord* (1867; 13th ed. 1889). In 1870 Dr Liddon was created Canon Residentiary of St Paul's Cathedral, and in the same year was appointed Ireland professor of the Exegesis of the Holy Scripture in Oxford University, when he was created D.D. and honorary D.C.L. He resigned the Ireland professorship in October 1882 in consequence of ill-health, and owing to the same cause it is understood that he more than once afterwards declined a bishopric. In 1869 he republished from the *Guardian* a sketch of 'Walter Kerr Hamilton, Bishop of Salisbury.' He edited in 1874 *Bishop Andrews' Manual for the Sick*, Dr Pusey's *Prayers for a School Boy* in 1883; issued a selection of *Private Prayers* in 1884; and in conjunction with Dr William Bright wrote the *English Church Defence Tracts*. Canon Liddon's sermons have exercised a profound influence upon the thought of the

time, and many of them have been published, including those upon his friends Pusey and Bishop Wilberforce, the sermons preached before the university of Oxford, Lent lectures, and discourses on church troubles. Dr Liddon strongly opposed the Church Discipline Act of 1874, and as warmly supported (by letters in the *Times*) Mr Gladstone's crusade against the Bulgarian atrocities in 1876. He took a great interest in the Conference for the Reunion of the Churches held at Bonn in 1875, and translated Professor Rensch's account of the conference, writing also a preface for the same work. Canon Liddon was the most able and eloquent exponent of Liberal High Church principles. He had long been engaged on the *Life of Dr Pusey*, when he died suddenly at Weston-super-Mare, 9th September 1890.

Lie, JONAS, the most popular novelist of Norway, was born at Eker, near Drammen, on 6th November 1833. He studied law at Christiania, and practised as an advocate for a few years at Kongsvinger; but at length he abandoned his profession for literature. His novels give admirable realistic pictures of life in Norway, especially of the fisher-folk of the west coast. His popularity is due to the sunshine of kindness and delicate poetry that lights up his books, to the healthy tone of his writing, his fidelity to nature, and his genial humour. His best novels include *The Visionary* (1870, trans. 1894), which rapidly ran through half-a-dozen editions; *The Three-master 'Future'* (1872); *The Pilot and his Wife* (1874; Eng. trans. 1877), of which five editions were exhausted in the first year; *Go on* (1882); *A Prisoner for Life* (1883); *The Family at Gilje* (1883), his best novel; *A Whirlpool* (1884); *The Commander's Daughters* (1886); the excellent *Married Life* (1887); and *Maisa Jons* (1889), the life of a Christiania seamstress. Jonas Lie, moreover, has published two collections of *Short Stories* (3d ed. 1880, and 1885), a volume of popular *Poems* (1866), and a successful comedy, *Grabow's Cat* (1880).

Liebig, JUSTUS, FREIHERR VON, chemist, was born at Darmstadt on 12th May 1803. The bent of his mind showed itself early. He studied chemistry at Bonn and Erlangen, and in 1822 went to Paris to perfect his studies. There he was introduced by A. von Humboldt to Gay-Lussac, who took him into his private laboratory, and along with him proved that the fulminates are identical in composition with the cyanates. Humboldt two years later secured for Liebig the appointment of professor of Chemistry at the university of Giessen. This chair he exchanged in 1852 for the corresponding one at Munich. He died on 18th April 1873. In 1845 he had been created Baron (*Freiherr*). Liebig was one of the most illustrious and fruitful chemists of his age, not less renowned for his investigations and discoveries in pure chemistry than for his researches in applied chemistry, and not less honoured for the reformation he effected in chemical method than for his highly important applications of chemical knowledge to the furtherance of the arts of life. As the inventor of the extract of beef and the prepared infant food, his name is known almost everywhere throughout the civilised world. He was the founder of agricultural chemistry, and thus the greatest reformer of practical agriculture in the 19th century. Closely connected with his work in this department were his researches into the nutrition of plants. He taught that each of the non-volatile saline ingredients found in the ash is essential to the life and growth of the plant, and that the plant gets them from the soil; this in course of time exhausts the soil and makes it barren, unless the elements which go to nourish the plant be resupplied to it, whether by means of manure or through the chemical action of the

weather. Thus he directed attention to the cycle of transmutation between the mineral, the vegetable, and the animal kingdoms. In the department of animal physiology he made notable contributions to chemical science, demonstrating, amongst other things, that the heat of the animal body is wholly produced by the processes of internal combustion attendant upon the disintegration of nutritive matters; that different kinds of food serve different purposes in the body, and so admit of classification; that animal fat is produced within the animal organism from sugar and starch; and that spontaneous combustion in the human body is an impossibility. The phenomena of fermentation he explained as being purely chemical. He also investigated the constituents of the juices of flesh, and (along with Wohler, q.v.) of uric acid, with most important results. This brings us to the region of pure organic chemistry. One of the most brilliant instances of the application of the methods of organic analysis in chemistry was Liebig's and Wohler's discovery of the compound radicle benzoyl from the study of oil of bitter almonds and its derivatives. His investigations into the constituents of alcohol and its derivatives led him to oppose the existing view, that of the French chemists, Dumas and Boullay, who regarded alcohol and ether as hydrates of olefiant gas; whereas Liebig denied the existence of the olefiant gas, and believed these compounds to be derivatives of a radicle ethyl, consisting of carbon and hydrogen. In the course of this inquiry he elicited for the first time chloroform and chloral; and it was whilst investigating the conversion of alcohol into acetic acid that he discovered the compound aldehyde. Then, by the clever use of the idea of the polybasic properties of certain acids, he succeeded in determining the constitution of organic acids. Among the practical discoveries and applications of Liebig may be mentioned the invention of silver-coated mirrors, an easy method for the preparation of potassic cyanide, now so largely used in electroplating, his plan for making unfermented bread, and his methods for analysing mineral waters.

When Liebig began to teach there were no public chemical laboratories in Germany. By his initiative one was established at Giessen; and from that have grown the admirably-equipped physical laboratories of the German and other universities. Besides stimulating the study of chemistry in this way, he vastly extended the use of the method of organic analysis, and invented such useful chemical apparatus as the appliances for analysis by combustion, the tube for determining molecular weight, and Liebig's condenser. His most important treatises, all translated into English, were *Arbeitung zur Analyse organischer Körper* (1837); *Die Chemie in ihrer Anwendung auf Agricultur und Physiologie* (1840); *Die Thierchemie* (1842); *Handbuch der organischen Chemie* (1843); *Chemische Untersuchungen über das Fleisch und seine Zubereitung zum Nahrungsmittel* (1847); *Die Grundsätze der Agri-chemie* (1855); *Chemische Briefe* (1844); besides numerous papers in scientific journals (317 in the *Rep. Soc. Trans.*). See works by A. W. Hofmann (1876) and W. A. Shenstone (1895).

Liebrecht, FELIX, a learned linguist and folklorist, was born at Namslau, in Silesia, 13th March 1812; studied at Breslau, Munich, and Berlin; and became in 1849 professor of the German Language at the Athenee Royal in Liège, from which he retired in 1867. Liebrecht early made his name known by a series of admirable articles in various learned journals on the origin and diffusion of popular stories, and by translations enriched with ample annotations no less valuable than the original works themselves. Among these are *Basil's Pentameron, oder das Märchen aller*

Märchen, with a preface by Jakob Grimm (2 vols. 1846); the *Barbaram und Josephat* of Joannes Damascenus (1847); Dunlop's *Geschichte der Prosalichtungen*, with large additions (1851); and an edition of the non-historical mythological portions of Gervase of Tilbury's *Otia Imperialis* (1856). Professor Liebrecht collected his scattered papers in *Zur Volkskunde* (1879), a work which has a place on the shelves of all scientific students of comparative folklore. He died at St Hubart, in Belgium, in August 1890.

Liechtenstein, an independent principality of Europe, separated from Switzerland on the west by the Rhine; on the east it is bounded by Vorarlberg. Area, 61 sq. m.; pop. 9124. It is a mountainous district made up of the lordship of Vaduz and the township of Schellenberg. The chief town, Liechtenstein, formerly called Vaduz (pop. 1018), lies 28 miles SSW. of Bregenz on Lake Constance. The inhabitants carry on agriculture, rear cattle, and cultivate the vine. They are exempt from military duty. Liechtenstein, with several other small states, formed the fifteenth member of the German Confederation until its dissolution in 1866; but in the *Pleuum*, or full Council of the Diet, it had a separate vote. The Prince of Liechtenstein, whose family is one of the most ancient in central Europe, possesses extensive estates in Austria, Prussia, and Saxony. The little state is a constitutional sovereignty, and is ruled by the prince and a legislative assembly of fifteen members, twelve elected by the people and three by the prince. Liechtenstein belongs to the Austrian customs, postal, legal, coinage, judicial, and taxation systems. See works by Falke (3 vols. Vienna, 1868-83) and Krätzl (4th ed. Brunn, 1884).

Liège (Ger. *Lüttich*, Flemish *Luik*), a city of Belgium, occupies a picturesque site at the confluence of the Ourthe with the Meuse, by rail 62 miles S. by E. of Brussels and 47 SW. of Aix-la-Chapelle in Germany. It consists of the old town, built on the hills that overlook the Meuse on the left, the new town, down below on the right bank, and several suburbs. Notwithstanding its great manufacturing industry, it is a beautiful city, with elegant bridges, handsome squares and gardens, and fine churches and private houses. Its defences consist of a ring of modern forts and the old citadel, built in 1650, on the high ground on the left bank of the Meuse. The cathedral church was originally St Lambert's, founded in 712, destroyed by the French republicans in 1794, and wholly removed in 1802. Since that date St Paul's, founded in 968 and completed about 1528, with a good carved pulpit by Geefs, has been the church of the see. Amongst the remaining churches are two (St Denis and Holy Cross) which date from the 10th century, and three (St James', 1016-1528; St Bartholomew's, 11th and 12th centuries, with a beautiful brass font of 1112; and St Martin's, 16th century) with some architectural pretensions. The most notable amongst the secular buildings are the former bishop's palace, built in the Late Gothic style in 1508-40, and now converted into law-courts and administrative offices, and the university. This last was founded in 1817, and has about 70 teachers and 1210 students. The usual adjuncts are attached, including a museum with valuable cave remains, a library of 110,000 vols., a school of mining, and a polytechnic school. Situated in the centre of the east Belgian coal-mining district, Liège is one of the first manufacturing cities in Belgium. Its great staple is the making of firearms, of which it turns out annually (an average of nearly 900,000) more than twice the number of Birmingham and St Etienne together. But manufactories of wool, leather, and

iron-plates, together with, in a secondary degree, iron and other metal works, breweries, and distilleries, give employment to large numbers of men. The government have here a cannon-foundry and a small-arms factory. At Seraing (q.v.), 3 miles distant, are the manufacturing establishments founded by the Englishman Cockerill (q.v.). Pop. (1876) 115,851; (1891) 160,848, mostly Walloons. The Bishop of Maestricht transferred the see to Liège in 720; his successors afterwards attained to the dignity of princes of the empire and bore the title of Duke of Bouillon. The history of Liège is a long struggle between the bishop-princes and the liberty-loving burghers of the city. The latter rose in open revolt in 1407 and 1464, and on subsequent occasions; and it frequently happened that a new bishop could only gain entry into the city when he came with a foreign army at his back, as in 1648 and 1684. The city was seized by Charles the Bold of Burgundy in 1467; but he had to do his work over again, and did it with ruthless severity, in the following year. Liège was again conquered in 1691 by the French, in 1702 by Marlborough, and once more by the French in 1792. The Congress of Vienna assigned the city and the episcopal territories to the Netherlands; but in 1831 they were incorporated in the new kingdom of Belgium. See Histories by Gerlache (3d ed. 1875); Henaux (3d ed. 1876); and Hoek (1885); and compare Scott's *Quentin Durward*.

The *province* of Liège, with an area of 1117 sq. m. and a pop. (1888) of 738,694, lies between the Belgian provinces of Limburg on the north and Luxemburg on the south. In industry it ranks second among the provinces of Belgium, with one-fifth of the total output of the kingdom. Amongst the industries must be mentioned the woollen, iron, coal, steel, zinc, lead, silver, cotton, cloth, machinery, firearms, straw-hats, &c. Cheese (Limburg) and butter are the most valuable of the agricultural products. Very large numbers of pigeons are reared every year as messenger birds—in 1886 nearly a million.

Liegnitz, a town of Prussian Silesia, on the Katzbach, 38 miles W. by N. of Breslau. The town dates from the end of the 10th century. In 1163 it was chosen by the Dukes of Lower Silesia as their place of residence, and from 1241 to 1675 it was the capital of the principality of Liegnitz. In the neighbourhood (Wahlstadt) the Mongols in 1241 defeated the Poles, and filled nine sacks with the ears of their slaughtered foes. Liegnitz came into the hands of Prussia in 1742. Here in 1760 Frederick the Great routed the Austrians under London, and in 1813 Blücher defeated the French (Katzbach). It is now a place of great and varied industrial activity: iron-foundries, machine-shops, pianoforte-factories, and manufactures of woollens, cloth, hats, and gloves, with turnery, brick-making, and pottery, indicate the chief branches. Pop. (1875) 31,442; (1890) 46,874.

Lien (the *tacita hypotheca* of the civil law), in English, Irish, and American law, means the security or hold over goods or land for a debt which is due from the owner of the goods, &c. to the person in whose possession they are for the time. Possession is in general essential to constitute a lien, for the moment the goods are voluntarily parted with the lien is gone. There is an exception, however, in the case of traders like factors, and a lien, though lost, may revive if the property comes again into the possession of the creditor. Liens are general or particular. Thus, a solicitor has a general lien over his client's money, papers, and title deeds till the amount of his bill of costs is paid. So have bankers, dyers, calico-printers, factors. A particular

lien is a lien over goods, for a debt contracted in respect of such goods, as for the price of them, or some labour expended on them. Thus, a miller has a lien on the flour he has ground, a trainer on the horse he has trained, &c. A general lien is favoured by law; a particular lien is construed strictly, for it acts in favour of one creditor as against the others. There are also maritime liens and equitable liens, which do not require possession to constitute the right. The Statute of Limitations does not affect a lien, since it does not take away the right, but only bars its ordinary enforcement by action. In Scotland lien is generally called either Retention or Hypothec (see HYPOTHEC). See works by D. Y. Overton (New York, 1883) and L. A. Jones (2 vols. Boston, 1888).

Lierre, a town of Belgium, 11 miles by rail S.E. of Antwerp, has manufactures of silk, lace, shoes, beet-root sugar, with salt-works and breweries. The Gothic church of St Gummarr (1425-1557) has a fine roof-loft and a picture by Memling. Pop. (1896) 19,300.

Lieutenant (Fr., from Lat. *locum-tenens*, 'holding the place of another'), a term applied to a variety of offices of a representative kind. Thus, in military matters, a *lieutenant-general* is next in rank to a general, a *lieutenant-colonel* next to a colonel. But the title lieutenant, without qualification, denotes the second officer and deputy, or *locum-tenens*, of the troop, battery, or company commander. In the horse and field artillery he has a distinct command—viz. one section of the battery, consisting of two guns with the men, horses, and wagons belonging to them.—*Captain-lieutenant*, an obsolete rank, was the subaltern who commanded the 'colonel's company' in each regiment. The pay of a lieutenant varies from 6s. 6d. a day in the line to 10s. 4d. in the Life Guards. *Second-lieutenant* is the rank given to officers on first joining, corresponding to that of *Cornet* (q.v.) and *Ensign* (q.v.) which formerly existed.

In the British navy lieutenant is a misnomer, and conveys no adequate idea of the rank of the officer bearing that title. His functions from the time of his promotion, and for some eight years afterwards, correspond generally to those of a captain in the army, with whom he ranks, and his ordinary pay is 10s. a day. On attaining, however, eight years' seniority he ranks with a major in the army, and wears an additional stripe of gold lace on his sleeve and a star on his epaulettes as the distinguishing marks of his increased rank, and he now also receives pay at the rate of 12s. a day, which is further increased to 14s. after twelve years' service. The anomaly of the title now comes in, for, although holding field officer's rank, he is still only styled lieutenant. In foreign navies the difficulty is met by there being an intermediate rank between lieutenant and commander. In the German and Austrian navies these officers are styled 'captain-lieutenant,' in the American 'lieutenant-commander,' and in the French 'lieutenant de vaisseau.' Half-pay ranges from 4s. to 8s. 6d. a day. Six years' service afloat as naval cadet and midshipman are requisite to qualify an officer for the rank of lieutenant, and the candidate for that rank has also to pass a satisfactory examination in seamanship and general professional knowledge, which in these days includes navigation and pilotage, gunnery in all its branches, including battalion and field gun drill, electricity and torpedo work, including laying down submarine mines, and also a fair general knowledge of steam. As leaders in all minor enterprises, such as boat expeditions, cutting out, &c., lieutenants in wartime carry off most of the laurels awarded to actions of singular personal daring.

Sub-lieutenant—formerly mate or passed midshipman—is the intermediate rank in the navy between midshipman and lieutenant. When a midshipman has completed the necessary sea-service, he passes his examination in seamanship for the rank of lieutenant; if successful, he becomes an acting-sub-lieutenant, and is sent home to join the Naval College at Greenwich, where he studies for nine months previous to passing his final examination in navigation, mathematics, &c.; he then has to pass through the gunnery and torpedo schools, and also an examination in pilotage. Should he succeed in obtaining a first-class in all the subjects for examination, he is promoted at once to lieutenant, otherwise he is confirmed in the rank of sub-lieutenant, and has to serve at sea in that rank until his turn for promotion comes round. Unless specially promoted, sub-lieutenants have to serve about four years before obtaining their promotion. The obtaining of a first-class in all subjects is therefore an object of considerable importance.

Lieutenant, LORD. See LORD-LIEUTENANT.

Lieutenant-colonel. In the British army, is nominally the second officer of a regiment; but virtually a lieutenant-colonel commands every battalion of infantry and regiment of cavalry, the post of colonel being merely an honourable sinecure, with usually £1000 a year attached, awarded to a general officer. The lieutenant-colonel is responsible for the discipline of his battalion, the comfort of his men, and ultimately for every detail connected with their organisation. In this he is aided by two majors, an adjutant, and a quartermaster. In the artillery and engineers, where the rank of colonel is a substantive rank, with tangible regimental duties, the functions of lieutenant-colonel are more limited, one having charge of every two or three batteries of artillery, or two companies of engineers. The pay of a lieutenant-colonel varies from 17s. per diem in the infantry of the line to £1, 9s. 2d. in the Household Cavalry.

Lieutenant-general. See GENERAL.

Lieutenant-governor. See INDIA.

Life, in Biology, is a general term for the external and internal activities of an organism in relation to its environment. These relations may be referred to the organism as a unity, or they may be expressed more fundamentally, though incompletely, in terms of the physical and chemical changes in the living matter. Between the habits of an organism and the changes in the protoplasm there are, for higher plants and animals, three intermediate grades of interpretations—in terms of the functions of organs, the properties of tissues, and the phases of cell life. But, beyond the higher and lower limits of observable organism on the one hand and of analysable protoplasmic changes on the other, the biologist can speak with no special authority, whatever his opinions may be as to the common denominator—matter and energy, or about the transcendental interpretation of an intelligent organism (see BIOLOGY, CELL, PROTOPLASM).

Characteristics of Organisms.—The boundary between living and not-living matter is much less distinct than rough inspection suggests, but it is quite possible to point out certain characteristics which distinguish living organisms from other objects of our experience which are not-living. Some of the most striking of these characteristics may be summed up in the three words—Continuity, Rhythm, and Freedom. (*a*) So far as our experience goes, all organisms originate from other organisms, and in normal conditions become themselves parents. This fact of continuity is real and literal enough to lend a certain attribute of immortality to life, as may be gathered from the articles

HEREDITY, EMBRYOLOGY, EVOLUTION. (*b*) Organisms take in matter and energy as they live and grow, while on the other hand they also expend energy and are subject to material waste; they feed and work, rest and act, grow and reproduce, in fact pass through a rhythmic cycle of changes such that waste and repair are for variable periods kept in approximate equilibrium. From what we know of the living-matter or 'physical basis of life,' it seems that two vital processes of upbuilding and down-breaking, of composition and decomposition, of synthesis and analysis, of anabolism and katabolism, sum up the changes in the protoplasm (see ANABOLISM, FUNCTION, PROTOPLASM). (*c*) As to freedom, while organisms are much more dependent upon their environment than are inorganic bodies, it is equally true that they attain more apparent freedom. The sustained equilibrium of an organism is unified and dynamical; it admits of direct action upon surroundings, of active thrust as well as more passive parry, of activity which is sometimes called 'automatic' or 'spontaneous,' because it does not occur in direct or traceable response to stimulus from without (see ENVIRONMENT).

Definitions.—Life, like other fundamental facts, eludes definition. Bichat described it as 'the sum of the functions which resist death,' a definition superficially contradictory to Claude Bernard's epigram, 'La vie, c'est la mort.' According to De Blainville, 'life is the twofold internal movement of composition and decomposition, at once general and continuous,' while Spencer's often-quoted definition describes it as 'the definite combination of heterogeneous changes, both simultaneous and successive, in correspondence with external co-existences and sequences.' Lewes defines life as 'a series of definite and successive changes, both of structure and composition, which take place within an individual without destroying its identity,' while Joseph Cook as a transcendentalist calls life 'the invisible, individual, co-ordinating cause directing the forces involved in the production and activity of any organism possessing individuality.' Finally, Latitte, as an expositor of Comte, regards life as 'a general, internal, and continuous phenomenon of composition and decomposition, occurring in a definite organism, placed in a fit medium.' For practical purposes, life is the internal and external activity of an organism in relation to its environment.

The conditions of life vary enormously, for organisms are able to adapt themselves to most diverse environment, including under that term conditions of space and pressure, moisture and oxygen, food, heat, and light, &c. The animal life of the deep-sea illustrates interesting adaptations to great though doubtless unfelt pressure, to darkness, and other peculiar conditions; the minimum life of dried-up spores, Protozoa, ova, small animals, and seeds shows the possibility of persistence for prolonged periods without water; the fauna and flora of arctic snows and seas on the one hand, and of hot springs on the other, illustrate extreme adaptations to diverse temperature conditions; and there are abundant illustrations, from fasting men upwards, of the length of time during which life may continue without food. A few facts may be cited: small nematodes will survive desiccation for fourteen years, and, though the tales of germinating mummy wheat are highly unsatisfactory, it is certain that cereal grains may germinate after ten years' desiccation, and seeds of Leguminosae after several decennia. Seeds rich in ferments and oils have much less power of surviving than those in which starch predominates. As to temperature, dry yeast will live after exposure to 70° C., and a portion survives even at 100° C.; Pasteur heated dry fungoid spores without fatal results to 120° C.,

but the same when moist were killed at the boiling-point. Some bacteria are said to resist boiling, but the reverse is usually true. Kühne killed marine *Amoeba* at 35° C., while fresh-water forms stood 10 more. Even seeds have been known to withstand 100° C., but it is familiar that a longer exposure to much lower temperature is usually fatal. Higher plants have been known to survive burial under a glacier for four years; and fishes, frogs, &c. have often revived after being frozen hard in ice. Dry yeast, according to Cagniard de la Tour (quoted by Huxley), survived - 60° C., but when moist was killed at - 5° C.; yet Cohn cooled bacteria to - 18° C. without death, and seeds have survived such an extreme as - 120° C. To illustrate the diverse sensitiveness of animals, Semper notes that a temperature about the freezing-point of fresh water kills Infusoria but not pond-snails, that the minimum of vital activity in the former was seen at 4° C., in the latter at 12° C., yet the optimum for both is the same—viz. about 25° C. No better instance of experimental work can be referred to than Dr Dallinger's researches, in which he was able slowly to educate Monads, which normally lived at a temperature of 18° C. to thrive at over 70° C. Of the internal conditions of chill-coma, and of the *vita minima* under extremes of heat, desiccation, &c., we know almost nothing.

See DESICCATION, ENVIRONMENT, HIBERNATION; also Huxley's *Anat. of Invert. Animals* (Lond. 1871), Semper's *Animal Life* (Inter. Sc. Series, Lond. 1881), and Wiener's *Biologie der Pflanzen* (Vienna, 1889).

Origin of Life.—It is not a dogma, not yet a 'law of Biogenesis,' but a fact of experience that all living organisms arise from other living organisms—*omne vivum ex vivo*. See ABIIOGENESIS, BATHYBIUS, HEREDITY, SPONTANEOUS GENERATION.

But those who advance beyond an agnostic position as to this problem, and speculate beyond the limits of our experience, give the following four answers to the question of the historical origin of living organisms: (1) Life originated under conditions beyond the sphere of scientific inquiry. Thus, Alfred Russel Wallace postulates a 'spiritual influx' at the origin of life, while theologians are usually more explicit (see CREATION). (2) Organisms or germs of organisms were brought to the earth by meteorites from elsewhere. This hypothesis, supported by Sir William Thomson, shifts the responsibility of the problem off the shoulders of our planet, and leaves the problem of origin—elsewhere. (3) 'The question as to the origin of life,' Professor W. Preyer says, 'is not less transcendental than that as to the origin of matter and energy.' In regard to the latter, it is axiomatic that they had no origin, but are eternal, otherwise matter and energy have arisen out of nothing.' So in regard to life, he argues that it had no thinkable beginning, and that it is as legitimate to suppose that the inorganic originated from organisms as to suppose the converse. In regard to this suggestion it may be noted that while it is quite true that much of the inorganic on the earth has arisen from the work and waste, remains and decomposition of organisms, the forms of life supposed to have persisted in the ancient 'tracts of fluent heat' must have been extraordinarily different from any which we now observe. (4) Living matter evolved of itself from matter which was not living, as the outcome of unexplained processes of chemical upbuilding or synthesis. Professor Ray Lankester suggests further that the first protoplasm fed upon 'the antecedent steps in its own evolution,' 'upon the albuminoids and such other compounds that had been brought into existence by those processes, which culminated in the development of the first protoplasm.' This hypothesis is most in harmony

with the general theory of evolution, of which however it forms no integral part. It has against it the constant fact of experience and result of experiment that all life springs from life, besides serious difficulties in connection with that chemical upbuilding or synthesis, which it is so easy to postulate and so difficult to understand. See also LONGEVITY, IMMORTALITY, TRANSMIGRATION, PRE-EXISTENCE; and for Life Assurance, see INSURANCE.

Lifeboat, a boat adapted to live in a stormy sea with a view to the saving of life from shipwreck. Its qualities must be buoyancy, to avoid foundering when a sea is shipped; strength, to escape destruction from the violence of waves, from a rocky beach, or from a collision with the wreck; great lateral stability, or resistance to upsetting; speed against a heavy sea; facility for launching and taking the shore; immediate self-discharge of any water breaking into her; the important advantage of self-righting if upset; and stowage room for a large number of passengers. Although Henry Greathead (1757-1816), a boat-builder at South Shields, has very generally been credited with designing and building the first lifeboat about the year 1789, yet it is certain that Lionel Lukin, a coach-builder in Long Acre, who was not a resident at a seaport but a native of an inland town, Dummow, in Essex, designed and fitted a boat which he called an 'unimmurable' boat, for saving life in cases of shipwreck, some four or five years before Greathead brought forward his plan for a lifeboat. Lukin took out a patent for his boat in November 1785, and a Bamborough coble which he fitted up was reported to have saved several lives in the course of the first year of its use. Nothing effectual, however, was done for the shipwrecked mariner until the year 1789, when a terrible wreck took place at the mouth of the Tyne, all hands being lost at a short distance from the shore, in the presence of thousands of spectators who were powerless to render any assistance. As the result of the strong feelings which this disaster aroused, a committee was formed at South Shields, and premiums offered for the best model of a lifeboat. From the plans sent in two were selected, one by William Wouldhave, a painter, and the other by Henry Greathead; the latter eventually received the premium, and Greathead, being a boat-builder, was employed to construct a boat on his own plan with some of Wouldhave's ideas introduced. This boat was 30 feet long by 10 feet wide, and rowed ten oars double-banked; it was of the form of a steamer's paddle-box boat, with stem and stern alike, and had a curved keel, which was entirely Greathead's invention. It had, however, no means of freeing itself of water or of self-righting in the event of being upset. Lifeboats on this plan were promptly placed on different parts of the coast, and were the means of saving altogether some hundreds of lives, and even now a few boats of this type are to be found on the north-east coast.

In the year 1823 Sir William Hillary published a powerful appeal to the nation on the subject of the great loss of life from shipwrecks on our coast, and in the following year he induced Thomas Wilson, M.P. for the city of London, to take steps to convene a meeting at the London Tavern, which resulted in the establishment of the Royal National Institution for the Preservation of Life from Shipwreck (now known as the Royal National Lifeboat Institution), under the patronage of George IV. and other members of the royal family, the two archbishops, the principal bishops, and many noblemen and gentlemen. For many years the society did good work on the coast in providing and maintaining lifeboats, and rewarding their crews, &c., but after a time its work

languished. In December 1849, however, another deplorable accident took place at the mouth of the Tyne, when the South Shields lifeboat, on the Greathead plan, which went out, manned by twenty-four pilots, to the assistance of a shipwrecked crew, was upset, and drifted ashore bottom up, no less than twenty of her brave crew being drowned under the boat. This lamentable disaster once again called public attention to the lifeboat work, and in 1850 Admiral the Duke of Northumberland offered the sum of a hundred guineas for the best model of a lifeboat. In response 280 models and plans were sent in, a selection of which was afterwards shown in the Great Exhibition of 1851. James Beeching of Great Yarmouth proved to be the successful candidate for the offered premium, and he constructed a twelve-oared boat on his plan; it was 36 feet long, and was the first self-righting lifeboat ever constructed. Others followed; but, this type of boat not proving altogether satisfactory, the Lifeboat Committee requested one of their number, James Peake, Assistant-master Shipwright in

keel, B, represents the ballast, composed of iron. The festooned lines are the life-lines outside the boat, for men to catch hold of when overboard.

In fig. 2 the unshaded space, A, represents the uncovered part of the deck; B, the relieving-tubes; C, the side air-cases above the deck; D, the end air-cases; E, the ventilating scuttles; F, the water-ballast tanks; G, the plugs; and H, the pumps of the ballast-tanks. Fig. 3 represents the body plan or cross-sections at various distances from stem to stern. Fig. 4 gives the midship section.

The lifeboat transporting-carriage is a very important auxiliary to the boat. Nearly every lifeboat, except a few of the larger size, is provided with a carriage, on which she is kept in the boat-house ready for immediate transportation to the most favourable position for launching to a wreck. A lifeboat is thus made available for a greater extent of coast than she otherwise would be; and even when launched from abreast of the boat-house she can generally be much quicker conveyed to the water's edge than without a carriage. In addition

to this ordinary use, a carriage is of immense service in launching a boat from a beach; indeed, to such an extent is this the case that a boat can be readily launched from a carriage in a high surf, when without one it would often be very difficult to do so. The carriage consists of a fore and main body. The latter is formed of a keelway, and of bilge-ways attached to it, and resting on the main axle, the boat's weight being entirely on the rollers of the keelway. Its leading characteristics are that while for launching it forms an inclined plane, down which the boat can be launched off the rear end with considerable impetus; it can also be used for replacing the boat, the incline plane being reversed by removing the fore-carriage. A very full equipment of stores is

Fig. 3.—Body Plan.

Fig 4.—Midship Section.

Woolwich Dockyard, to embody as many as possible of the good qualities of the best plans into a new design. This was accordingly done, and such a lifeboat was built in Woolwich Dockyard, at the expense of the government. Many modifications and alterations were afterwards made in the boat, and this design of lifeboat has been greatly improved of late years by the officers of the Royal National Lifeboat Institution, so that the self-righting lifeboat can truly be designated an *omnium gatherum*, and cannot be looked upon as any one man's design or invention.

The following drawings show the general outline and principal fittings of a 34 feet by 7½ feet self-righting boat. Fig. 1 gives the profile or broad-side view, the shaded part showing that devoted to the air-cases, which give extra buoyancy. The letter A shows the deck, and the unshaded parts the relieving-tubes, by which any water that breaks on board escapes. The shaded part of the

supplied to the lifeboats of the Institution, such as cork life-belts, anchors and cables, grapnels and lines, life-buoys, lanterns, rockets, and many other articles, together with portable or launching skids.

The boats of the National Lifeboat Institution, and all belonging to them, are kept in roony and substantial boat-houses, under lock and key, in charge of paid coxswains, under the general superintendence of local honorary committees of residents in the several localities. Each boat has its appointed coxswain at a salary of £8, and an assistant at £2 a year, with further allowances under special circumstances. The crew consists, in addition, of a bowman, and as many boatmen as the boat pulls oars. The members of the volunteer crews are registered, and, wherever practicable, at least double the number of men required are entered on the register. Such men are mostly resident boatmen, fishermen, or coastguardmen. On every occasion of going afloat to save life the

coxswain and each of the crew receive alike from the funds of the Institution (whether successful or not) 10s. if by day, and £1 if by night; and usually 4s. each for every time of going aloft for exercise. A reward of 7s. is given to the man who first brings intelligence of a wreck at such a distance along the coast as not to be in sight of the coast-guard station or other lookout. A flag hoisted by day, and the firing of a cannonade (or other alarm signal) by night, are the well-known signals for calling the crew together. On boarding wrecks, the preservation of life is the sole consideration. Should any goods or merchandise be brought into the lifeboat, contrary to the coxswain's remonstrance, he is authorised to throw them overboard.

The average cost of a lifeboat station is £1050, and is made up as follows: Lifeboat and her equipment, £700; boat-house, £350. The average annual expense of maintaining a lifeboat station is £70. The Royal National Lifeboat Institution in 1890 had 297 lifeboats under its management on various parts of the coasts of the United Kingdom. They were instrumental during 1889 in saving 420 lives from different wrecks, besides preserving a vast amount of property, and assisting to save or absolutely saving 17 vessels from partial or total destruction. Besides the laurels resulting in the saving of life or property, the lifeboats went out 141 times in response to signals of distress or what were supposed to be such, only to find either that the vessels were out of danger or that incorrect signals had been made. During the year the Institution also granted rewards for the saving of 207 lives by means of shore-boats, fishing-boats, or by other means, so that the committee bestowed rewards, in the year 1889, for the saving of 627 lives, making a grand total of 34,670 lives, for the saving of which the society has granted rewards since its establishment in 1824. Every effort is made by the committee to place and maintain the lifeboat service in the highest state of efficiency, but this cannot possibly be done without a very large annual outlay. In 1890 the Institution produced the latest novelty in shipbuilding in the shape of a steam lifeboat, which was named the 'Duke of Northumberland,' and stationed at Harwich for trial. The Institution had for several years been earnestly endeavouring, by the offer of gold and silver medals and in other ways, to find a means of propelling lifeboats mechanically. A steel steam lifeboat of 1890 was propelled by a turbine wheel. To the end of 1896 the total number of lives saved was 49,544; in 1896 alone, 461 lives and 29 vessels. The expenditure for the year was £75,417.

Lifeboat societies have been successfully organised on the principles of the Royal National Lifeboat Institution in France, Germany, Spain, Russia, Austria, Italy, Turkey, Holland, and Denmark. In the United States the life-saving service is a government organisation, under the Treasury Department at Washington, and extends to both the sea and lake coasts. There are three classes of stations: (1) complete life-saving stations, with resident crews; (2) lifeboat stations, with a resident keeper only and volunteer crews; and (3) provisioned houses of refuge, in charge of a keeper, for the desolate eastern coast of Florida. At many of the stations the English lifeboat is used, but its weight and draught are too great for use along the flat Atlantic sand-beaches, and there it has been superseded by the light American surf-boat of cedar, fitted with air-cases at the ends and cork fenders. The first lifeboat station was built at Cohasset, Massachusetts, in 1807; the first stations erected by the government were eight, placed on the New Jersey coast, between Sandy Hook and Little Egg Harbor, in 1848. The whole coast is now divided into 12 districts, and the splendid conception of a

girdle of stations round all the sea and lake shores promises to be fulfilled. On the Atlantic coast they are placed 5 miles apart, on an average, and a system of patrol is carefully maintained. The cost of a fully equipped station is about \$6000, and of a house of refuge about half that amount. The keepers receive \$700 a year, the crew each \$50 a month.

Life Guards. See **GUARDS.**

Liferent. in Scotch law, means a right to use a heritable estate for life, the person enjoying it being called a liferenter. For life-estate, in English law, see **ESTATE.**

Life-saving Apparatus. *Life-boats* and *life-belts* and other life-saving appliances are inventions for the preservation of life in cases of shipwreck. In the mercantile marine and passenger ships there are now life-belts for every man and to spare. Buoys are carried on the bridge and at the stern of most ships in the mercantile marine. The danger to ships' ordinary lifeboats is that, from being so long out of the water, unless attended to they get so dry that when floated they fill. Although against regulations, these boats have been known to be filled with cargo. Sometimes the handiest life-buoy is an empty water-cask, well bunged up, and with ropes around it to hold on by. There are various kinds of buoyant pillows, life-jackets of india-rubber cloth, and mattresses. The cork-mattress of Admiral Sir A. P. Ryder can float three men in an upright position.

The life-belt of the Royal National Lifeboat Institution, designed by Admiral Ward in 1854, is

made of cork covered with canvas, and is both strong and buoyant. It has four separate compartments, so that if one should be punctured and burst the belt's buoyant power is not entirely destroyed. It is represented in the fig. Each lifeboatman's life-belt must have sufficient extra buoyancy to support a man heavily clothed, with his head and shoulders above the water, and to enable him to support another person besides himself. It must be flexible in order to fit tightly into the shape of the wearer. There is a division between the upper and lower parts so that it can be securely fastened round the waist, and not impede breathing or the muscular action of the chest or arms.

Life-belt.

The Merchant Shipping Life-saving Appliances Act, 1888, stipulates that the owner and master of every British ship must see that it is provided with such boats, life jackets, and other appliances for saving life at sea as are best adapted for securing the safety of the crew and passengers. The penalty to the owner if in fault in proceeding on a voyage without the necessary life-saving appliances, or if these have been lost or destroyed, is £100; to the master £50, if in fault. The rules which came into force on 1st November 1890 were drawn up by a committee appointed by the President of the Board of Trade, and may be made, rescinded, and varied by the Board. The rules under this act give the number of boats for steamships carrying emigrants, the boats under davits being sufficient to accommodate all persons on board. If the boats under davits do not furnish sufficient accommodation, then additional wood, metal, collapsible, or other boats of approved description, or approved life-rats shall be

carried. Ships of this class must also carry not less than one approved life-buoy for every boat placed under davits, and life-belts sufficient for each person on board ship.

The same regulation as to boats and life-belts and buoys applies to sailing-ships, to steamships carrying passengers between places in the United Kingdom and ports in Europe between the Elbe and Brest, except that a deficiency of boats or life-rafts may be made up by an equivalent number of approved buoyant deck seats or deck fittings. Not fewer than six approved life-buoys must also be carried, and life-belts sufficient for every one on board. The same applies to other steamships carrying passengers within certain specified limits of the home trade; there are also rules for steamers going short excursions, and for those plying on rivers and lakes. The boats must be of lifeboat construction, with approved appliances for lowering them. A life-raft must for every person carried have 3 cubic feet of strong and serviceable enclosed air-tight compartments. Approved buoyant apparatus shall be deemed sufficient for a number of persons to be ascertained by dividing the number of pounds of iron which it is capable of supporting by thirty-two. An approved life-belt shall mean a belt which does not require to be inflated before use, and which is capable of floating in the water for twenty-four hours with 15 lb. of iron suspended from it. An approved life-buoy shall be built of solid cork, and fitted with life-lines and loops, and capable of floating in the water for at least twenty-four hours with 32 lb. of iron suspended from it. All life-belts and life-buoys must be so placed on board ship as to be readily accessible to passengers.

Mortars and Rockets.—When a lifeboat is not at hand, or a raging sea and shoal coast render its use impracticable, a distressed ship may often receive help from shore by means of the mortar or rocket-apparatus. Captain Manby in 1807 invented his *life-mortar*, to discharge a shot with curved barbs that would lay hold of the rigging or bulwarks of the ship; the rocket-apparatus is based upon this. Sergeant Bell of the Royal Artillery had previously (1791) devised a method of firing a shot and line from a distressed ship. Colonel Boxer, Trengrouse, Dennett, Carte, and others made variations and improvements in line-throwing apparatus. (The Lyle gun, the invention of Captain D. A. Lyle, United States army, weighs only 185 lb., has a much longer range than the epouvrette mortar, and combines the other advantages of great strength and simplicity, requiring only the insertion of a cartridge with a line attached to the shot.) The usual method of procedure is to fire a rocket over the wreck; by the light line attached the wrecked crew haul out the whip or double or endless line rove through a tail-block. A thicker rope is pulled over to the ship by means of the line, and a hawser by means of the rope, on which articles can be slung and drawn to and fro. The life-buoy being run out along the rope, the crew can be saved one by one; or, by the life-car, introduced in America about 1848, seven or eight can be drawn ashore at a time. The Life-rocket Department is under the Board of Trade. There were 292 rocket-stations in Great Britain in 1889, 7 chill ladder stations, and 4 heaving-line and life-buoy stations; and 226 lives were saved by means of the rocket apparatus in 1888-89. In 1881 657 lives were saved. The coasts of the United Kingdom are classified into coastguard divisions or wreck-registrars' districts, and the coastguard-inspector has control over all the rockets, mortars, buoys, belts, and lines kept at the various sea-side stations in his district. At each station is kept a cart, expressly made to contain all the requisites for

the rocket-apparatus, ready packed. The Board of Trade now gives a sum of money for every life saved, besides medals for special acts of bravery.

Liffey, a river of Ireland, winding 50 miles westward and east-north-eastward through Wicklow, Kildare, and Dublin counties, to Dublin Bay.

Lifts. Under this term are included numerous contrivances for raising weights. Such machines have various names: hoists—usually hand-worked and for lifting light goods in warehouses; elevators—chiefly used for taking passengers or their luggage, &c. to the upper floors of large hotels, business premises, &c.—and so on. There are also special Elevators (q.v.) for grain. Lifts are often on a large scale, such, for example, as occur on certain canals in place of locks at changes of level—where practically a section of the canal is alternately raised and lowered; and again on underground railways to bring passengers to the surface level (there are notable examples at the Mersey Tunnel).

Lifts consist primarily of a cage for the people or goods raised, a shaft in which this cage works, and the necessary machinery for raising or lowering the cage. There are two chief methods in use for this latter purpose; in the one the cage has attached to its top ropes or chains which are wound up on a barrel or drum; in the other the cage is lifted by hydraulic pressure applied directly, or through the intervention of chains and ropes.

The ropes in use are, for light work, hempen; for heavy work, steel-wire ropes or chains. It is usual to counterbalance the dead-weight—i.e. the weight of the cage; in this case the rope attached to the top of the cage is generally not the lifting rope. The cage-rope is simply carried up to the top of the shaft, over a pulley there, and has suspended at its other end the counterbalance; the working rope operates the shaft of this pulley, and so lifts the cage. This saves a good deal of waste work, since the load lifted each time is only the net load, passengers and goods.

Hoists all require to be provided with some automatic clutch arrangements in case the chains or ropes break, water leaks off, the rams or pistons fracture, &c., otherwise the cages would run down with destructive velocity. These clutches are usually some form of catch kept clear of the side guides in ordinary working, but set in action by compressed springs when an accident happens. They should always be regularly tested to see if they are in working order.

Ligaments are cords, bands, or membranous expansions of white fibrous tissue, which play an extremely important part in the mechanism of joints, seeing that they pass in fixed directions from one bone to another, and serve to limit some movement of a joint, while they freely allow others. Ligaments have been arranged in three classes: (1) *Funicular*, rounded cords, such as the external lateral ligament of the knee-joint, the perpendicular ligament of the ankle-joint, &c.; (2) *Fascicular*, flattened bands, more or less expanded, such as the lateral ligaments of the elbow-joint, and the great majority of ligaments in the body; (3) *Capsular*, which are barrel-shaped expansions attached by their two ends to the two bones entering into the formation of the joint, which they completely but loosely invest; they constitute one of the chief characters of the ball-and-socket joint, and occur in the shoulder and hip joints. See JOINTS.

Ligan. See FLOTSAM.

Ligature, in Surgery. See BLEEDING.

Light. The general doctrine of Light is now only a part of the general theory of Radiation,

which comprises Radiant Heat and Actinic and Electric Radiation as well as Light; but, since the battle as to the nature of radiation in general was first waged round light itself, it is convenient to consider light as representing all the forms of radiation. By elementary observation it is found that light travels (within a uniform medium) in straight lines in all directions; that it accordingly, when proceeding from a point or a very small source, covers areas which vary as the squares of the distance; that shadows obey a similar law; that it is seen some time before the corresponding sound is heard; all which points to a quick propagation of something in straight lines. What is this which is propagated—matter, motion, or condition? The simplest explanation was that luminous bodies emitted something material whose impact affected the sensitive eye; that the reflection of light at surfaces was due to elastic rebound of this quick-travelling material. These phenomena might be equally well explained by waves travelling and being reflected; but Sir Isaac Newton could not reconcile himself to the notion of waves travelling in straight lines and not spreading. This difficulty, which we now know not to be a real one, inasmuch as it is only a question of proportion between the breadth of the wave-front and the distance between successive waves whether a wave-motion shall or shall not travel in straight lines, led him to adopt and develop the corpuscular or emission theory of light. According to this all luminous bodies emit with equal velocities (a troublesome postulate, since the retarding attraction of the sun is so much greater than that of a candle-flame) a number of elastic corpuscles (whose mass must be extremely small, otherwise, with the velocity of more than 186,000 miles per second, their momentum would be destructive), which travel in straight lines, are reflected, and are refracted (provided that they travel *more* rapidly in the denser medium than in air or *in vacuo*, in a direction at right angles to the bounding surface between the rarer and the denser medium). But here begin the difficulties: refraction is always accompanied by reflection, whence some corpuscles enter the denser medium, some rebound; hence a theory of easy fits of reflection and transmission had to be developed, and this involved as its explanation a theory of vibration of a general medium some way in advance of the travelling corpuscles, so as to aid or check their entrance into the denser medium. Newton discovered that the different colours of the spectrum were unequally refracted in glass; from this he had to infer that there were as many different kinds of molecules emitted as there were colours in the spectrum. Then, again, shadows are not absolute; the shadow of a hair produced by sunlight passing through a minute pinhole in which stands a droplet of water is bright in the centre; hence explanations had to be provided to account for the bending of rays round an object; then these explanations failed to account for similar phenomena observed when light was reflected from two mirrors. The theory became loaded with a mass of hypotheses devised to explain each particular phenomenon; but the great authority of Newton maintained its vitality down to the time and person of Sir David Brewster.

The wave-theory of light was suggested by Grimaldi, Hooke, and others; was formed by Huygens (1678), who explained double refraction; lay in abeyance until Young revived it at the beginning of the 19th century; was developed by Fresnel (1815 onwards); and has now definitely displaced the emission-theory. According to it light consists of vibrations in an all-pervading elastic jelly-like ether; the vibrations are, unlike those of sound, in directions at right angles to the direc-

tions of propagation; and 'rays of light' are mere lines showing the direction of propagation of (and in isotropic media at right angles to) the corresponding portions of the wave-front. This theory involves the admission of a vibrating ether; so, indeed, did Newton's. The transmission in straight lines is easily explained; points lying to one side are not affected, because different parts of the wave-front neutralise one another's effects, if the wave-length be relatively small; even sound travelling through large apertures travels in straight lines. The wave-theory readily explains reflection; in refraction it assumes that the waves travel *less* rapidly in the denser medium (which is found to be true, and therefore disposes crucially of the emission-theory), and it explains the accompanying reflected wave; it explains double refraction, polarisation, interference, colour (different wave-lengths), diffraction, &c. Dispersion is not yet completely explained, because data are wanting, though Cauchy's ideas, as developed by Sir William Thomson, have shown that this is a phenomenon of waves of different lengths passing through finely non-homogeneous matter. The wave-theory has also proved the means of forecasting most recondite and unexpected phenomena.

But, then, what is a 'wave?' It is not necessarily a wave of motion. All the phenomena are explicable as phenomena of rhythmical disturbance of some kind, and the 'wave-theory' really goes no further than to state this. The rhythmical disturbance may be one of position (wave-motion), of stress, of electrical condition, possibly of twist in the ether. According to Clerk-Maxwell's theory every portion of the ether in the path of a beam of light is subject to rapidly-alternating stresses transverse to the ray, and is therefore in a rapidly-alternating electric and also in a rapidly-alternating magnetic condition; and the curious relations now known to exist between beams of light and the field of force of a magnet lend the greatest probability to this theory. Besides, Hertz's discoveries (see MAGNETISM) have shown that phenomena of exactly the same character as those of light, and differing only in wave-length, exist in the magnetic field while induction is going on; and all the phenomena of light, radiant heat, and actinic radiation are reduced to phenomena of electromagnetic radiation between certain limits of wave-length.

The velocity of light is found by timing the eclipses of Jupiter's satellites when they are at the greatest and the least distance from the earth, by astronomical aberration-observations, by finding (Fizeau) what speed must be given to a cog-wheel to make it rotate one tooth's-breadth while light is going to a given distant mirror and returning, by finding (Foucault) what position is ultimately assumed by a ray which travels from a source to a rotating mirror, thence to a distant mirror, and thence back to the original mirror, which by this time has been rotated somewhat. In the last method it is found that the interposition of optically denser or more refractive media *retards* the light. The mean of all observations is that light of all wave-lengths travels *in vacuo* with a velocity of 30,057,400,000 centimetres or 186,772 miles per second; in air with a velocity less than this in the ratio of 10,000 to 10,003. The length of waves can be ascertained from measurement, at a sufficient distance, of the fringes produced by interference (q.v.), or by the use of diffraction-gratings ruled with n lines to the centimetre, in which case the wave-length for any particular colour is in centimetres the n th part of the sine of the angle of deflection of that colour in the first 'diffraction-spectrum,' a result easily reached through the general theory of waves. The wave-lengths of

radiant heat, light, and actinic radiations range from $\frac{1}{250}$ cm. or $\frac{1}{10000}$ inch (the longest invisible heat-rays, Langley) to $\frac{1}{3200000}$ cm. or $\frac{1}{129870000}$ inch (invisible actinic rays); the visible limits are $\frac{1}{1000000}$ and $\frac{1}{2500000}$ cm. The frequencies or number of waves per second accordingly range from 20 millions of millions to 40,000 millions of millions per second, the extreme visible limits being 392 and 757 millions of millions per second.

See ABBERRATION, DIFFRACTION, DISPERSION, ETHER, INTERFERENCE, OPTICS, PHOTOGRAPHY, POLARISATION, RADIATION, REFLECTION, REFRACTION, SHADOWS, SPECTRUM; and Fair's *Light*, Glazebrook's *Physical Optics*, Stokes's *Burton Lectures on Light*.

Light and Air, RIGHTS TO. An owner of land has a right to the light and air which pass over it; he has also the right to obstruct the light and air by erecting walls and buildings. If my neighbour builds a house on the edge of my land, he does not thereby acquire any right against me; I may build on my land so as to darken his windows. But I may, by express or implied grant, vest in him the right which is called a Servitude or an Easement—the right to forbid the erection, on my land, of any building which obstructs his lights. Up to this point the Roman, Scotch, and English law are alike in principle. The English law (as amended by the Prescription Act of 1832) allows an easement of light to be acquired against a neighbour by twenty years' enjoyment, without any grant. In Scotland such rights are not acquired by lapse of time; unless a servitude has been created, an owner may at any time build so as to darken his neighbour's windows, provided he does not act wantonly, emulously, or so as to cause a nuisance. Rights to air generally go along with rights to light; and the right is confined to air coming through windows, &c. The English law does not recognise any general right to air, such, e.g., as the right to forbid buildings which prevent air from reaching a windmill. Roman law permitted an owner to acquire a servitude of prospect—i.e. the right to forbid buildings which shut out a fine view; but the English law regards this as a fanciful and inadmissible right. In the United States rights of view—i.e. rights to open windows and to forbid buildings which obstruct them—may be acquired by one owner against another; and in some states they may be acquired by uninterrupted enjoyment for twenty or fifteen years. See Roscoe's *Digest of the Law of Light* (Lond. 1881), and Stimson's *American Statute Law*.

Lighter. See BARGE.

Lightfoot, JOHN, one of the earlier Hebrew scholars of England, was born in 1602 at Stoke-upon-Trent, in Staffordshire, son of the vicar of Uttoxeter. He had his education at Christ's College, Cambridge, and, after taking orders, became chaplain to Sir Rowland Cotton, himself a fair Hebraist. In 1629 appeared his *Erethim, or Miscellaneous Christian and Judaical*, dedicated to Sir R. Cotton, who in 1630 presented him to the rectory of Ashley in Staffordshire, where he laboured with incessant zeal for twelve years. He next removed to London, and was chosen minister of St Bartholomew's, to the parishioners of which he dedicated his *Handful of Glanings out of the Book of Exodus* (1643). Lightfoot was one of the most influential members of the Westminster Assembly in 1643, but often stood alone, as in the Erastian controversy. In the same year he was chosen Master of Catharine Hall, Cambridge, and rector of Much Munden in Hertfordshire, and in 1655 vice-chancellor of the university. At the Restoration he complied with the terms of the Act of Uniformity. He died at Ely, December 6, 1675.

The chief works of this great Rabbinical scholar were

the unfinished *Harmony of the Four Evangelists among themselves* (1644-50); *Commentary upon the Acts of the Apostles* (1645); *The Harmony, Chronicle, and Order of the Old Testament* (1647); of the New (1655); and the *Horn Hebraica et Talmudica* (1658-74; last part posthumously), the great labour of his life. The best edition of his whole works is that edited by the Rev. J. R. Pitman, with a Life (13 vols. 1822-25).

Lightfoot. JOSEPH BARBER, D.D., Bishop of Durham, was born at Liverpool in 1828, and was educated at Trinity College, Cambridge, where he graduated B.A. in 1851 as a wrangler, senior classic, and Chancellor's medallist. He was elected a Fellow of his college in 1852, and gained the Norris University prize in 1853. Ordained in 1854, he became tutor of Trinity College in 1857, Hulsean professor of Divinity at Cambridge in 1861, canon of St Paul's Cathedral in 1871, and Lady Margaret professor of Divinity at Cambridge in 1875. He received his doctor's degree in 1864, was Whitehall preacher in 1866, was appointed examining chaplain to the Archbishop of Canterbury in 1868, honorary Fellow of Trinity College, Cambridge, in 1872, select preacher at Oxford, 1874-75, and one of the Deputy-clerks of the Closet to Her Majesty, February 1875. In 1879 Dr Lightfoot accepted with great reluctance the bishopric of Durham, in succession to Dr Baring. Although confessedly the most learned New Testament scholar in the church, his powers of administration had not been tested; but in the end his appointment was not only justified so far as the diocese of Durham was concerned, but in the wider interests of the Church of England at large. While pursuing in private his own studies, he made Bishop Auckland a centre of learning and teaching for his clergy. He likewise devoted himself with untiring energy to the practical work of his see, and speedily gained the affection and confidence of all with whom he came into contact. The work of the Church Temperance Society and the White Cross Army was specially furthered by his exertions. His munificence was unbounded, and one of his last acts was to build a church at Sunderland as a thank offering for what seemed to be his recovery from a serious illness in 1888. Dr Lightfoot's influence at Cambridge as a great Christian teacher was of incalculable importance, his high personal character as well as his learning having immense weight and influence. A supreme grammarian and painstaking textual critic, he gave the world admirable commentaries on the epistles of Paul to the *Galatians* (1865), *Philippians* (1868), *Colossians* and *Philemon* (1875), to each of which were appended interesting dissertations. Unhappily he was unable to complete the Pauline Epistles, and his exhaustive work on the Apostolic Fathers remains also a splendid fragment, embracing only the two epistles ascribed to *Clement of Rome* (1869; Appendix, 1877; new ed. 1890), and *Ignatius and Polycarp* (1885; 2d ed. 3 vols. 1889). Other works were *On a Fresh Revision of the English New Testament* (1871), an edition of Dean Mansel's treatise on *The Gnostic Heresies of the First and Second Centuries* (1875), and four volumes of sermons published posthumously in 1890. He contributed to the *Journal of Philology*, Dr Smith's *Dictionary of the Bible*, of *Christian Antiquities*, and *Christian Biography*, and published in successive numbers of the *Contemporary Review* a crushing and detailed answer to the anonymous writer of *Supernatural Religion* (collected 1889). Dr Lightfoot, who was never married, died at Bournemouth on December 21, 1889, and was buried at Durham.

Lighthouse, a building erected on some conspicuous part of the coast from which a light is shown at night to guide mariners, and which serves as a landmark by day. Aids to navigation comprise

lighthouses, lightships, beacons, buoys, fog-signals, and landmarks. Lighthouses are generally placed on salient points of the coast-line, islands, isolated or sunken rocks, low promontories, and sandbanks, each requiring structures specially designed to meet the exigencies of such varied sites. When placed on headlands or large islands lighthouses are very much alike in general features, the differences being mainly in the height of the towers, depending on the distance at which the light requires to be seen, and the lighting apparatus. Towers erected on isolated wave-swept rocks in the open sea, such as Smeaton's Eddystone (now superseded by Sir James Douglass's tower), Stevenson's Bell Rock, Walker's Bishop and Wolf Rocks, Alan Stevenson's Skerryvore, David Stevenson's North Unst, and Messrs Stevenson's Dhuheartach and Chickens Rock lighthouses, Alexander's Minot's Ledge and Spectacle Reef in America, and Brehat in France, are triumphs of engineering.

The history of lighthouse construction and illumination may be said to extend over a period of more than two thousand years; but the regularly-organised life-preserving system of modern lighthouse engineering goes back very little further than the beginning of the 19th century. None of the early lighthouse buildings now exist. The Pharos of Alexandria (331 B.C.) gave its name to its successors. The Romans built lighthouses at Ostia, Ravenna, Puteoli, and other ports. The Phœnician Pharos at Coruña was repaired during the reign of the Emperor Trajan, was re-established as a lighthouse about 1634, and in 1847 had a dioptric apparatus placed in it. On the cliff at Boulogne there are the remains of a lighthouse ascribed to Caligula (40 A.D.), and at Dover there are remains of another Roman pharos. Corhan, at the mouth of the Garonne, has seen all the improvements, from the open chautler, in which billets of wood were burned, to the dioptric light combined with a four-wick lamp. Until the end of the 18th century the lighthouses of Britain and America were few in number, and of an inferior description in the great essential of a lighthouse—viz. sending the greatest number of rays of light towards the horizon. Many of the public lights in England were private property, as was also the case with the Isle of May in Scotland, the patent for which was ratified in 1641. There were only twenty-five lighthouse stations and six floating lights in England at the beginning of the 19th century. In 1786 the Northern Lighthouse Board was constituted by act of parliament, but such was the then state of commerce that the act provided for only four lighthouses; now there are no fewer than sixty-seven lighthouses under the Board's jurisdiction. The Irish Lighthouse Board was constituted about the same period. The coast and harbour lights in Great Britain and Ireland are now upwards of 880 in number. In the United States of America the first act of congress relating to lighthouses was passed in 1789, and there are now in American waters 2375 lights and light-ships and 246 fog-signals.

The early lighthouse towers had on their summits grates or chautlers, in which billets of wood or coal were burned, but though expensive to maintain—some of them using 400 tons of coal yearly—were uncertain in their appearance, varying with the ever-changing character of the atmosphere. Such coal-lights survived in Scotland till 1816, in England till 1822, and on the Baltic till 1846. As an example of a modern lighthouse tower we may take Skerryvore, which is 139 feet in height and 42 feet in diameter at the base, containing a mass of 58,580 cubic feet of granite. The foundations of all the towers exposed to the sea are quarried out of the solid rock, and all the courses are dovetailed or joggled together into each other by various devices, and

they are made solid for about 20 or 30 feet above the foundation, where they become divided off into rooms, one above another, access to which is obtained by means of ladders. The difficulties of building are very great, as may be judged from the following facts: Winstanley's Eddystone took four seasons to erect, and was finally swept away, Rudeyard's and also Smeaton's Eddystones took each three years, the Bell Rock took four years, the Skerryvore five, and Dhuheartach three and a half, the great difficulty being to effect a landing of men and materials. At Minot's Ledge, off the Massachusetts coast, General Alexander got only 30 hours of work in the first year and 157 in the second, and the histories of the Bell Rock, Skerryvore, Dhuheartach, Chickens, Eddystone, and some others tell the same tale. The cost of lighthouses may vary much; for instance, the Bell Rock cost £61,000, Skerryvore £86,000, Spectacle Reef, on Lake Huron, £60,000, Bishop £35,000, Dhuheartach £80,000, and North Unst £32,000; and it will be easily seen that an ordinary land-station, fully equipped, will cost much less—as a matter of fact, about £5000 to £10,000. Light-vessels cost about £9000.

Oil-lamps were used in lighthouses at the end of the 16th century; but liquid fuel often gave way to candles of tallow or wax. Smeaton's famous Eddystone was lighted with twenty-four candles, five of which weighed 2 lb. The use of lamps led to reflectors. The early ones were about 18 inches in diameter, and made of small squares of mirror glass, set in plaster of Paris, the lamps having torch-like wicks, the fuel ordinary whale-oil. These lamps did not give good results, and the flat wick, though an improvement, was still unsatisfactory. It was reserved for Argand (q.v.) to devise the cylindrical wick-burner. The height of the flame in the argand lamp varied with the level of the oil in the fountain, and Carcel devised the arrangements for supplying a superabundance of oil to keep the burner cool. Argand's invention is said to have been also discovered by Fenlère, who combined his lamp with the use of reflectors.

By placing a parabolic mirror behind a flame (fig. 1) all the rays of light proceeding from the focus and falling upon its surface are reflected parallel to the axis, and emerge in a beam of light. Such reflectors are generally 21 inches in diameter for fixed and 25 inches for revolving lights, their power being equal to 350 to 450 times the unassisted flame. By arranging a number of reflectors on a frame there can be sent, all round the horizon, a number of beams of light of practically equal intensity, thus producing a *flood* light; and by assembling them on a frame having three or more faces, and making this frame revolve, a *revolving* light results, the rotation of the frame thus producing a succession of light and dark intervals. These reflectors are used in some of the most characteristic lighthouses in Britain. By arranging reflectors in a certain manner on a frame, and causing it to revolve, a group-flashing light can be produced—i.e. one giving two or three flashes in

Fig. 1.

quick succession, followed by a long interval of darkness.

The ordinary parabolic reflector allows about one-third of the rays to escape past the lips by natural divergence. To prevent this waste Mr Thomas Stevenson, in 1849, devised the holophotal

Fig. 2.

reflector (fig. 2), which consists of a lens, *L*, with a parabolic mirror, *a*, and a hemispherical mirror, *bb*, which returns all the rays falling upon it back to the flame.

To Augustin Fresnel (q.v.) belongs the honour of inventing and first employing, in 1822, the dioptric system for lighthouse purposes in combination with a central lamp having four concentric wicks. He was apparently ignorant of what had been done by Buffon and Condorcet in proposing, for burning purposes, to build up lenses in separate pieces with the view of reducing the thickness of glass and correcting to a large extent spherical aberration. So he devised the lighthouse lens, which is plano-convex, 3 feet 3 inches in height by 2 feet 6 inches in breadth, composed of a central disc, surrounded by annular rings gradually decreasing in breadth as they recede from the centre. If these lenses be assembled on a frame with eight or more sides, having a lamp in their common focus, and be made to revolve, a dioptric revolving light is produced. The lens implied a central lamp and a flame of great intensity, which

Fig. 3.—Stevenson's Holophotal Revolving Light of the first order.

this defect. When designing the revolving apparatus for Skerryvore, Mr Alan Stevenson substituted prisms for the mirrors below the lens, and also introduced totally reflecting prisms for first order lights, and, in 1849, Mr

T. Stevenson dispensed with the double agents above and below the lens, and substituted holophotal prisms which parallelise the rays in every plane (fig. 3). The holophotal apparatus is now universally adopted for revolving lights. Fresnel devised the fixed light varied by flashes by placing straight refracting prisms on a revolving frame outside a fixed apparatus. An extension of this is the condensing revolving apparatus which has been carried to such perfection in Scotland, whereby straight refracting or reflecting prisms revolve, and intercept the rays from a central fixed apparatus, so as to produce darkness over the sections they subtend, while they spread the rays which they intercept

Fig. 4.

uniformly over, and thus strengthen, the intermediate sections (fig. 4). The power is increased in proportion to the duration of the intervening periods of darkness. There have been devised by Dr Hopkinson group-flashing lights by splitting up the lens into two or three portions so as to give two or more flashes (fig. 5).

The most notable improvement of recent times in revolving apparatus is what Messrs Stevenson

Fig. 5.—Holophotal Triple-flashing Light, first order.

suggested in 1869, and to which they have given the name *hyper-caboul*. The radius which they adopted was 1330 mm., that of Fresnel being 920 mm. The first lens of this size was made to Messrs Stevenson's design by Messrs Barbier and Fenestre, Paris. When combined with the large flames developed by the increased size of burners now used, this apparatus, when completed with the enlarged prisms above and below the lenses (fig 6), leaves

little to be desired, as all the rays of light are acted on, excessive heat is avoided, and bifurcated and trifurcated arrangements are rendered unnecessary, as one central flame is alone required. It is optically the most efficient apparatus yet made.

Fig. 6. Stevenson's Hyper-radiant Light.

Fresnel not only gave us the dioptric revolving light, but also the fixed dioptric apparatus, showing all round the horizon a vertical strip of light, depending on the diameter of the central flame.

Fig. 7. Fixed Light, first order.

It is said that owing to difficulties of construction Fresnel adopted a polygonal form of thirty-two narrow lenses for the refracting hoop; but Mr Alan Stevenson, when introducing the dioptric light into Britain, designed a truly cylindrical belt, to the different sections of which he gave a rhomboidal form with oblique joints (fig. 7). He also had executed on the large scale totally reflecting prismatic rings.

Fig. 8 is a dioptric spherical mirror, which shows a dioptric holo-
photo, and fig. 9 the dioptric mirror as improved by Mr J. T. Chance, which is largely used in lighthouses, as is also the azimuthal condensing light, introduced by Messrs Stevenson in 1857, to suit the requirements of narrow sounds on the west coast of Scotland, where the light did not require to be of equal power in all directions. As shown by the chart (fig. 10), it is obvious that on the side next the shore no light is required, across the sound a noble light is all that is necessary, while up and

down the sound the sea to be illuminated is of greater or less extent, requiring corresponding intensity. Various applications of Stevenson's condensing principle are now extensively used in lighthouses. The apparent light is another of Mr T. Stevenson's devices for indicating, by means of a beam of parallel rays thrown from the shore, the position of a rock lying at some distance off. By means of apparatus placed on a beacon on the rock, the rays of light from the shore are reflected seawards so

Fig. 8. Dioptric Spherical Mirror.

as to give the appearance of a light on the beacon (fig. 11). Dioptric apparatus were divided into six orders until Messrs Stevenson designed the hyper-radiant apparatus; the following table gives the internal diameter and height of the optical-glass of each:

	Internal Diameter.		Height of Glass-work.	
Hyper-radiant.	8 feet	8.72 inches	11 feet	10.28 inches.
1st Order.	6 "	0.44 "	5 "	8.7 "
2d "	4 "	7.12 "	2 "	0 "
3d "	3 "	3.37 "	5 "	1.5 "
4th "	1 "	7.68 "	2 "	8.06 "
5th "	1 "	2.77 "	1 "	10 "
6th "	0 "	11.81 "	1 "	5.5 "

Lanterns.—The lantern, or framework of glass and metal which contains the lighting apparatus, is an important part of lighthouse economy. The early lanterns had vertical and horizontal sash-bars, but in 1835 Mr Alan Stevenson, when he introduced diagonal framework for the dioptric light, extended it to the lantern.

The diagonal astragals do not intercept light in any azimuth throughout their whole height, and this trigonal arrangement secures a structure of great rigidity and strength. The astragals are of gun-metal, 1 inch section, glazed with plate-glass $\frac{1}{4}$ inch in thickness, unless in peculiarly exposed situations, where it is used $\frac{1}{2}$ inch thick. The first order lantern is 12 feet in

Fig. 9. Chance's Improvement on Fig. 8.

Fig. 10.

diameter, and 10 feet in height of daylight, with an outer and inner dome of copper. Mr Alan Stevenson designed a helical lantern in 1846, but it was not executed. Sir James Douglass, however, recently designed a lantern with helical astragals

14 feet in diameter, glazed with glass $\frac{1}{2}$ inch in thickness, bent to the proper curve. In the Scottish lighthouses 'storm-panes,' which are glazed copper frames, are always in readiness in case of breakage of a pane. They are fixed to the astragals by screws. There is no instance in the Northern Lighthouse service of a lantern-pane being broken by the force of the wind, but they are occasionally broken by birds or by stones being driven against them during strong gales.

Lamps.—The earliest lighthouses had lamps with two or more spouts each with a skein of cotton, until Argand and Teulere gave us the cylindrical burner, Carcel the arrangement for causing a flow of oil over the burner, Rumford the idea of concentric wicks, and Arago and Fresnel the four-wick lamp. Mr Alan Stevenson added a fifth wick, and other lighthouse engineers have

Fig. 11.

develop a flame of great purity and intensity in concentric wick lamps. Single-wick burners draw their supply by the capillary action of the wick, but with multiple-wick burners the oil is supplied by cisterns placed above the level of the burner, or from below by pumps worked by clockwork, or by pressure exerted by a weighted piston. When vegetable or animal oils are employed with multiple-wick lamps the burner requires to be kept cool and the wicks prevented from charring by causing a superabundant supply of oil—nearly three times greater than is consumed—to flow over the wicks, the overflow running back to the cistern. When paraffin is used, however, the fluid is not allowed to rise beyond a certain height in the wick-chambers, the overflow being returned by a tube to the fountain. The satisfactory results in increased photogenic power and economy arising from the use of paraffin have led to the diameters of the burners being much increased. Sir James Douglass has devised burners having seven, eight, and nine concentric wicks, which, of course, greatly increase the candle-power. Messrs Stevenson pointed out, in 1869, that much of the light from burners of greatly increased diameter, when used with revolving apparatus, was not condensed by the lenses, and not properly utilised, and that special apparatus was necessary, and hence their proposal of the hyper radiant apparatus already referred to.

Illuminants.—Almost every kind of oil, animal and vegetable, has been used in lighthouses—whale, sperm, seal, lard, olive, cocoa-nut, hempseed, colza—but these have been superseded by paraffin, not only on financial but on photogenic grounds. Sperm oil was long the illuminant used in British lights, but it gave way, in 1845, to colza at a saving of one-half the cost, while it has been succeeded by paraffin, which has raised the power of the lamps from 10 per cent. in the four-wick burner to over 100 per cent. in the one-wick lamp. Messrs Stevenson, in 1870, set at rest the comparative merits of colza and paraffin, and, when the isolated

rock station of Dhuheartach came to be lighted in 1872, they introduced paraffin as the illuminant. It may be stated that in the Scottish lighthouses alone a sum of between £4000 and £5000 is annually saved by the use of paraffin, while the power of the lights has been exalted; and most lighthouse authorities have followed their example. Paraffin can be readily obtained with a specific gravity of 0.82, and a flashing-point, close test, of 125 to 150 F., and even as high as 250 F. The following is the consumption in gallons per hour of the Doty paraffin burners: 1 wick, 0.15; 2 wicks, 0.55; 3 wicks, 1.26; 4 wicks, 2.05; 5 wicks, 3.73; 6 wicks, 4.99. The use of gas was suggested when gas-lighting was in its infancy, and the experiments did not succeed. Wherever gas can be had, and proper precautions are taken, there can be no doubt of its utility for lighthouse purposes; but when it requires to be specially made at a lighthouse station, either from coal or paraffin, it is expensive. For harbour-lights, where the supply can be readily had, it has long been used with satisfactory results. In 1827 Mr Wilson erected a very simple piece of machinery at Troon for producing an intermittent light from gas, whereby the alternations of light and darkness were got by shutting off the gas so as to extinguish the light, and again as suddenly letting on the full supply, the gas being re-ignited by a separate small burner supplied by a 'by-pass valve.' Mr T. Stevenson proposed to make intermittent gas-lights by causing the flow of gas to produce intermittent action by means of a dry meter. The meter is so made as to pass gas sufficient to keep a small jet constantly burning. The full flame of the large jet continues to burn until the action of the meter cuts off the supply, and the small jet is again kept burning alone until the full supply flows to the larger jet. Mr Wigham of Dublin has devised a system of gas-burners, having five rings of 28, 48, 68, 88, and 108 jets, the diameter of the rings varying from 4 to 11 $\frac{1}{2}$ inches, the power being 250, 680, 990, 1400, and 2300 standard candles respectively. These burners require no glass chimney, and all or any of the rings can be used to suit the state of the atmosphere. He has also strongly advocated, and has introduced at some lighthouses in Ireland, a system of superposed lenses, which have been styled biform, triform, and quadriform lights, each tier of lenses having an independent burner. Sir James Douglass has devised six and ten ring gas-burners, the gas issuing from surface holes, as in the ordinary argand, the power being 850 and 2500 candles respectively. These burners require a glass-chimney. The result of the South Foreland experiments is that, for ordinary lighthouse purposes, paraffin is the most suitable and economical illuminant, and this agrees with the conclusions arrived at by Messrs Stevenson in 1870.

Electric Light.—The electric light was first shown to the mariner in 1838 from the Foreland lighthouse, the generating machine being that of Professor Holmes; but since that date more powerful machines have been devised. The alternate current machines of Baron de Meritens have been used with good results at the Isle of May and other lighthouses. The Isle of May machines are of the L type, of the largest size hitherto constructed, and weigh about 4 $\frac{1}{2}$ tons each. The induction arrangement of each of the two machines consists of 5 sets of 12 permanent magnets, each magnet being made up of 8 plates. The armature, which makes 600 revolutions per minute, is driven by a belt from the engine—16 horse power—is two feet six inches in diameter, and is composed of 5 rings with 24 hobbins on each, arranged in groups of 4 in tension and 6 in quantity. With the circuit open each machine develops an electromotive force

of 80 volts, measured at the distributor; and with the circuit closed through an arc, 40 volts. An average current of 220 amperes is developed, thus yielding an electrical energy of 8800 watts, or 11·8 horse-power in the external circuit. The five rings are so arranged that $\frac{1}{2}$, $\frac{2}{3}$, $\frac{3}{4}$, or the whole of the current of a machine can, at pleasure, be sent to the distributor for transmission to the lantern, and the two machines can be coupled and the full current from both be employed during hazy weather. The current is conveyed to the lighthouse—a distance of 880 feet—by solid copper conductors 1 inch in diameter, with scarphed joints bolted and soldered together. The lamps are of the Serrin-Berjot type, with some modifications—notably the shunt or by-pass, whereby a large percentage of the current goes direct to the lower carbon. The carbons, which are 1·6 inch in diameter, have a core of pure graphite, and burn with great steadiness at the rate of 2 inches per hour.

The dioptric apparatus, originally used with the electric arc, was too small, and Messrs Stevenson in 1865 suggested that it should be third order, and this was generally adopted; but at the Isle of May it was made second order condensing, so as to give a group of four flashes in quick succession, with intervals of darkness of thirty seconds, the whole light being condensed into three degrees, the resulting beams being equal to three million candles with single power, and six million with double power. It is seen thirty per cent. oftener than a first-class revolving dioptric light. At Souther Point, the Forclands, Lizard, the apparatus is third order. At St Catherine's and Tino it is second order, while at Macquarie it is first order.

Characteristics.—The following are the main distinctions in use: (1) fixed lights; (2) the revolving light, which at equal periods comes into view and gradually attains its full power and then gradually disappears; (3) revolving red and white, showing alternately flashes of red and white light; (4) flashing, showing flashes at short intervals; (5) intermittent, which bursts instantaneously into full power, and, after remaining as a fixed light for a certain period, is suddenly eclipsed; and (6) group flashing, consisting of two or more flashes separated by short eclipses, the groups being separated by a longer eclipse. The use of colour is resorted to for danger arcs, or when another characteristic is not available. The two colours employed are *red* and *green*, generally produced by coloured chimneys over the lamps. Experiments made at Edinburgh show that light, in passing through red glass, should be $4\frac{1}{2}$ times stronger than for a light of the natural colour—a loss slightly redeemed in thick weather owing to the red rays not being so much absorbed.

Machines.—If the apparatus revolves, motion is generally produced by clockwork and by the fall of a weight. In the case of small apparatus, Messrs Stevenson produced motion by means of the heat from the burner causing a fan to revolve, which has since been adopted in the Trotter-Linberg system.

Distribution. The coasts of all countries have three lines of defence. There are first great sea lights which indicate important 'landfalls,' and require the most powerful apparatus; secondary lights which, though not requiring to be so powerful as those of the first order, are of great importance, as indicating turning-points in the navigation; and, lastly, harbour lights to guide ships into havens of safety. It has been laid down as an axiom by lighthouse engineers that over-sea lights of similar character should not be placed nearer each other than 100 miles, and that if possible lights near coast-lines much frequented by shipping should be designed to overlap each other.

Lightships. Light-vessels are moored in situations where it would be impossible to erect a lighthouse. They are generally wooden ships, 103 feet in length between perpendiculars, and 23½ feet beam, strongly built, copper fastened, and sheathed with muntz metal. The North Carr Light-ship, at the entrance of the Forth, is moored by a 12-inch studded chain cable and 3-ton anchor, as it is in a very exposed situation, and the engines for the fog-signal are driven by steam. The lantern is 8 feet in diameter, of steel, carried on a steel mast. The apparatus consists of eight fixed dioptric apparatus, each of 180, fitted with spherical mirrors and argand lamps. Each apparatus, with its fountain and lamp, is hung on gimbals, so balanced as to hang vertically in any position of the mast within 30 degrees of the vertical.

Early light-vessels had small lanterns suspended from the yard-arms. Mr R. Stevenson, in 1807, introduced a lantern which surrounded the mast, and all subsequent lightship lanterns have been made on his plan. All floating lights had catoptric apparatus until Messrs Stevenson, when designing the Hooghly lightships, employed dioptric apparatus. Sir James Douglass has done much to improve the lanterns of light-vessels, and introduced two-wick lamps instead of single argands.

Fog signals.—The average duration of fog on the whole coast of England is only slightly over 400 hours yearly, though in some parts it reaches 1080 hours. In Scotland the average is under 400 hours yearly, while at some parts of the coast of the United States the average is 2226 hours yearly, the highest being 2454 hours. There are few coast lighthouse stations where a phonic signal would not be a useful auxiliary, as there are times when the most powerful lights, even the electric, are obscured by dense fog, when the sailor must be guided by signals addressed to the ear. Various instruments have been used, such as bells, gongs, steam-whistles, guns, sound-rockets, tonite charges, reed trumpets, and sirens sounded by compressed air or steam. The Daboll fog-horn and siren are of American origin, the siren being the most powerful in use; but, though it has been heard at distances of upwards of 20 nautical miles, there are certain conditions of the atmosphere when its effective range is limited to 2 or 3 miles. Though bells are not effective signals, no fewer than 55 of them are used in British and 158 in American waters; and since 1811, when Stevenson introduced fog bells at the Bell Rock Tower, all subsequent rock lighthouses, owing to the want of space for other signals, have been supplied with them. Such rock tower bells vary from 3 cwt. to 2 tons. It has been found that when struck by a hammer outside, instead of by a clapper, the sound is heard at a greater distance, and when the blows are struck in rapid succession for a short time the sound is more penetrative. For the sake of distinction two bells of different tone, struck after each other, are sometimes used. Gongs, struck by hand, are still employed on board some lightships; but though the sound is distinctive it is not heard at any great distance. Steam-whistles are largely used in the United States, and guns are still employed at a few stations. Sound-rockets are charged with the ordinary composition to carry the rocket up to a height of 600 feet, when a charge of cotton powder is exploded with a report like the discharge of a piece of ordnance. The charges of cotton powder are generally 4 ounces, but 12 ounce charges are sometimes used when there is wind along with the fog. Tonite signals are used at eleven stations in Britain. The charges consist of small cylindrical discs of dry cotton powder (tonite), 4 ounces in weight, each having a hole up the centre for receiving the detonator, which is a copper tube

containing fulminate composition. The charge is fired by connecting it with an electric cable attached to a small electro-magnetic machine standing in the light-room. A light framework or jib is fixed outside the lantern, counterbalanced and raised by means of wheel-work to about 12 feet above the lantern. When the charge and detonator are attached to the ends of an electric cable, the jib is hoisted, the firing handle of the electric machine is raised and smartly pushed down, when the fuse and detonator fires the charge, which gives a loud report. An arrangement is made so that the circuit cannot be closed until the jib and charge are raised to the full height above the lantern. The Babbell horn is a metal trumpet in which a metallic reed or tongue 18 inches long, 2½ inches broad, and varying from ¼ to ½ inch in thickness at the free end, is made to vibrate by compressed air or steam being blown through it. This signal is effective, though not so powerful as that of the siren. The siren consists of a trumpet having two discs, 12-inch diameter, one of which is fixed, and one rotating with radial slits cut in them. The rotation is from 1500 to 2000 times a minute, with air at 20 lb. pressure per square inch. Holmes' siren is automatic, consisting of two cylinders having angular slots, one being fixed and the other free to rotate within the fixed cylinder; the compressed air impinging against the inclined sides of the slots causes the inner cylinder to revolve, the rapid passage of one row of slots over the other produces a series of vibrations which give the note desired, and notes of different pitch can also be produced. Sirens are used at 41 stations in British waters. At Ailsa Craig, Messrs Stevenson adopted a central station, the compressed air, at 75 lb. per square inch, being conveyed to distances of ¾ and ½ mile respectively. The south signal gives 3 blasts in quick succession every 3 minutes, the first a high note, the second a low note, the third a high note; while the north gives one blast of 5 seconds duration every 3 minutes. These signals are so arranged as to begin to sound about 1½ minute before each other, and never together. The motive power is five gas-engines, one being spare, the gas being made from the paraffin used in the lighthouse lamps. As regards the distance to which the compressed air is carried, this was a new departure in fog signalling. These signals are actuated by compressed air, the motive power being hot air, steam or gas engines, or, as at Corsewall in Scotland, by Priestman's oil-engines, with ordinary lighthouse paraffin oil as the explosive.

Administration.—British lighthouses are managed by three boards—the Trinity House for England, the Commissioners of Northern Lights for Scotland and the Isle of Man, and the Ballast Board, Dublin, for Ireland; the Board of Trade, by the Mercantile Marine Act of 1854, having control over the three boards in finance and other matters. Some colonial lights are also under the control of the Board of Trade. For the United States of America a Lighthouse Board was constituted in 1852, the Treasury defraying the cost of erecting and maintaining lighthouses and other aids to navigation. In France the lighthouse service is under the minister of Public Works and a special 'Commission des Phares.' In Sweden, Norway, Holland, Denmark, Russia, and Austria the lighthouse administration is under the Admiralty or minister of Marine. In Spain the system of administration is similar to that of France.

Lightkeepers. At lighthouse stations on shore there are two keepers, while at rock stations there are generally four, one being always on shore by rotation. Where there is a fog-signal at any station there are generally three keepers, and at electric light stations there are five, one

of them being a mechanical engineer. The crews of light-ships are eleven in number, three of the crew and the master or mate getting on shore by rotation.

Lightning (Fr. *éclair*, Ger. *Blitz*), the name given to the visible discharge of electricity between one group of clouds and another, or between the clouds and the ground. Thunder-clouds, well known by their dark and heavy look, belong usually to the cumulus type (see CLOUDS), and are found at all heights from close to or almost touching the ground up to about 6000 feet. But most of the summer thunder-clouds in Great Britain float at an altitude of from 1000 to 3000 feet. On elevated mountain-tops, 12,000 feet high or more, lightning and hail showers accompany the passage of cirrus clouds over them. Lightning occurs in three distinct forms, commonly called forked-lightning, sheet-lightning, and ball-lightning, the last class serving also as a convenient term for unexplained phenomena.

Forked-lightning appears as long flashes passing from cloud to cloud or between clouds and the ground. It gets its name from the apparently sharp bends it makes, but most photographs of lightning show it in a wavy or ribbon-like form. Occasionally it splits into several branches at one or both ends.

Photograph of Lightning (from *Knowledge*, June 1889).

These flashes frequently pass between clouds several miles apart, lengths of 6, 8, and even 10 miles having been observed. The thunder which accompanies this form of lightning is due to the intense and sudden heat developed in the path of the discharge expanding the air with explosive rapidity. As sound travels slowly compared with electricity and light, the noise from different parts of the flash reaches the ear in succession, and aided by echoes from the clouds, produces the prolonged rolling of the thunder-peal. The distance away of the flash can be estimated by the time between the flash and the beginning of the thunder, every 5 seconds being equivalent to 1 mile; 50 seconds or 10 miles is the

greatest observed interval at which thunder has been heard.

Sheet-lightning, sometimes called summer-lightning, is a frequent accompaniment of warm weather in temperate climates and an almost daily phenomenon in most tropical regions. It appears as a diffuse glare lighting up a whole cloud, is often of a reddish colour, and is believed to be due to discharges of feebleness than those causing forked-lightning. It may occasionally be merely the reflection on the cloud of a distant thunderstorm invisible to the spectator.

Ball-lightning is an as yet unexplained phenomenon; forked and sheet lightning are the gigantic analogues of the spark and glow from an electric machine, but nothing resembling the slow-moving, luminous globe described by those who have seen ball-lightning has ever been produced artificially. The ball has been estimated at from a few inches to over a yard in diameter; and, while not affecting anything that it does not directly touch, acts like an explosive shell on any solid body in its track, throwing down walls, making holes several feet deep in the ground, or plunging long trenches; sometimes disappearing with a loud report, at others gradually getting smaller till it vanishes. This destructive and dangerous form of lightning is happily very rare. Allied to lightning is St Elmo's Fire (q.v.). See Arthur Parnell, *The Action of Lightning* (1882).

Death by Lightning is always instantaneous, and is probably always caused by the shock to the brain and nervous system. The post-mortem appearances are extremely variable. Sometimes no marks of injury are found; but more often lacerations, bruises, burns, and occasionally even fractures of bones are present. The clothes may be burnt or torn, even when the surface of the body is not injured; metallic substances on the person may be fused, and steel magnetised. When the accident is not immediately fatal, the consequences are still more variable; insensibility, paralysis, burns, wounds, loss of hair, eruptions on the skin, hemorrhages, loss of speech or of one or more of the special senses, may all occur. The treatment must be directed to the special symptoms, which are liable to great variations. Sir B. Brodie's advice is as follows: 'Expose the body to a moderate warmth, so as to prevent the loss of animal heat, to which it is always liable when the functions of the brain are suspended or impaired, and inflate the lungs, so as to imitate natural respiration as nearly as possible.' These means should be fully tried, as respiratory action has been restored after more than an hour's suspension.

LIGHTNING-CONDUCTOR (Fr. *paratonnerre*, Ger. *Blitzableiter*). The object of a lightning-conductor is twofold: first, and most important, to drain away the electricity from passing clouds and thus prevent the occurrence of lightning in its neighbourhood; and secondly, when unable to do this, to receive and convey to earth the lightning-flash without damage to the building to which it is attached. The first object is best secured by the lightning-conductor being a sharp-pointed metallic rod standing clear above all surrounding buildings, trees, &c.; while the second necessitates its having considerable diameter to carry the short-lived but intense current produced by the flash; both require that it should be in thorough metallic connection with the earth. The action of the lightning-conductor may be illustrated by an electric machine. When the machine is in action the prime conductor, which corresponds to the thunder-cloud, discharges a rapid succession of flashes or sparks; but if a pointed metallic rod is held near it all sparking ceases, the electricity is drawn off silently as fast as it is generated by the

machine, while if a ball or blunt rod is placed near the conductor in thorough connection with the ground the sparks will pass to it as the easiest passage to earth. Good copper is almost six times better a conductor of electricity than iron, and therefore lightning-conductors are usually made of copper; but they may be equally well constructed of iron if made $2\frac{1}{2}$ times the diameter, so as to equalise their conducting power. For ordinary buildings the diameter of the rod should be at least $\frac{1}{2}$ inch for copper or $\frac{1}{4}$ inch for iron; lighthouses and similar exposed buildings are usually fitted with copper conductors $\frac{1}{2}$ inch in diameter. Instead of a solid rod, wire-rope of equivalent size is frequently used for convenience of adjustment to the buildings. The top of the conductor, always a solid rod, ends in a blunt point surrounded a few inches down by three or four sharp points projecting obliquely upwards, but not rising as high as the top; these points ought to be platinised or gilded to prevent oxidation. The rod must project higher than any other part of the building. It has been found that, roughly speaking, a lightning-conductor protects from direct flashes a conical space equal to its height with a radius at the base of double its height. Thus, a rod standing 6 feet above the gable end of an ordinary house will protect the roof ridge for 12 feet along, but if the house is more than 12 feet broad will not protect the other gable. All large masses of metal in a building, more especially the roof-gutters, should be connected with the lightning-conductor, as they may otherwise form a broken connection to earth and conduct the lightning with dangerous sparking at the breaks. Sharp bends must be avoided in the conductor, and any joints in it should be braced, or embedded in a large mass of solder, so as to avoid any risk of heating at the junction by imperfect contact. Perhaps the most important part of the lightning-conductor, and certainly the part in which it is most difficult to ensure satisfactory arrangement and workmanship, is the connection to earth. Dry earth is practically a non-conductor of electricity; damp earth is a moderately good conductor, and, being of infinite area compared with any lightning-conductor, can safely receive any discharge. The problem therefore is to make a satisfactory junction with a sufficiently large area of damp soil. This is usually done by attaching to the lower end of the lightning-conductor a brass plate about a yard square, and burying it in a damp spot surrounded by gas-coke. Sometimes the lightning-conductor is connected to an iron water or drain pipe, but not a gas-pipe, as the risk of setting fire to the gas from a spark at a break must not be incurred. A faulty earth connection makes a lightning-conductor worse than useless. Every large building requires more than one conductor, and perfect safety can only be ensured by a town or district having a sufficient number of conductors to drain passing thunder-clouds of their electricity and prevent flashes from ever occurring. The first lightning-conductor was erected by Benjamin Franklin on his own house in Philadelphia in 1752. See *Edinburgh Review* for July 1884; and O. J. Lodge, *Lightning Conductors* (1892).

LIGHTNING PRINTS are appearances, sometimes found on the skin or clothing of men or animals that either have been struck by lightning or have been in the vicinity of the stroke, and are currently believed to be pictorial representations of surrounding objects or scenery. The existence of such prints appears, from a theoretical point of view, highly improbable, as the essential conditions of forming a photographic image are wanting; still, several apparently well-authenticated instances have been recorded, one or two of which may serve to give a general idea of what are meant by lightning prints. On the 14th of November 1830

lightning struck the Chateau of Benatonière, in La Vendée; at the time a lady happened to be seated on a chair in the salon, and on the back of her dress were printed minutely the ornaments on the back of the chair. In September 1857 a peasant-girl, while herding a cow in the department of Seine-et-Marne, was overtaken by a thunderstorm. She took refuge under a tree; and the tree, the cow, and herself were struck with lightning. The cow was killed, but she recovered, and, on loosening her dress for the sake of respiring freely, she saw a picture of the cow upon her breast. These anecdotes are typical of a great mass of others. They tell of metallic objects printed on the skin, of clothes while being worn receiving impressions of neighbouring objects, or of the skin being pictured with surrounding scenery or objects during thunderstorms. One object very generally spoken of as being printed is a neighbouring tree. This may be accounted for by supposing that the lightning-discharge has taken place on the skin in the form of the electric brush (see ELECTRICITY), which has the strongest possible resemblance to a tree, and that this being imprinted on the skin by a slight charring of the tissues in its track has led observers to confound it with a neighbouring tree. Of other prints it would be difficult to give a satisfactory account, though observers have done something in imitation of them. When a coin is placed on glass and a stream of sparks poured on it from a powerful electrical machine, on the glass being breathed upon after its removal a distinct image of the coin is traced out by the dew of the breath. The parts of the glass surface in contact with the metal having received a different charge from the rest, a selective action by the glass on the dew of the breath takes place; but this is very different from the permanent image of the anecdote. With all due allowance for the possible printing-power of lightning, the accounts given of it in most cases bear the stamp of exaggeration.

Lights, USE OF, IN PUBLIC WORSHIP, a practice which prevailed in the Jewish (Exod. xxv. 31-39) and in most of the ancient religions, and which is retained both in the Roman and in the Oriental churches. The use of lights in the night-services, and in subterranean churches, such as those of the early Christians in the catacombs, is of course easily intelligible; but the practice, as bearing also a symbolical allusion to the 'Light of the World' and to the 'Light of Faith,' was not confined to occasions of necessity, but appears to have been from an early time an accompaniment of Christian worship, especially in connection with the sacraments of baptism and the eucharist. The time of the service in which lights are used has varied very much in different ages; but eventually it was extended to the entire time of the mass. In other services, also, lights have been used from an early period; e.g. lighted tapers were placed in the hand of the newly baptised, a usage still retained in the Roman Catholic Church. Two candles are *de rigueur* at mass, and four at high mass; but the most profuse use of lights is reserved for Benediction, and other services connected with the Exposition of the Host. The usage of blessing the Paschal Light is described at HOLY WEEK. The material used for lights in churches is either oil or wax; the latter in penitential seasons, and in services for the dead, being of a yellow colour. An oil lamp always burns in a Roman Catholic church to indicate the presence of the Host in the tabernacle on the altar. In the Anglican Church candle-sticks, and in some instances candles themselves, are retained in many churches, on the communion table, but in the majority of instances they are not lighted. The use of lights, except where required for giving light, has been declared illegal more than once since 1855. In the Presbyterian

and Independent churches the symbolical use of lights is rejected as superstitious.

Ligne, CHARLES JOSEPH, PRINCE DE, son of an imperial field-marshal whose seat was at Ligne, near Tournai, was born at Brussels, 23d May 1735, and as an Austrian soldier served at Kolin, Leuthen, Hochkirch, &c., in the war of the Bavarian succession, and under London at the siege of Belgrade (1789). Meanwhile he had undertaken various diplomatic missions and received numerous distinctions. A Belgian by birth, an Austrian subject, the favourite of Maria Theresa and Catharine of Russia, the friend of Frederick the Great, Voltaire, Rousseau, he was always a most welcome guest at the court of Versailles and in the Paris salons. He died 13th December 1814. Of his literary remains there were published *Mélanges* (34 vols. 1795-1811), *Œuvres Posthumes* (6 vols. 1817), a life of Prince Eugene (1809), and a collection by Madame de Staël of his *Lettres et Pensées* (1809). A new edition of his works in 4 vols. was published at Brussels in 1860. See a monograph by Thürheim (Vienna, 1876), and the *Edinburgh Review* for July 1890.

Lignin. See CELLULOSE.

Lignite, or BROWN COAL, a mineral substance of vegetable origin, like common coal, but differing from it in its more distinctly fibrous or woody formation, which is sometimes so perfect that the original structure of the wood can be discerned with the microscope, whilst its external form is also not infrequently preserved. In this state it is often called *Wood Coal*; and it sometimes occurs so little mineralised that it may be used for the purposes of wood, as at Vitry on the banks of the Seine, where the woodwork of a house has been made of it. From this to the most perfectly mineralised state it occurs in all different stages. It is often brown or brownish black, more rarely gray. It burns without swelling or running, with a weaker flame than coal; emits in burning a smell like that of peat, and leaves an ash more resembling that of wood than of coal. Wherever it occurs in sufficient abundance it is used for fuel, although as a rule very inferior to common coal. Lignite occurs sparingly in Britain—the chief locality being Govey Tracey in Devonshire, where it has long been worked. The principal repository of lignite in Europe is the Oligocene System (q.v.) of Germany, in which some of the beds attain a great thickness. Over the eastern slopes of the Rocky Mountains lignite is widely distributed, but the beds are rarely thick enough to be of economic importance. Thin beds of lignite are associated with the oligocene basalt rocks of Iceland (where it is known as 'Surtur-brand') and the Faroë Islands, just as is the case with the similar formations in Antrim and Mull.

Unlike wood, it is soluble in nitric acid and in alkaline hypochlorites, and refractory to caustic potash solution; in the latter respect it resembles coal, which is, however, not soluble in hypochlorites.

Lignum Rhodii. See CONVULVULUS.

Lignum Vitæ. See GUAIACUM.

Ligny, a Belgian village, 13 miles by rail N.E. of Charleroi, famous for the defeat of the Prussians under Blucher by the French under Napoleon, 16th June 1815, the same day on which Ney's command was engaged with the British under Wellington at Quatre-Bras. The Prussians lost 12,000 men and 21 cannon; the French, 7,000 men. See Gardner's *Quatre Bras, Ligny, and Waterloo* (1882).

Ligonyi, or ELGON, a mountain, 14,000 feet high, situated to the west of Lake Baringo in East

Equatorial Africa, with extensive artificial caves, some inhabited.

Ligulate, in Botany. See COMPOSITE.

Liguori, St ALFONSO MARIA DE, founder of the order of Liguorians or Redemptorists, was born of a noble family at Naples, 27th September 1696, and embraced the profession of the law, which, however, he suddenly relinquished to devote himself entirely to a religious life. He received priest's orders in 1725, and in 1732, with twelve companions, founded the association now called by his name. In 1762 he was appointed Bishop of Sant' Agata dei Goti, in the kingdom of Naples, and his life as a bishop was a model of the pastoral character; but shrinking from the responsibilities of such an office he resigned his see in 1775, after which date he returned to his order and continued to live in the same simple austerity as had characterised his early life. He died at Nocera dei Pagani, August 1, 1787, and was canonised in 1839. Liguori is one of the most voluminous and most popular of Catholic theological writers. His works embrace almost every department of theological learning—divinity, casuistry, exegesis, history, canon law, hagiography, asceticism, and even poetry. His correspondence also is voluminous, but is almost entirely on spiritual subjects. The principles of casuistry explained by Liguori have been received with much favour in the modern Roman schools; and in that church his moral theology, which is a modification of the so-called 'probabilistic system' of the age immediately before his own, is largely used in the direction of consciences (see CASUISTRY). Liguori's *Theologia Moralis* (8 vols.) has been reprinted numberless times, as also most of his ascetic works. The most complete edition of his works (in Italian and Latin) is that of Monza (70 vols.). They have been translated entire into French and German, and in great part into English, Spanish, Polish, &c.

The LIGURIANS, called also REDEMPTORISTS, are a congregation of missionary priests founded by Liguori in 1732, and approved by Pope Benedict XIV. in 1759. Their object is the religious instruction of the people and the reform of public morality by periodically visiting, preaching, and hearing confessions, with the consent and under the direction of the parish clergy. Their instructions are ordered to be of the plainest and most simple character, and their ministrations are entirely without pomp or ceremonial. The congregation was founded originally in Naples, but it afterwards extended to Germany, Switzerland, and Austria. In France, England, Ireland, and America, though houses of the congregation have been founded, their place is in great measure occupied by the more active congregation of the Lazarist or Vincentian Fathers (see VINCENT DE PAUL).

See Faber, *Life of St. Alphonso de Liguori* (4 vols. 1819); Meyrick, *Moral and Devotional Theology* (1857); and a short Life published by Sampkin in 1880.

Liguria. See GENOA, ROME.

Li Hung Chang, Chinese statesman, was born 26th January 1823, rose to be governor of Kiangsu (1861), and with 'Chinese' Gordon (q.v.) drove out the Taipings. He founded the Chinese navy, promoted the mercantile marine, and at the disastrous war with Japan (1894) was chief minister. He was dismissed and restored, negotiated peace, and visited Europe in 1896. He intimated with Russia, and in 1900 left his post at Canton to take a conspicuous (but suspected) part in the negotiations after the relief of the Legations. See Life by R. K. Douglas (1895).

Lilac (*Syringa*), a genus of Oleaceæ (q.v.). Busbeck (q.v.) it was who introduced the Common Lilac (*S. vulgaris*) from Persia as well as

the tulip into European gardens. From Vienna it soon spread, so that it is now to be found half wild in the hedges of some parts of Europe. There are many varieties. The flowers grow in large conical panicles; are of a bluish 'lilac' colour, purple or white, and have a very delicious odour. The leaves are a favourite food of cantharides. The bitter extract of the unripe capsules has very marked tonic and febrifugal properties. The wood is fine-grained and is used for inlaying, turning, and the making of small articles. A fragrant oil can be obtained from it by distillation. The Chinese Lilac (*S. chinensis*) has larger flowers, but with less powerful odour, and the Persian Lilac (*S. persica*) has narrower leaves. Both are often planted in gardens and pleasure-grounds. There are several other species.

Lilburne, John. See LEVELLETS.

Liliaceæ, a natural order of endogenous plants, containing about 1200 known species. They are most numerous in the warmer parts of the temperate zones. They are mostly herbaceous plants, with bulbous or tuberous, sometimes fibrous roots; rarely shrubs or trees. The shrubby and arborescent species are mostly tropical. The stem is simple, or branching towards the top, leafless or leafy. The leaves are simple, generally narrow, sometimes cylindrical, sometimes fistular. The flowers are generally large, with six-cleft or six-toothed perianth, and grow singly or in spikes, racemes, umbels, heads, or panicles. The stamens are six, opposite to the segments of the perianth; the pistil has a superior three-celled, many-seeded ovary, and a single style. The fruit is succulent or capsular; the seeds packed one upon another in two rows. This order contains many of our finest garden, greenhouse, and hothouse flowers, as lilies, tulips, dog's-tooth violet, Lily of the valley, tuberose, crown imperial and other fritillaries, hyacinths, *Gloriosa superba*; many species useful for food, as garlic, onion, leek, and other species of *Allium*, asparagus, the Quamash or Biscuit Root (*Camassia esculenta*) of North America, the Ti (*Draecena terminalis* or *Cordylone Ti*) of the South Seas, &c.; many species valuable in medicine, as squill, aloes, &c.; and some valuable for the fibre which their leaves yield, as New Zealand Flax, and the species of Bow-string Hemp, or *Sauvicularia*.—This natural order has been the subject of a number of splendid works, such as Redouté's *Les Liliacées* (8 vols. Paris, 1802–16).

Lilith. See ADAM.

Lille (Flemish *Rijssele*), a manufacturing town and first-class fortress of France, chief town of the department of Nord, is situated on a sub-tributary of the Scheldt, in a fertile district, 66 miles by rail SE. of Calais. Lille derives its name from the castle around which it originally arose, and which from its position in the midst of marshes was called L'Isle. It was founded early in the 11th century by the counts of Flanders. From 1305 it was mortgaged to France, but passed to Burgundy in 1365. Louis XIV. conquered the town in 1667, and, though it was recaptured by Marlborough and Prince Eugene in 1708, the Austrians restored it in 1713. In 1792 it successfully resisted the determined attacks of the Austrians. Its present defences consist of a pentagonal citadel, the work of Vauban, and a series of seven forts encircling the town. The old fortifications were for the most part levelled from 1858 onwards. The town is modern built and possesses few notable buildings except the church of Notre Dame (1855), and the town-hall with the museum, the famous Weier collection of drawings by the Old Masters, and a library of 41,000 volumes. The principal institutions are a Catholic free university, independent faculties of medicine and science, technical schools, a music

school, and an academy of art. Lille is a great centre of textile industries: the spinning of linen and cotton, the manufacture of thread, damask, cloth, tulle, tickings, &c.—these textile industries give employment to nearly 20,000 workpeople of tobacco, beer, paper, and sugar, dye-works, bleach ing fields, the fabrication of machinery, and oil-works indicate the chief industries. Pop. (1872) 152,775; (1886) 151,397; (1891) 160,966. See Van Hende, *Histoire de Lille* (2d ed. 1875).

Lillebonne, a town of Normandy, on the Bolbec, 28 miles WNW. of Rouen by rail. The *Julia Bana* of the Romans, it has very interesting remains of a Roman theatre, laid open in 1812; a 15th-century church; and a ruined castle of William the Conqueror. Pop. 5852.

Lillibullero, the famous political ballad that 'sung James H. out of three kingdoms.' A scurrilous attack on the Irish recruits, it is said to have been written by Lord Wharton in 1686, and the setting is ascribed to Henry Purcell.

Lilliput, the name of a fabulous kingdom described by Swift in *Gulliver's Travels*, of which the inhabitants are not greater in size than an ordinary man's finger.

Lillo, GEORGE, English dramatist, was born in London on 4th February 1693, and died on 3d September 1739. Whilst carrying on the business of a jeweller in London he wrote seven plays, two of which are frequently printed in collections of acting-plays. These are *Fatal Curiosity* (1736) and *George Barnwell* (1732), both admirably constructed and with truly tragic conclusions, though the language is inflated and conventional. His *Arden of Feversham* (written in 1736, not published till 1762) is a very good version of an old anonymous play bearing the same title, written in 1592 and reprinted by A. B. Bullen in 1888. Apart from the tragic quality of his plays, Lillo deserves mention as being almost the first English playwright to take his characters from middle-class life. For long it was an old custom to act *George Barnwell* in certain London theatres on the night after Christmas and on Easter Monday. See Lillo's *Dramatic Works, with Life* (2 vols. 1772).

Lilly, WILLIAM, astrologer, was born at Diseworth, Leicestershire, 1st May 1602. He was educated at Ashby-de-la-Zouche, and in 1620 found his way to London, where for seven years he served an ancient citizen, married his widow, and on her death in 1633 obtained a fortune of £1000. He now turned to astrology, soon acquiring a considerable fame and large profits as a caster of nativities and a predictor of future events. In 1634 he obtained permission from the Dean of Westminster to search for hidden treasure in the cloister of Westminster Abbey, but was driven from his midnight work by a storm, which he ascribes to demons. From 1644 till his death he annually issued his *Martianus Anglicus, Junior*, containing vaticinations, to which no small importance was attached by many. In the Civil War he attached himself to the parliamentary party as soon as it promised to be successful, and was rewarded with a pension, but it is highly unlikely that his own accounts of his intimacy with Lenthall, Whitelocke, Ashmole, and others are true. After the Restoration he was for some time imprisoned, on the supposition that he was acquainted with the secrets of the Republicans; but being set free, he retired to the country. He was again apprehended on suspicion of knowing something of the causes of the great fire of London in 1666. He died, 9th June 1681, at his estate at Hersham in Surrey. Lilly wrote nearly a score of works on his favourite subject, which are of no value whatever, except to illustrate the knavery

of their author and the credulity of his countrymen. Dr Nash's judgment of him as 'a time-serving rascal' may be allowed to stand—he was gibbeted by Butler under the name of Sidrophel. See his *History of his Life and Times* (1715).

Lily (*Lilium*), a genus of plants of the natural order Liliaceæ, containing a number of species much prized for the size and beauty of their flowers. The perianth is bell-shaped, and its segments are often bent back at the extremity. The root is a scaly bulb, the stem herbaceous and simple, often several feet high, bearing the flowers near its summit. The White Lily (*L. candidum*), a native of the Levant, has been long cultivated in gardens, and much sung by poets. It has large, pure white flowers, as much prized for their fragrance as for their beauty. The Orange Lily (*L. bulbiferum*), a native of the south of Europe, with large, erect, orange-coloured flowers, is a well-known and very showy ornament of the flower-garden. The Martagon or Turk's Cap Lily (*L. Martagon*), a

a, *Lilium testaceum*; b, *Lilium chalcedonicum*, Scarlet Turk's Cap.

native of the south of Europe, and allied species with verticillate leaves and drooping flowers, are also common in gardens. *L. chalcedonicum*, a native of the Levant, is a very brilliant species, and has been in cultivation about 300 years. The Tiger Lily (*L. tigrinum*) is a native of China, remarkable for the axillary buds on the stem; and some very fine species are natives of North America, as *L. superbum*, which grows in marshes in the United States, has a stem 6 to 8 feet high, and reflexed orange flowers, spotted with black; *L. canadense*, &c. Several very fine species have been introduced from Japan, as *L. japonicum*, *L. speciosum*, and *L. lancifolium*. The bulbs of *L. pauciflorum*, *L. Martagon*, and *L. kamschatcense* are roasted and eaten in Siberia. That of *L. candidum* loses its acridity by drying, roasting, or boiling; when cooked it is viscid, pulpy, and sugary, and is eaten in some parts of the East. Lilies are generally propagated by offset bulbs. A single scale of the bulb will, however, suffice to produce a new plant, or even part of a scale, of which skilful gardeners avail themselves.—The name lily is often popularly extended to flowers of other genera of the same order, and even of allied orders. For Lily of the Nile, see ARUM. See also FLEUR-DE-LIS.

Lily, GIGANTIC (*Dorogathes eccelsa*), of Australia, a plant of the natural order Amaryllidaceæ, with flowering stem 10 or 14, sometimes 20 feet high, bearing at top a cluster of large crimson blossoms. The stem is leafy, but the largest leaves are near the root. This plant is found on both the mountains and the sea-coast of New South Wales, and is of splendid beauty. The fibre of its leaves has been found excellent for ropes and for textile fabrics.

Lily of the Valley (*Convallaria*), a genus of plants of the natural order Liliaceæ, having terminal racemes of flowers; a white, bell-shaped, or tubular 6-cleft or 6-toothed perianth; a 3-celled germen, with two ovules in each cell, and a succulent fruit. The species commonly known as the Lily of the Valley (*C. majalis*), the *Maiden* or

Mayflower of the Germans, grows in bushy places and woods in Europe, the North of Asia, and North America, and has a leafless scape, with a raceme of small flowers turned to one side. It is a universal favourite, on account of its pleasing appearance, the fragrance of its flowers, and the early season at which

Lily of the Valley (*Convallaria majalis*).

they appear. It is therefore very often cultivated in gardens, and forced to earlier flowering in hot-houses. Varieties are in cultivation with red, variegated, and double flowers. The berries, the root, and the flowers have a nauseous, bitter, and somewhat acrid taste and purgative and diuretic effects. The smell of the flowers when in large quantity, and in a close apartment, is narcotic. Dried and powdered, they become a stimulant. The esteemed *Eau d'or* of the French is a water distilled from the flowers.—Allied to Lily of the Valley is Solomon's Seal (q.v.).

Lily, John, euphuist. See LILY.

Lilybæum. See MARSALA.

Lilye, or LILY, WILLIAM, classical grammarian, was born at Odiham, in Hampshire, about 1466, and graduated at Oxford, being elected deny of Magdalen in 1486. Having taken his B.A. degree, he travelled to the East; and at Rhodes, then the home of the Knights Hospitallers, he learned Greek from refugees from Constantinople. He afterwards spent some time studying Greek and Latin in Rome and Venice, and returned home about 1509. After teaching for a while privately in London he was appointed (1512) by Dean Colet the first head-master of the new St Paul's school; this post he held till he was carried off by the plague towards the end of 1522. Lilye, who has good claims to be considered the first who taught Greek in London, had a hand in Colet's *Bevisian Institution*, which, as corrected by Lilye's friend Erasmus, and redacted by Lilye himself, was known as the *Eton Latin Grammar*. Lilye's share embraced the lines on the genders of nouns, beginning 'Propria que maribus,' and those on the conjugation of verbs, 'As in presenti,' if no more. Besides this he wrote Latin poems, printed along with those of another great friend, Sir Thomas More, at Basel in 1518,

and a volume of Latin verse against a rival school-master, entitled *Autoboscon ad Gulielmum Horumannum* (1521).

Lima, the capital of Peru, lies in a broad valley 6 miles E. of Callao, its port, with which it is connected by two railways (9 miles). A small stream, the Rimac, flows through the city, which is laid out in regular lines, with wide, straight streets, thirty-three *plazas*, and houses mostly of one story. The seat of an archbishop, it contains not less than seventy-two sacred buildings, and the cathedral (rebuilt 1746) is, after that of Mexico, the most noteworthy in Spanish America. Among other buildings that call for mention are the Franciscan and Dominican monasteries, the latter possessing the loftiest tower in the city; and the houses of congress, formerly the headquarters of the Inquisition and of the university. The university (1551) is now housed in the old Jesuits' college; and there are also a theological seminary and several special schools, besides a botanical garden and a national library. The last institution was looted during the Chilian occupation (1881-83), and numerous statues and works of art found their way at the same time to Santiago. This disaster, added to earthquakes and revolutions, has wrought sad havoc in Lima, which remains still picturesque and beautiful, but somewhat shabby and very dirty. The trade is left almost entirely in the hands of foreigners. The manufactures are not of importance, but include the casting of iron, copper-smelting, and the preparation of furniture, silver-ware, gold-lace, and stamped leather. There is a railway to Oroya (128 miles). Lima was founded as *Ciudad de los Reyes* (the monarchs of Spain and the Three Magi), on 18th January 1535, by Pizarro, who was murdered here in 1511, and sleeps in the crypt below the cathedral. The name was afterwards changed back to that of the Indian village that had occupied the site. Earthquakes have been numerous, the most disastrous, that of 1746, destroying 5000 out of the 60,000 inhabitants. The climate of Lima is agreeable and on the whole healthy, although consumption and fevers are common. Pop. (1876) 101,488; (1895) 100,191.

Lima, capital of Allen county, Ohio, 71 miles N. of Dayton, on the Ottawa River, where several railways cross. It has steam-mills and manufactures of engines, furniture, &c. Pop. 7567.

Limasol, or LIMASSOL (Gr. *Levasson*), the chief seaport of Cyprus. It has no harbour, but the water is not so shallow as at Larnaka; and there is a large trade, chiefly with France, in wine and carobs. Limasol is the only place in Cyprus where English troops are permanently quartered—some in the town and 300 three miles inland. Pop. (1878) 6000; (1890) nearly 10,000.

Lima-wood, a name of the dye-wood also called Pernambuco-wood and Nicaragua-wood. See BRAZIL-WOOD.

Limbach, a Saxon town, 10 miles WNW. of Chemnitz, with hosiery manufactures. Pop. 10,494.

Limber is half the field equipage of a Cannon (q.v.).

Limborch, PHILIP VAN, Remonstrant theologian, was born at Amsterdam in 1633, studied there and at Utrecht, and afterwards served as a preacher at Gouda and Amsterdam, and became in 1668 professor in the Remonstrant college at Amsterdam, where he died in 1712. Of his numerous and learned works most valuable for the fullness and clearness of its exposition is his *Institutiones Theologicæ Christianæ* (1686; 5th ed. 1735). An English translation of this, by W. Jones, was

printed in 1702; and of his *History of the Inquisition*, by S. Chandler, in 1731.

Limburg, a territory on the Meuse, lying between the provinces of Liège and Brabant, was created a countship soon after its annexation by the German king (870). Shortly after 1151 it was made a duchy. The battle of Woeringen (1288) gave it to the Dukes of Brabant, after which it shared the fortunes of that state. At the peace of Münster (1648) it was divided between the United Provinces and Spain, but was again united under French rule from 1794 to 1830, and from 1830 to 1839 under the Belgian king. In 1839 it was once more divided, the lands to the west of the Meuse remaining with Belgium, whilst a long narrow strip on the east side of the river was constituted the Dutch province of Limburg. The soil of both provinces is in parts fertile, though large portions of the area are covered with moors. The marshy district of the Peel intrudes into the north of Dutch Limburg. The Belgian province has an area of 931 sq. m. and a pop. (1891) of 223,531. Capital, Hasselt. The area of the Dutch province is 930 sq. m.; pop. (1891) 259,593. Capital, Maestricht.—The well-known *Limburg cheese* is made at the little town of Limburg (pop. 4768), the former capital of the duchy, which is now in the province of Liège, 19 miles E. of the city of Liège. The old castle was destroyed by the French in 1675.—LIMBURG-AN-DER-LAHN, a town of Hesse-Nassau, 32 miles E. of Coblenz by rail, has a fine Catholic cathedral (1243). Pop. 6485.

Limbus, the name assigned by Roman Catholic theologians to that place on the fringe of hell (*Limbus patrum*) in which the just who died before Christ were detained till His resurrection, and also where infants are kept who die in original sin without baptism (*Limbus infantium*). Limbus is not a place of torture, but of a joy imperfect, and therein unlike the joy of heaven. Infants suffer only the 'pain of loss,' and in no respect the 'pain of sense,' the most aggravated of the tortures of Hell (q.v.).

Lime is the monoxide of the metal Calcium (q.v.), and is known in chemistry as one of the alkaline earths. Its symbol is CaO, its equivalent is 56, and its specific gravity is 3.08. In a state of purity it is a white caustic powder, with an alkaline reaction, and so non-fusible as to resist even the heat of the oxyhydrogen flame (see LIME-LIGHT). It is obtained by heating pure carbonate of lime (as, for instance, white Carrara marble or Iceland spar) to full redness, when the carbonic acid is expelled and lime is left. This compound, CaO, is known as *quicklime*, or, from the ordinary method of obtaining it, as *burned lime*, to distinguish it from the *hydrate of lime*, or *slaked lime*, which is represented by the formula CaO, H₂O. On pouring water on quicklime there is an augmentation of bulk, and the two enter energetically into combination; and, if the proportion of water be not too great, a light, white, dry powder is formed, and a great heat is evolved. On exposing the hydrate to a red heat the water is expelled and quicklime is left.

If quicklime, instead of being treated with water, is simply exposed to the air, it slowly attracts both aqueous vapour and carbonic acid, and becomes what is termed *air-slaked*, the resulting compound in this case being a powder which is a mixture of carbonate and hydrate of lime. Owing to this property quicklime is employed to prevent instruments and other objects from being rusted or otherwise injured by damp. A jar is partly filled with lime and placed beside the articles in a glass case or box.

Lime is about twice as soluble in cold as in boiling water, but even cold water only takes up about

$\frac{1}{35}$ of its weight of lime. This solution is known as *lime-water*, and is much employed both as a medicine and as a test for carbonic acid, which instantly renders it turbid, in consequence of the carbonate of lime that is formed being insoluble. It must, of course, be kept carefully guarded from the atmosphere, the carbonic acid of which would rapidly affect it. If in the preparation of slaked lime considerably more water is used than is necessary to form the hydrate, a white semi-fluid is produced, which is termed *milk of lime*. On allowing it to stand there is a deposition of hydrate of lime, above which is lime-water. Milk of lime is much used as a whitewash.

Lime prepared for building and other purposes by burning limestones in kilns often contains a considerable amount of impurity. But certain kinds of slightly impure are better than pure lime for making mortar. On the other hand, the lime which enters into the composition of plate and sheet glass, and which is used in some chemical industries, requires to be obtained from a nearly pure limestone. Chalk and white marble consist of almost pure carbonate of lime, but many of even the dark coloured limestones from different geological formations do not contain more than from 2 to 5 per cent. of foreign bodies, and these when burned generally yield a lime sufficiently pure for most purposes. Some limestones, again, contain from 20 to 30 per cent. of impurities, which commonly consist of silica, clay, magnesia, oxide of iron, and other bodies. These impure kinds often yield excellent hydraulic lime, which is very generally made by burning a limestone containing from 12 to 20 per cent. of silica, or of clay in which silica predominates. A less valuable hydraulic lime is prepared from a limestone containing a considerable amount of magnesia as well as clay. According to the absence or presence of foreign bodies, their nature and extent, limes are classed as (1) rich, fat, or pure lime; (2) impure or poor lime; and (3) hydraulic lime (see CEMENTS). When the percentage of magnesium carbonate in a limestone is high it is called a magnesian limestone, and this requires less fuel to burn it than a pure or nearly pure limestone. See DOLOMITE.

Besides the uses of lime noticed above, it is employed in the purification of coal-gas, in the unhairing of hides for tanning, in the preparation of stearic acid for candlemaking, for causticising alkalis, in the smelting of some metals, &c. Lime precipitates organic impurities from vegetable solutions containing sugar.

The following are the most important of the salts of lime. *Sulphate of lime* (calcium sulphate) is found native free from water, CaSO₄, as the mineral *Anhydrite* (q.v.), but more abundantly in the hydrated form, CaSO₄.2H₂O, as *Gypsum*. Sulphate of lime is a constituent of sea-water, and is also frequently present in drinking-water. For laboratory use a solution of sulphate of lime is made by shaking up the powder of burnt gypsum in water. See CALCIUM, and GYPSUM.

Carbonate of lime (calcium carbonate, CaCO₃) is abundantly present in both the inorganic and organic kingdoms. In the inorganic kingdom it occurs in a crystalline form in Iceland spar, Aragonite, and marble; while in the amorphous condition it forms the different varieties of common limestone, chalk, &c. It is always present in the ashes of plants, and it is the main constituent of the shells of crustaceans and molluscs, and occurs in considerable quantity in the bones of man and other vertebrates. See LIMESTONE; and BUILDING STONE, MARBLE.

Chloride of Calcium, CaCl₂, is a remarkably deliquescent substance and one of the most soluble

of salts on account of its great attraction for moisture. In the solid state it is much used for drying gases, and the pipes of freezing machines are filled with a solution of it to convey the low temperature produced to the cooling vessels.

There is a combination of lime with an organic acid—viz. oxalate of lime—which is of great importance in pathology as a frequent constituent of urinary calculi and sediments; for a description of it, see OXALIC ACID.

There are several compounds of phosphoric acid and lime, of which the most important is the *tribasic phosphate of lime* (tricalcium orthophosphate), sometimes termed *bone phosphate*, from its being the chief ingredient of bones. This phosphate is represented by the formula $\text{Ca}_3\text{P}_2\text{O}_8$, and occurs not only in bones, but also in the minerals apatite and phosphorite, and in the rounded nodules termed Coprolites (q.v.). It forms four-fifths of the ash of well-burned bone, the remaining fifth being chiefly carbonate of lime. This ash is known as *bone-earth*, and is employed as a manure and in the preparation of phosphorus, &c.

The soluble salts of lime give no precipitate with caustic alkalis, but yield a white precipitate with their carbonates. These reactions are also common to the salts of barium and strontium. Solution of sulphate of lime gives a white precipitate with the salts of barium and strontium. The most delicate test for lime is oxalate of ammonia, which, even in very dilute solutions, throws down a white precipitate of oxalate of lime. This precipitate is insoluble, except in mineral acids.

For the substance commonly designated as *chloride of lime*, see BLEACHING POWDER. For *lime as manure*, see MANURES.

Lime-compounds in Materia Medica.—*Quicklime*, in association with potash, either as the *Potassa cum calce*, or as *Vicenna Paste*, is occasionally used as a caustic. *Lime-water*, mixed with an equal quantity or an excess of milk, is one of our best remedies for the vomiting dependent on irritability of the stomach. From half an ounce to two or three ounces may be thus taken three or four times a day. Its use as a constituent of Carron oil in burns is noticed in the article LINIMENTS. *Chalk*, or *carbonate of lime*, when freed from the impurities with which it is often associated, is used as a dusting-powder in moist excoriations, ulcers, &c.; and, in the form of *chalk mixture* and *compound powder of chalk*, is a popular remedy in various forms of diarrhoea. A mixture of an ounce of precipitated carbonate of lime and a quarter of an ounce of finely-powdered camphor is sold as *Camphorated Crataegus Tooth-powder*.

Lime, or LINDEN (*Tilia*), a genus of trees of the natural order Tiliaceae, natives of Europe, the north of Asia, and North America. The species are very similar; graceful umbrageous trees, with deciduous, heart-shaped, serrated leaves, and cymes or panicles of rather small yellowish-green flowers; each cyme or panicle accompanied with a large, oblong, yellowish membranous bractea, with netted veins, the lower part of which adheres to the flower-stalk. The wood is light and soft, but tough, durable, and particularly suitable for carved work. It is much used by turners, and for making pill-boxes. The charcoal made of it is often used for tooth-powder. It is regarded by the makers of gunpowder as being superior to every other for their purpose; it is used also for medicinal purposes and for crayons. The use of the fibrous inner bark for making ropes, mats, and other plaited work is noticed in the article BAST. It is also used as a healing application to wounds and sores, being very mucilaginous, and abounding in a bland sap. The leaves are in some countries used as food for cattle, but cows fed on them

produce bad butter. The flowers have an agreeable odour, and abound in honey, much sought after by bees. The celebrated *Kovno Honey*, much valued for medicinal use and for making liqueurs, is the produce of great lime forests near Kovno, in Lithuania. The infusion and distilled water of the dried flowers are gently sudorific and antispasmodic. The former is in France a popular

Lime-tree (*Tilia europaea*):
a, a flower

remedy for catarrhs. The seeds abound in a fixed sweet oil. The European Lime, or Linden (*T. europaea*), often attains a large size, particularly in rich alluvial soils. Some botanists distinguish a small-leaved kind (*T. parvifolia* or *microphylla*) and a large-leaved (*T. grandifolia*) as different species; others regard them as mere varieties. The Hooded or Capuchin Lime is an interesting monstrous variety. The lime-tree is often planted for shade in towns; and the principal street of Berlin is called *Unter den Linden*, from the rows of lime-trees which line it. The lime is a very doubtful native of Britain, although indigenous on the Continent from Scandinavia to the Mediterranean. In Britain the lime-tree is generally propagated by layers. The American Lime (*T. americana*, or *T. glabra*), commonly called Basswood in America, has larger leaves than the European species. It abounds on the shores of Lakes Erie and Ontario. Other species take its place in more western and more southern regions.

Lime, the fruit of *Citrus Limetta*, similar to the Lemon (q.v.), but usually globular, with a nipple-like protuberance at the apex. It is regarded by many botanists as a hybrid between the orange and the lemon. There are many varieties, varying more or less in shape and size, and in the more essential characteristics of relative thickness, flavour, acidity, and juiciness of the rind and pulp. The tree varies as much in dimensions as the fruit, according to kind. It appears to have originated in the East, but in some of the varieties, such as the *Bergamotte lime* and *Adam's Apple*—which is often but erroneously confounded with the Shaddock (q.v.)—and others, it has been cultivated from the remotest times in Italy, the south of France, and the Mediterranean region generally. The uses of the fruit are the same practically as those of the lemon, the juice being equally efficacious as an antiscorbutic (see SCURVY).

Lime-light, light produced by a blowpipe-flame directed against a block of pure, compressed quicklime. The lime, which ought to be warmed beforehand, becomes brilliantly incandescent. The blowpipe-flame may be produced in various ways: (1) blowing oxygen through a spirit flame—light

obtained, about 150 candles; (2) oxygen under pressure, and coal-gas from the mains, brought in concentric tubes to a nozzle, where the mixture is burned in a fine jet-light, about 200 candles; (3) oxygen and coal-gas, both under pressure—light, about 400 candles; (4) the same, the coal-gas or the oxygen saturated with benzoline or ether or both benzoline and ether—light, up to 800 candles when both are employed; (5) warm oxygen, saturated with benzoline, gives light up to 1350 candles; (6) oxygen and hydrogen, up to about 800 candles. The mixed gases at the nozzle are explosive, and the greatest care must be taken to see that the flame is not allowed to run back or the mixture to take place elsewhere than at the nozzle. In the case where oxygen is saturated with combustible material the apparatus is so stuffed as not to allow an explosion to travel backwards in it. Lime-light was used on the stage as far back as 1837-38, but was improved in 1851-52. Thomas Drummond (q.v.) gave his name to an improved type.

Limerick, a county of the province of Munster, in Ireland, separated by the Shannon on the N. from Clare, and bounded E. by Tipperary, S. by Cork, and W. by Kerry. Its extreme length is 35 miles, its extreme breadth 54 miles; area, 680,842 acres, or 1063 sq. m. Pop. (1841) 330,029; (1861) 217,223; (1881) 180,632; (1891) 158,912, seven-eighths Catholics. It is an undulating plain, except on its extremities, north and south. The soil in general is fertile, especially the district called the Golden Vale, which comprises upwards of 150,000 acres, and a portion beside the Shannon below Limerick. Of the entire area 578,240 acres are in cultivation; 61 per cent. is grass-land, whilst barren soil and bogs cover only 6 per cent. Potatoes and oats are the principal crops, wheat and clover occupying the second place. Dairy-farming flourishes; woollens, flour, and paper are manufactured. The county returns two members to the House of Commons. Limerick is the only town of any size. The county formed part of the territory of Thomond, the principality of the O'Briens. After the English invasion it fell, after many vicissitudes, in great part to the Desmond Fitzgeralds—the confiscated estates of the last earl (1586) in Limerick containing 96,465 acres. Limerick is more than usually rich in antiquities, both ecclesiastical and civil, of the Celtic as well as the Anglo-Norman period. There are a great number of monastic ruins at Adare, Askeaton, &c. See the county history by Fitzgerald and McGregor (2 vols. Dublin, 1826-27).

Limerick, capital of Limerick county, Ireland, stands at the head of the estuary of the Shannon, 120 miles by rail WSW. of Dublin. It constitutes both a county of a city and a parliamentary borough, returning one member to parliament; previous to 1885 it returned two. The town consists of English Town, the original English settlement made in the reign of King John, on King's Island; Irish Town, which lies immediately to the south, on the left bank of the river; and Newtown-Pery, to the south of Irish Town, the newest and handsomest part of the city, dating from 1769. There are few objects of interest except the Protestant cathedral of St Mary, founded in 1180, and rebuilt in 1490; the Roman Catholic cathedral, a Gothic structure erected in 1860; and the fine bridges across the Shannon. Limerick manufactures a little lace, grinds flour, and cures bacon. Fourth among Irish seaports, it has a graving and a floating dock, and extensive quays; imports grain, petroleum, wine and spirits, and timber to the annual value of £683,000; the exports thence amount from £18,000 to *nil*. Pop. (1851) 53,448; (1881) 38,555; (1891) 37,155.

In the 9th century Limerick was an important Danish settlement, and remained so for two centuries longer; but the Danes were then expelled by the Irish. In 1174 the town fell into English hands. Breton made himself master of it in 1651. At the Revolution Limerick was the last stronghold of James II. in Ireland. William III. himself unsuccessfully assaulted it in 1690; but in the following year his general Ginkel had better fortune; the place was compelled to capitulate on 3d October. By the terms of the treaty of Limerick the bulk of the Irish army was permitted to enter the military service of France, and the Roman Catholics were guaranteed full religious and political liberty. The violation of the civil part of this treaty by the dominant Protestant party during the reigns of William III. and Anne, down to the 19th century, has given to Limerick the title of the 'City of the Violated Treaty.' See IRELAND, p. 205; and Linnæus's history of the town (1866).

Limestone, the popular as well as technical name for all rocks which are composed in whole, or to a large extent, of carbonate of lime. Few minerals are so extensively distributed in nature as this, and, in some form or other, limestone rocks occur in every geological system. Carbonate of lime is nearly insoluble in pure water, but it is rendered easily soluble by the presence of carbonic acid gas, which occurs in a variable quantity in all natural waters, for it is absorbed by water in its passage through the air as well as through the earth. Carbonate of lime in solution is consequently found in all rivers, lakes, and seas. In evaporation water and carbonic acid gas are given off, but the carbonate of lime remains uninfluenced, becoming gradually concentrated, until it has supersaturated the water, when a precipitation takes place. In this way are formed the stalactites which hang icicle-like from the roofs of limestone caverns, and the stalagmites which rise as columns from their floors. Travertine (Tiber-stone), or Calcareous Tufa (q.v.), is similarly formed in running streams, lakes, and springs, by the deposition of the carbonate of lime on the beds or sides, where it encrusts and binds together shells, fragments of wood, leaves, stones, &c. So also birds' nests, twigs, and other objects become coated with lime in the so-called petrifying wells, as that at Knarsborough. From the same cause pipes conveying water from boilers and mines often become choked up, and the tea-kettle gets lined with 'fur.'

While water is thus the great storehouse of carbonate of lime, very little of it, however, is fixed by precipitation, for in the ocean evaporation does not take place to such an extent as to permit it to deposit; besides, there is five times the quantity of free carbonic acid gas in the water of the sea that is required to keep the carbonate of lime in it in solution. Immense quantities of lime are nevertheless being abstracted from the sea, to form the hard portions of the numerous animals which inhabit it. Crustacea, mollusca, zoophytes, and foraminifera are ever busy separating the little particles of carbonate of lime from the water, and solidifying them, and so supply the materials for forming solid rock. It has been found that a large portion of the bed of the Atlantic between Europe and North America is covered with a light-coloured ooze, composed chiefly of the perfect or broken skeletons of foraminifera, forming a substance, when dried, which in appearance and structure closely resembles chalk. In tropical regions corals are building reefs of enormous magnitude, corresponding in structure to many of the limestones met with in various geological systems.

The chief varieties of limestone are *Chalk* (q.v.); *Oolite* (q.v.); *Compact Limestone*, a hard, smooth,

fine-grained rock, generally of a bluish-gray colour; *Crystalline Limestone*, a rock which, from metamorphic action, has become granular; fine-grained white varieties, resembling loaf sugar in texture, called *Saccharine* or *Statuary Marble*. Particular names are given to some limestones from the kind of fossils that abound in them, as Nummulite, Hippurite, and Crinoidal limestones; or the presence of impurities or admixtures of other mineral matter may give rise to varieties, as argillaceous, ferruginous, siliceous, carbonaceous, and magnesian limestones. Hydraulic limestones contain a certain proportion of silica and alumina which forms a mortar that sets in water. Many limestones, again, derive their name from the system to which they belong, as Silurian, Devonian, Carboniferous, Jurassic, &c.

Lime-tree. See LIME.

Limfjord. See DENMARK.

Limitation is a term used, in English law, in two senses: (1) A *limitation of property* is a form of words used in a deed or will to mark out the extent of the interests given. Thus, if land be granted to A and his heirs, the words 'and his heirs' are words of limitation; they indicate that an estate of inheritance is given to A.

(2) *Limitation of Actions*.—To protect persons in possession of property, and to prevent the raking up of old disputes, a time is fixed within which actions must be brought. An action to recover land must be brought within twelve years; if the owner allows that time to elapse without asserting his right his title is taken away. Actions to recover debt or damages must be brought within six years; for assault, within four years; for slander, within two years. In Scotland actions to recover land must be brought within forty years; for ordinary debts, within three years; and for bills of exchange, within six years. See PRESCRIPTON; and Boswell's *Statute of Limitations, with English Acts* (Boston, 1889).

Limited Liability. See COMPANY.

Limits, METHOD OF. See CALCULUS.

Limma, an interval which, on account of its exceeding smallness, does not appear in the practice of modern music, but which, in the mathematical calculation of the proportions of different intervals, is of the greatest importance. The limma makes its appearance in three different magnitudes—viz. the great limma, which is the difference between the large whole tone and the small semitone, being in the proportion of 27 to 25; the small limma, which is the difference between the great whole tone and the great semitone, being in the proportion of 135 to 138; and the Pythagorean limma, which is the difference between the great third of the ancients (which consisted of two whole tones) and the perfect fourth, the proportion of which is as 256 to 243.

Limnaeus (Gr. *limne*, 'a swamp'), a genus of pulmonate Gasteropods, living in fresh water in all parts of the world, and feeding on vegetable matter. The shell is thin and pale, capable of containing the whole animal when retracted in danger or buried in the mud during drought. It is a somewhat elongated spire in Limnaeus, coiled in one plane in the allied genus Planorbis, and limpet-like in Ancyclus. An anatomical peculiarity of interest in the adult animal is the persistence on the head region of a structure directly derived from the embryonic 'velum' (see GASTEROPDS). Limnaeus and other fresh-water snails often float and glide shell downwards at the surface with the foot expanded like a boat, the lung sac being partly used as a hydrostatic apparatus. Semper has made numerous experiments on Limnaeus, showing how

they vary in relation to their surroundings. Thus, he was able to rear a dwarf brood by keeping them in confined vessels. Most fresh-water snails come to the surface periodically to breathe the air directly, and then return to their grazing-grounds beneath; some are said to utilise the air-bubbles on water-plants; while others have become adapted to deep water, remain at the bottom, and use skin and lung-chamber as substitutes for gills. More over, in the young forms the lung sac at first contains water. The eggs, enveloped in a glairy substance, are laid on stones or aquatic plants, and afford convenient opportunities for the study of development. Limnaeus is a useful inmate of a fresh water aquarium, keeping the water clean and unchoked by algae. The numerous and prolific species perform a similar function in ponds and streams, and furnish food for fishes and birds. They are often infested by parasites, of which many complete their life-history in higher hosts. Thus, *Limnaeus stagnalis* lodges for a while the Liver-fluke (q.v.) of the sheep.

Limnoria. See BORING-ANIMALS.

Limoges, capital of the French department of Haute-Vienne, and of the former province of Limousin, is picturesquely situated on the Vienne, by rail 248 miles S. by W. of Paris and 218 N. of Toulouse. Its most imposing building is the Gothic cathedral, begun in the 13th century and completed in 1851. The staple industry is the manufacture of porcelain, which employs more than 5000 people. One-half of this product is exported annually to America. The enamel-work, for which Limoges was formerly celebrated, is now no longer carried on. There is a fine ceramic museum (1867). The manufacture of flannel, cotton, paper, &c. are the chief secondary industries. Pop. (1826) 48,862; (1891) 67,817. Limoges was the birthplace of D'Aguesseau, Vergniaud, and Marshals Jourdan and Bugeaud. It was an important town under the Romans, and in spite of plagues, fires, and sieges (the worst that by the Black Prince in 1370), from all of which it has suffered severely, it is still a place of note. It had its own mint from the 4th century down to 1837.

See an article in *Harper's Monthly* for October 1888; the article EXAMEL; and Rupin's *L'Œuvre de Limoges* (1890).

Limon, a port of Costa Rica, founded in 1861, on the Caribbean Sea. The railway begins here, and the place has a landing-pier. There are considerable exports from this place of coffee, caoutchouc, cocoa-nuts, sarsaparilla, vegetables, wood, and hats. Pop. 1400.

Limonite, or BROWN IRON ORE, hydrous ferric oxide. This mineral occurs most frequently in the form of fibrous aggregates, or earthy and amorphous masses, and never in that of definite crystals. It has a hardness of 5.5, a specific gravity of 3.3-3.9, and a yellowish-brown streak. It is the yellow colouring matter of chalybeate springs. Rocks containing iron are often stained brown or yellow from the conversion of the iron into limonite.

Limousin, or LIMOSIN, LEONARD, painter in enamel, was born *cæca* 1505, and flourished from 1532 to 1571 at the French court. He was one of the Limousin school of enamellers. See EXAMEL.

Limpet (*Patella*), a genus of Gasteropod Molluscs, in the Zygobranch section. The animals are most familiar objects between tide marks on rocky coasts, are covered by a conical shell, with the apex directed slightly forward, and remain firmly fixed when the tide is out, adhering by the large oval or circular 'foot,' which acts like a vacuum-sucker on the rock. How firmly they adhere, unless

taken by surprise, every wanderer on the shore has tested, yet the 'oyster-catcher' (*Haematopus*) manages with adroitness to detach them. They move slowly about under water, browsing on crustacean seaweeds with the help of a peculiarly long 'radula' or rasping ribbon, which in the common limpet (*P. calyparus*) is much longer than the body, and bears 160 rows of teeth, 12 in each row, 1920 in all. It is noteworthy that the limpets show a certain local memory, for they return after a short journey to their old resting-places, which, after prolonged usage, may be marked by distinct depressions, especially if the rock be calcareous. The gills form a circle of leaflets between the foot and the edge of the mantle; the internal structure is complex after the fashion of gasteropods; the sexes are distinct, and breed in spring. Limpets are occasionally used for food, but oftener for bait. A species found on the western coast of South America has a shell a foot wide, which is often used as a basin. There are numerous species of *Patella*, and many allied genera, though it is not yet demonstrated that all the forms usually associ-

ated with *Patella* deserve the place which their shells and rasps suggest. The key-hole limpets (*Fissurellidae*) form an adjacent family, marked externally by a hole at or near the apex of the shell, or by a notch on the anterior margin. Another externally similar but more remote set of 'limpets' are united in the family *Acanthidae*, of which *Acanthia testudinaria* is very common on the northern coasts of North America. They are often called 'slipper-limpets,' from the presence of an internal flange on the incipiently spiral shell, and are generally attached, sometimes as commensals, to other molluscs. The genera *Calyptrea* and *Crucibulum*, nearly related to the above, are known as 'cup and-saucer limpets.' For anatomy, see R. J. Harvey Gibson, *Transactions Royal Society, Edin.*, 1884-85.

Limpopo. See OORI.

Limulus. See KING-CRAB.

Linaere. OF LYNAKER.

THOMAS, physician and scholar, was born at Canterbury about 1160, studied at Oxford, and was elected Fellow of All-Souls' College in 1484. Shortly afterwards he went to Italy, where he learned Greek from Chalcondylas and studied under Politian; he graduated in medicine at Padua. About 1501 Henry VII. made him tutor to Prince Arthur and king's physician. This latter office he continued to fill during the reign of Henry VIII. At the same time he practised in London; he also founded the Royal College of Physicians. Late in life he entered the church and held several benefices. He died 20th October 1524. Linaere was one of the earliest champions in England of the New Learning. He translated several of the works of Galen into Latin that was praised for its elegance and purity, and wrote some grammatical treatises the most important, *De Emendata Structura Latini Sermonis* (1524). See Life by Dr Noble Johnson (1835).

Linares. a town of southern Spain, 90 miles by rail ENE. of Cordova, is celebrated for its mines of lead and copper, which yield 40,000 to 50,000 tons of argentiferous ore annually. There are in the town lead and iron foundries, and gunpowder and dynamite factories. Pop. 31,000.

Lincluden. a ruined abbey, $\frac{1}{2}$ mile NNW. of Dumfries, at the Cluden's influx to the Nith. It was founded about 1164 for Benedictine nuns. See McDowall's *Chronicles of Lincluden* (1886).

Lincoln. a city of England, the capital of Lincolnshire, and a parliamentary county, and municipal borough, is situated on the Witham, 42 miles S. of Hull, 33 NE. of Nottingham, and 130 N. by W. of London. Built on the slope of a hill, which rises 210 feet above the river, and is crowned by the cathedral, the city is imposing in effect, and can be seen from afar in the flat fen-country. It is very ancient, is irregularly laid out, and contains many interesting specimens of early architecture—notably the castle, commenced in 1086 by William I.; the Newport Gate, or Roman arch, on the north side of the city; the Exchequer and Stonebow gateways, the latter supporting a guildhall of medieval architecture; the Jew's House (Norman), associated with the legend of Hugh of Lincoln (q.v.); St Mary's Guild (Norman); and the middle grammar-school (to which additions have recently been made), founded in 1567 in the Grey Friars. But

Lincoln Cathedral.

the chief glory of Lincoln is its cathedral, admittedly one of the finest in England. Erected between 1075 and 1501, it measures 524 feet by 82 (or 250 across the transepts), and in style is mainly Early English. Its matchless central tower (1235-1311, and 265 feet high) was previous to 1547 surmounted by a spire, as till 1808 were the two western towers (completed 1150). Other noticeable features are the west front (partly Norman), with its three doorways (1123); the Galilee or south porch (*circa* 1210); the Decorated choir (1254), with its rich sculpturing; the decagonal chapter-house (restored since 1888); Norman font (1075-93); and Great Tom of Lincoln (see article BELL), hung in the central tower, which also contains a mellow-chiming clock (1880). Besides the cathedral, there are fourteen churches of various dates, a county hall (1823-26), theological college, school of science, and bishop's palace (1886-87) embodied with a former palace of 1119. Several iron-foundries and important manufactories of agricultural machinery are in operation here, and an active trade is done in flour. The horse-fair, held annually in the spring, is one of the largest in the world,

and the race-meetings, which take place on the Carholme, date back to at least the reign of James I. One member is returned to parliament for the city, which, moreover, is the depot of the Lincolnshire regiment, and gives the inferior title of earl to the Duke of Newcastle. In the history of Lincoln the most noteworthy incidents have been frequent invasions by the Danes (786-875); great fires (1110 and 1124); a battle (1141) between the adherents of Stephen and the Empress Matilda during their struggle for the English crown; the second coronation of Henry II. (1155-58); an earthquake (1185), which did much damage, especially to the cathedral; the battle of Lincoln, or Lewis Fair, fought 4th June 1218; five parliaments held here between 1301 and 1386; six royal visits; and lastly, the siege of the town, and desecration of the cathedral, by the parliamentarians under the Earl of Manchester (1644). Among the sixty-four bishops of Lincoln were Remigius, who in 1073 transferred the see hither from Dorchester in Oxfordshire; St Hugh of Avalon; Robert Grosseteste; Cardinal Beaufort; Fleming and Smith, the respective founders of Lincoln and Brasenose colleges at Oxford; Cardinal Wolsey; Tenison and Wake, afterwards archbishops of Canterbury; Thurlow, a brother of the Lord Chancellor; and Christopher Wordsworth, the founder of the theological college. Pop. (1801) 7,398; (1831) 11,873; (1881) 37,313; (1891) 43,983. See the works cited at the article LINCOLNSHIRE.

Lincoln. (1) capital of Nebraska, stands in a fertile prairie country, on Salt Creek, 66 miles by rail SW. of Omaha. Laid out in 1867, it is a handsome and thriving city. The public buildings include the state capitol, university, prison, and insane asylum, and the United States court-house. There are numerous manufactories; limestone is largely quarried, and there are great salt works near. Pop. (1880) 13,003; (1890) 55,154.—(2) A town of Rhode Island, 6 miles N. of Providence, comprising several cotton manufacturing villages. Pop. (1890) 20,355.—(3) Capital of Logan county, Illinois, 28 miles NNE. of Springfield, manufactures farm-implements, and is the seat of Lincoln University (Cumberland Presbyterian) and of an imbecile asylum. Pop. 6725.

Lincoln, Mount, a peak of the Rocky Mountains, in Colorado, about 8 miles NE. of Leadville, reaching a height of 14,297 feet. A railway has been constructed to the silver-mining works at the summit, and here is a meteorological station conducted by Harvard College, another station being placed at a lower level (13,500 feet).

Lincoln, ABRAHAM, sixteenth president of the United States, was born in Hardin county, Kentucky, 12th February 1809. He was descended in the sixth generation from Samuel Lincoln, who emigrated from Norwich in England to Massachusetts about 1638. Samuel's grandson removed to Berks county, Pennsylvania, and died there in 1735. The family history henceforward marks the advancing wave of settlements, first south-westward, skirting the eastern slope of the Alleghanies, then surmounting these mountains and spreading over the Ohio valley. Samuel's great-grandson rested in Virginia; his son, Abraham, followed the pioneer Daniel Boone to Kentucky, and while clearing a farm in the forest was killed by Indians in 1784. Abraham's son, Thomas, then but six years old, grew up without education, and in 1806 married Nancy Hanks of the same pioneer stock. Abraham, the future president, was their second child, but lost his mother before he was ten years old. His restless father had crossed the Ohio in 1816, and made a new home in the forests of

Indiana, just before its admission as a state. In 1819 he brought from Kentucky a second wife, Sarah (Bush) Johnston, a worthy woman, who trained her step-children as faithfully as her own. Abraham learned the little that was taught in the backwoods schools, and was employed in rough farm-work until at the age of nineteen he took on a flat-boat a cargo to New Orleans. His first close view of slavery made a lasting impression on his mind.

When Lincoln was twenty-one his father removed to central Illinois, where the son assisted in felling trees, building another log-cabin, and splitting rails for fences. After a second trading voyage to New Orleans he returned to be a clerk in a country store at New Salem, Illinois. When the Indian chief Black Hawk disturbed the northern part of that state in 1832 Lincoln served a few weeks as captain in an uneventful campaign. Being defeated as a candidate for the legislature, he purchased a small store, but its failure left him burdened with debt. However, he was made village postmaster, and also deputy to the county surveyor, and the light duties allowed him time to study law and grammar. Elected to the legislature in 1834, he served until 1842, when he declined further nomination. He had become leader of the Whigs, and was influential in having the state capital removed in 1839 from Vandalia to Springfield, where he had fixed his residence. Thither, too, came Mary Todd (1818-82), the daughter of Robert Todd of Lexington, Kentucky, and in November 1842 she was married to the rising lawyer. In 1846 Lincoln was elected to congress, but his service was limited to a single term. Professional work was steadily drawing him from interest in politics when in 1854 Stephen A. Douglas, by his Kansas-Nebraska bill, repealed the Missouri Compromise of 1820, and reopened the question of slavery in the territories. The bill roused intense feeling throughout the North, and Douglas resolved to defend his position in a speech at the state fair at Springfield in October. Lincoln, invited by his Whig friends to reply, delivered on the same day a speech which first fully revealed his power as a political debater. Against his wish 'Honest Abe' was then elected to the legislature, and the Whigs of that body endeavoured to send him to the United States senate, but finally at his request joined in electing Lyman Trumbull, an anti-Douglas Democrat. When the Republican party was organised in 1856 to oppose the extension of slavery Lincoln was its most prominent leader in Illinois. At its first national convention in the same year the delegates of his state presented him as a nominee for the vice-presidency. But he did not attain a national reputation until 1858. Then Douglas, seeking re-election to the United States senate, began a canvass of Illinois in advocacy of his views of 'popular sovereignty.' Lincoln, as candidate for the same position, arranged with Douglas for a series of debates. The contest attracted the attention of the whole country; but though the general verdict was in favour of Lincoln and his cause, the peculiar arrangement of the legislative districts gave Douglas the immediate advantage, and secured his election.

In another memorable oration in the Cooper Union, New York, in February 1860, Lincoln proved that the founders of the republic had desired the restriction of slavery. In May of that year the Republican convention was held in Chicago, and on the third ballot nominated him for the presidency. The Democratic party held its convention in Charleston, but was unable to agree on a candidate. Douglas was nominated by one wing, Breckinridge by the other. After an intensely exciting campaign Lincoln received a

popular vote of 1,866,462; Douglas, 1,375,157; Breckinridge, 847,953; and Bell, 590,631. Of the electors Lincoln had 180; Breckinridge, 72; Bell, 39; and Douglas, 12.

The pro-slavery leaders forthwith put in execution their plans for the secession of their states. South Carolina moved first, and with the six Gulf states formed, in February 1861, the Confederate States of America. Lincoln, leaving Springfield on 1st February, passed through the principal northern cities, making brief addresses at various points, and reaching Washington on the 24th. His inaugural address on 4th March declared the Union perpetual, argued the futility of secession, expressed his determination that the laws should be faithfully executed in all the states, deprecated the impending evils, and made a touching appeal to all friends of the Union. Of the seven members of Lincoln's cabinet four had been Democrats, three Whigs; two were from border slave-states. The chief places were given to W. H. Seward of New York (secretary of state), and Salmon P. Chase of Ohio (secretary of the treasury). Edwin M. Stanton was made secretary of war in 1862.

On April 12, 1861, the Confederate general Beauregard attacked Fort Sumter in Charleston harbour. The civil war being thus commenced, Lincoln called a special session of congress, summoned 75,000 militia for three months, and ordered the enlistment of 65,000 regulars for three years. He proclaimed a blockade of the southern ports, and endeavoured to make it effective. The Southern Confederacy soon had control of eleven states, and put in the field 100,000 men. The first important battle was fought at Bull Run, Virginia, July 21, 1861, and resulted in a disgraceful rout of the Union army. Further account of the military and naval events of the war belongs to general history. The struggle which sanguine statesmen predicted could be ended in a few months was prolonged over four years, with dreadful sacrifices of men and means. Foreign intervention, which seemed imminent at the outset, was with difficulty averted. After sixteen months, in which the disasters to the Union army had outnumbered the victories, Lincoln declared to Horace Greeley the line of his conduct: 'My paramount object is to save the Union, and not either to save or destroy slavery. If I could save the Union without freeing any slave, I would do it; if I could save it by freeing all the slaves, I would do it; and if I could do it by freeing some and leaving others alone, I would also do that.' One month later the time had come for decision, and on September 22, 1862, just after McClellan's victory at Antietam, Lincoln proclaimed that on and after January 1, 1863, all slaves in states or parts of states then in rebellion should be free. On the following New-year's Day the final proclamation of emancipation was made. This greatest achievement of his administration, wrung from him by the exigencies of civil war, was completed and made immutable by the passage of the Thirteenth Amendment of the Constitution, which he planned and urged, though it was not fully ratified until December 1865.

In July 1863 Grant's capture of Vicksburg restored to the Union full control of the Mississippi River, while Meade's defeat of Lee at Gettysburg destroyed the last hope of the Confederates to transfer the seat of war north of the Potomac. In November of that year, at the dedication of the National Cemetery at Gettysburg, Lincoln delivered a brief address, closing with these words: 'We here highly resolve that these dead shall not have died in vain that this nation, under God, shall have a new birth of freedom and that government of the people, by the people, for the people, shall not perish from the earth.'

General Grant was called to the chief command of the Union army in March 1864, and entered upon that policy of persistent attrition of the Confederate forces which finally brought peace. In the Republican Convention at Baltimore in June Lincoln was unanimously nominated for a second term. The Democrats at Chicago in August declared the war a failure, yet nominated General McClellan. In November Lincoln received of the popular vote 2,216,000, and McClellan 1,800,000; of the electoral votes Lincoln had 212, McClellan 21. In his second inaugural address, in March 1865, Lincoln rose above the ordinary range of such occasions, and like an inspired prophet set forth the profound moral significance of the tremendous war which he saw drawing to a close. A month later he had entered Richmond, from which Grant had driven Davis and Lee. Lincoln returned to Washington to consider the new problems presented by the overthrow of the Confederacy. But his work was already finished. While seeking relaxation with his family at Ford's Theatre he was assassinated by J. Wilkes Booth, an actor, and died on the next morning, April 15, 1865. The national rejoicing over the return of peace was turned into grief for the martyred president. The whole civilised world joined in expression of sorrow for his fate.

Lincoln was 6 feet 4 inches in height, with long limbs and large hands and feet, dark complexion, broad, high forehead, deep-set gray eyes, and coarse black hair. He was slender, wiry and strong, mild and patient, fair and direct in speech and action, scorning all tricks and subterfuges, steadfast in principle, sympathetic and charitable. He was a man of strict morality, abstemious, and familiar with the Bible, though not a professed member of any church. His public life was devoted to the good of his fellow-men, and his fame is established as the saviour of his country and the liberator of a race.

Of his four sons, Robert Todd Lincoln, born August 1, 1843, was the only one to reach manhood. He was secretary of war in the years 1881-85, and was United States minister to England in the years 1889-93.

See Arnold, *The Life of Abraham Lincoln* (1885); Herndon and Weik, *The History and Personal Recollections of Abraham Lincoln* (3 vols. 1889); Nicolay and Hay, *Abraham Lincoln: A History* (10 vols. 1891); J. T. Morse, *Abraham Lincoln* (2 vols. 1893).

Lincoln, BENJAMIN, an American general, was born at Bingham, Massachusetts, 24th January 1733; in 1776 reinforced Washington after the defeat on Long Island, and served with him that year; in 1777 was appointed major-general, was wounded in October, and disabled until the following August; then received command of the southern department, and in 1780 was besieged by Clinton in Charleston, and compelled to capitulate. He was exchanged a year later, took part in the siege of Yorktown, and was deputed to receive Cornwallis' sword. He was secretary of war from 1781 to 1784, and died 9th May 1810.

Lincolnshire, a maritime county of England, and, after Yorkshire, the largest in the country, is bounded on the N. by the estuary of the Humber; E. by the North Sea, the Wash, and Norfolk; S. by Cambridge, Northampton, and Rutland shires; and W. by Leicester, Nottingham, and York shires. Measuring 75 miles from north to south and 48 miles from east to west, it has a seaboard of about 90 miles, and contains 2672 sq. m., or 1,767,879 acres. Pop. (1801) 208,557; (1881) 469,919; (1891) 472,878. The surface is comparatively flat; along the coast stretches a line of low-lying marshes, varying in breadth, from which in places the sea is

only kept out by means of earthen embankments. To the west of these marshes lie the Wolds, a range of chalk downs, which, commencing near Barton-on-Humber in the north, extend thence in a south-easterly direction for about 40 miles to the neighbourhood of Spilsby and Horncastle. The western side of the county, from the Humber in the north through Lincoln to Grantham in the south, consists principally of light uplands, whilst in the south-east are fens forming part of the Bedford Level (q.v.). The efforts to drain the Fens and the Isle of Axholme encountered great opposition from the 'stilt-walkers,' from the reign of Charles I. down to the first quarter of the 18th century. The chief rivers of Lincolnshire, besides that which forms its northern boundary, are the Trent, Witham, and Welland; and a noticeable feature of the county are the numerous canals which intersect it—Car-dyke and Foss-dyke, the two largest, being probably the work of the Romans. Clay, sand, loam, chalk, or peat, varying with the locality, are the prevailing soils. Near Ancaster limestone is extensively quarried, and in the western districts ironstone abounds. The chief crops are corn and turnips, and in places flax is cultivated; but from an agricultural point of view the county is best known for its rich 'warp-lands' along the banks of the Trent, and for the immense flocks of sheep grazed on its pastures. Horse-breeding, too, is extensively prosecuted, the horse-fairs at Horncastle and Lincoln attracting many foreign and London dealers; and amongst other industries may be noted the manufacture of agricultural implements and machinery, and the great shipping trade and fisheries connected with the port of Grimsby.

Lincolnshire is divided into three districts or 'Parts,' as they are called—viz. the Parts of Holland in the south-east, comprising the greater part of the Fens, the Parts of Kesteven in the south-west, and the Parts of Lindsey, which is by far the largest, occupying the remainder of the county. These Parts, each of which has its own county council, are subdivided into thirty-one wapentakes or hundreds, the city of Lincoln and the municipal boroughs of Boston, Grantham, Great Grimsby, and Louth, with part of that of Stamford (the remainder being in Northamptonshire), and contain in all 757 parishes, almost entirely situate in the diocese of Lincoln and midland circuit, the assizes being held at Lincoln. For parliamentary purposes the county is divided into seven divisions, and the boroughs of Boston, Grantham, Grimsby, and Lincoln, each of which returns one member. Other towns are Cleethorpes (practically a suburb of Grimsby), Gainsborough, Sleaford, Spalding, and Sutton.

The history of the county apart from Lincoln is soon told. It was here that in 1536 first broke out the insurrection known as the 'Pilgrimage of Grace,' which had for its object the restoration of popery and re-establishment of dissolved monasteries; and in 1643, during the Civil War, Ancaster, Gainsborough, Grantham, and Winceby were the scene of contests between the rival forces. To the antiquary Lincolnshire is of special interest on account of the beauty of its many churches—Boston, Crowle, Grantham, Heckington, Louth, Long Sutton and Tattershall amongst them; whilst of other places of interest it will suffice to mention here the ruined abbey of Crowland, and Bolingbroke Castle (of which but little remains), the home of John of Gaunt and of his son Henry IV., who was born there. Other eminent persons associated with the county include John Foxe, the martyrologist; William Cecil, Lord Burghley; Captain John Smith; Archedbishop Whitgift; Heywood, the dramatist; Sir Isaac

Newton; Thomas Sutton, founder of the Charterhouse; Dr Busby, head-master of Westminster; John Wesley; Scott, the commentator; Sir John Franklin; Dr Dodd, the forger; Dr Lingard; Lord Tennyson; and Professor Conington. See works by Allen (2 vols. 1834) and Sir Charles Anderson (1880), and Murray's *Handbook to Lincolnshire* (1890).

Lincoln's Inn. See INNS OF COURT.

Lincrusta, a decorative material invented by Walton (see FLOORCLOTH), is a compressed sheet of cellulose, paper, cork, &c., impregnated with linseed oil and resin, and while still plastic, impressed with moulds so as to make raised patterns. It is tough, leathery, impervious to water, and much cheaper than embossed leather.

Lind. JENNY. See GOLDSCHMIDT, MADAME.

Lindau. PAUL, man of letters, was born on 3d June 1839 at Magdeburg. He trained himself for journalistic work in Paris, returned to Germany in 1863, and has since edited various journals, including *Die Gegenwart* and *Noch und Noch*, both of which he founded. He has laboured in three or four other fields of literary activity. Amongst the earliest fruits of his industry were the pleasantly-written books of travel, *Aus Frankfurt* (1864) and *Aus Paris* (1865), and later *Aus der Neuen Welt* (1884). His skill as a writer of critical sketches (in a satirical and humorous manner) is shown in *Humoreske Briefe eines deutschen Kleinwüchters* (1870) and *Literarische Rücksichtslosigkeiten* (1871), and his calibre as a literary critic in studies on *Molière* (1871) and *Alfred de Musset* (1877), and in *Dramaturgische Blätter* (1875-78), *Nächterliche Briefe aus Baiern* (1st and 7th ed. 1876), *Bauernliche Briefe* (5th ed. 1883), and *Anfänge* (1875). But he is perhaps better known as a writer of plays and novels, the subjects of which are taken almost exclusively from modern life. The former possess the merits of lively dialogue and a fair degree of dramatic power; the most successful was perhaps *Maria und Magdalena*. A collection of his theatrical pieces was published in three volumes as *Theater* (1873-81). The novels include *Herr und Frau Bauer* (7th ed. 1882), *Tuppelburg* (3d ed. 1883), *Maja* (5th ed. 1884), a romance cycle, *Berlin* (1886-90), and *Der Bräuer* (1894). He has written works of travel, and in 1895 became manager of the court theatre at Meiningen.

Lindley. JOHN, botanist, was born on 5th February 1799 at Catton, near Norwich. His father, the author of *A Guide to Orchard and Kitchen Gardens*, owned a nursery garden. Botany attracted young Lindley's attention at an early date. When little more than twenty he went to London, and wrote for the *Encyclopædia of Plants*. In 1822 he was appointed assistant-secretary to the Horticultural Society, and in 1829 professor of Botany in University College, London. He retired from this chair in 1860, and died at Turnham Green on 1st November 1865. His works include the *Synopsis of British Flora* (1820); *Introduction to the Natural System of Botany* (1830); *Outline of the Structure and Physiology of Plants* (2 vols. 1832); *Flora Medica* (1838); *The Vegetable Kingdom* (1846), a standard work on the subject of classification; and *Theory and Practice of Horticulture* (2d ed. 1855). Along with W. Hutton he published *The Vessel Flora of Great Britain* (3 vols. 1831-37).

Lindsay, a Scottish historical house of Norman extraction. Sir Walter de Lindsay, settling in Scotland under David I., acquired Errolton in

Berwickshire, and Luffness in East Lothian. His descendant, William Lindsay, Justiciary of Lothian in the 12th century, acquired Crawford in Clydesdale, married Princess Marjory, sister of King William the Lion, and had three sons. The two elder lines of these ended in heiresses, and Crawford eventually came to the descendants of William of Luffness, the third son.

Earls of Crawford and Duke of Montrose.—Sir Alexander Lindsay, younger brother of Sir James of Crawford, the hero of Otterburn, acquired Glenesk and Edzell, and his son David married the sister of Robert III., and was created in 1398 Earl of Crawford. Their chief seat was Finhaven, in Angus. The family attained its climax of power under David, fifth earl, who was made Duke of Montrose in 1488. The grand-nephew of the duke was known as 'The Wicked Master;' and his conduct led his father to transfer the earldom to David Lindsay of Edzell, the next heir. He, however, left it at his death to the son of the 'Wicked Master.' This line ended in the sixteenth earl, and by arrangement, Lord Lindsay of the Byres succeeded to the earldom of Crawford in preference to the descendants of the uncle of the sixteenth earl, who had been created Lord Spynie, and the intermediate cadets of Edzell and Balarres.

Lord Lindsay of the Byres, Viscount Garnock.—Sir William Lindsay, younger brother of the first Earl of Crawford, acquired extensive estates with his wife, a daughter of Sir William Muir of Abercorn. His grandson was made Lord Lindsay of the Byres, county Haddington, in 1445, but their principal residence was Struthers Castle in Fife. The tenth lord was in 1644 created Earl of Lindsay; and, as stated above, under a new patent of Charles I. he became seventeenth Earl of Crawford. He was High Treasurer of Scotland. His grandson by a younger son was created Viscount Garnock in 1703. The fourth Viscount Garnock succeeded as twenty-first Earl of Crawford; and his son, the twenty-second Earl, dying in 1808, was the last of the direct line of the Byres.

Earls of Balarres and Crawford.—The Lindsays of Balarres, in Fife, were a branch, and eventually the representatives, of the Lindsays of Edzell. The first was Lord Menmuir, Secretary of State to James VI. His son David was created Lord Lindsay of Balarres in 1633, and his grandson, Alexander, Earl of Balarres in 1651. On the death of the twenty-second Earl of Crawford, James, seventh Earl of Balarres, became twenty-third Earl of Crawford. A further claim was preferred without success to the dukedom of Montrose, conferred by James III., by the late Earl of Crawford (q.v.). See his *Lives of the Lindsays* (1849), and Jervise's *Land of the Lindsays* (2d ed. 1882).

Lindsey, THEOPHILUS (1723-1808), one of the first English Unitarians (q.v.), was a native of Middlewich, Cheshire, a Fellow of St John's College, Cambridge, an Anglican clergyman till 1773, and author of several works. See his *Memoirs* by Belsham (1812).

Line, BREAKING THE. See CLERK, JOHN; and TACTICS, NAVAL.

Linens. Flax, like wool, has been used as a material for woven fabrics from a very remote period. Not only are there frequent references to linen in the Bible and other ancient records, but, owing to the wonderful durability of the fibre, many linen mummy-cloths of great age and some of extremely fine texture have been found in Egypt. That country must have been long celebrated for

its linens, because it is known that some of the finest sorts used by the ancient Greeks and Romans were woven on Egyptian looms. Just before the Christian era the cultivation of flax was extensive in Italy, and it was probably by the Romans that the growth of flax for textile purposes was introduced into Britain. Since that time the art of spinning and weaving this fibre by primitive methods has no doubt been continuously practised in countries that were occupied by the Romans, and at all events it can be traced over the greater part of Europe from the 6th or 7th century, till in comparatively recent times it almost entirely ceased to be a domestic industry, and became located in certain centres as an important textile manufacture. Interesting specimens of figured stuffs, such as Damask (q.v.), composed entirely of linen and also of silk and linen, and made in Italy and Spain as early as the 14th century, may be seen in one or two industrial art museums in England and on the Continent. The ground of the celebrated Bayeux Tapestry (q.v.), made in the 11th century, is of linen, which, by means of careful cleaning, is now of an almost snow-white colour.

Flanders seems to have acquired some celebrity for the weaving of table-linen as early as the 11th century, and from that time till long afterwards Flemish weavers were occasionally settling in England. Among the Huguenots, who in the 17th century sought refuge in England and other countries, were many workmen skilled in the making of linen fabrics, and these artisans did much to help this and other industries wherever they settled. A government board of manufactures was established in Ireland in 1711, and another in Scotland in 1727, both of which, by a system of bounties, encouraged the linen trade in several ways. In England the linen manufacture was also assisted by bounties, which did not finally cease till 1832. The year 1787 marks the first introduction of a mill for spinning linen-yarn by machinery in the United Kingdom. It was built at Darlington, and the patentees of the machines were J. Kendrew and T. Porthouse. In Scotland the first flax spinning-mill was erected near Glamis in 1790, and one or two others were set agoing in Fife very soon afterwards. Although the power-loom of Cartwright was applied to the weaving of cotton in 1785, it was not till 1812 that the first factory, which had any real success, for weaving linen by power, was established by C. Turner & Co. of Limehouse, London. Speaking generally, the improvements in the machines for spinning and weaving cotton have been more rapid than in those employed for the manufacture of linen.

Heckling.—The preparation of the fibre of the flax plant into the state in which it is sent to spinning-mills is described under the heading FLAX. At the mill it gets a rough sorting, and is then heckled, a process which has been in use for centuries. A hand heckle is an oblong stock of wood studded with strong steel teeth about 7 inches long in the case of the first or 'ruffer' heckle. The heckler takes a handful or strick of flax by the middle and draws the root end several times through the teeth. He then turns the strick, and in the same way heckles the opposite end. The flax is next similarly treated on a heckle with finer teeth, and if it is to be spun into fine yarn it is further combed on still finer heckles. The object of the process is to separate the flax into two portions, viz. 'line,' which is the long and best portion, and 'tow,' which is the short and ravelled portion. What are called vertical sheet-heckling machines are now extensively employed. This kind of machine consists of endless leather sheets moving over rollers placed at some distance apart with proper driving-gear. A number of

heckle-stocks, placed at regular intervals, are fixed on the surface of these sheets or bands, two of which are placed opposite to, and so near each other that their respective heckle-pins intersect where the actual heckling takes place. At this part of their course the sheets move in a nearly vertical direction downwards, and heckle the flax, which is fixed in a holder and hangs down between the sheets. There are other kinds of heckling-machines.

Preparing.—After the heckling, the flax 'line' is carefully sorted into qualities, and then undergoes a treatment on certain machines called 'preparing.' These are of the same nature as the machines used in the corresponding stages of the spinning of jute, under which head they are briefly noticed; but they will be more fully described under SPINNING. They are (1) the *spreading-frame*, where the flax is first formed into a continuous ribbon or sliver. (2) The *drawing-frames*, on each of which this sliver is 'doubled' and drawn out by rollers through travelling gills with steel teeth, a similar arrangement forming part of the spreading-frame. There are generally three, and occasionally four, drawing-frames, each successive frame having finer gill teeth than the one before it, and from eight to fifteen slivers delivered by one of these machines are drawn out into one sliver by the next. The object of so much doubling and drawing is to produce a sliver of very uniform size throughout, and with the fibres all parallel. (3) The *roving-frame* through which the sliver is passed singly: it is so far similar to the drawing-frame in construction, but with a flyer and bobbin for the now greatly attenuated sliver, which is slightly twisted by the former and wound upon the latter. Flax-tow is carded in the same way as Jute (q.v.), and then goes through the preparing processes just described.

Spinning.—The 'rove' or 'rovings' are spun into yarn on the 'throstle' invented by Arkwright. This machine is also used in spinning cotton, and it does not differ in principle for either fibre (see SPINNING). A peculiarity in flax-spinning is that for all fine yarns the fibre is spun wet—the temperature of the water used being 120° F. By this treatment a given weight of flax can be spun into a much greater length than formerly, and a better yarn is produced. Dry spinning is, however, adopted for coarse and heavy yarns.

Weaving.—The hand-loom is still applied, to some extent, to the weaving of fine linens, but for linen fabrics generally the power loom is in almost universal use. It was found to be a much more difficult task to adapt the power-loom to linen than to cotton owing to the want of elasticity in flax-yarn. The construction of looms is explained under WEAVING, and the bleaching and calendering of linen and other fabrics are described under these several heads.

Linen is manufactured in most European countries, but on the Continent the industry attains much importance only in France, Belgium, and Germany. The neighbourhood of Courtrai in Belgium, and Westphalia in Germany, have long had a reputation for producing yarns of extreme fineness for costly lace. France is celebrated for her cambrics and beautiful damasks. In the United Kingdom the finest linens are made at Belfast and other places in Ulster, the classes of goods made being lawn and cambric handkerchiefs, supple linens, printed linens for dresses, damask table-linen, shirtings, sheetings, and towellings. At Dumfries and several other places in Fife, Scotland, linen damasks, diaper towelling, and plainer fabrics of medium weight are largely manufactured, upholstery linen being chiefly made at Kirkcaldy. Linen goods of similar character are

extensively woven at Bunsley, in Yorkshire. Heavy fabrics, such as sailcloth, canvas, and sacking, are made at Dundee, Arbroath, and a few more Forfarshire towns.

Of our great textile manufactures the making of linen fabrics is the only one that shows signs of becoming a contracting industry. For several kinds of heavy goods it has to compete with jute, and for certain medium and fine fabrics with cotton. Compared with these, linen is a costly textile, and its advantages of strength, glossiness, and, in the fine qualities, of not being easily soiled seem insufficient to keep up the former demand for it for some purposes. The great fault of flax is that the steeping process does not remove all the natural gum in the fibre. It has been stated by experts of high standing that, if the gum could be completely taken out by some inexpensive process, there is no reason why flax should not be spun as easily as cotton. For some fabrics, such as sheetings, which not many years ago were most largely made of linen, cotton, owing to its greater warmth and cheapness, is now preferred; and for others, such as damasks, the two materials are of late years often used together.

The total annual value of the linen manufactures exported from the United Kingdom has for some years past averaged between five and six million pounds sterling.

The manufacture of linen in the United States has never been extensive, the limited quantity of flax grown there being raised more for the seed than the fibre.

Line Spectrum. See SPECTRUM.

Lines of Force. See MAGNETISM.

Ling (*Molva vulgaris*), a fish of the family Gadidae, abundant on most parts of the British coasts, and elsewhere throughout the northern seas, and in value almost rivalling the cod. In form it is much more elongated than the cod, and even more than the hake, with which it agrees in having two dorsal fins and one anal fin, the anal and second dorsal long; but it differs from the hake in having a barbel below the chin, and teeth of unequal size on the jaws and vomer. The ling is generally three or four feet long, sometimes more, and has been known to weigh seventy pounds. The colour is gray, inclining to olive, the belly silvery, the fins edged with white. The tail-fin is rounded. The gape is large, and the mouth well furnished with teeth. The ling is a very voracious fish, feeding chiefly on smaller fishes. It is also very prolific, and deposits its spawn in June; the ova, as usual in the Gadidae, are pelagic. It is found chiefly where the bottom of the sea is rocky. Great numbers are caught in the same manner as cod, by hand-lines and long lines, on the coasts of England, Scotland, the Orkney and Shetland Islands, &c.; considerable numbers are also taken by the trawl. Most of them are split from head to tail, cleaned, salted in brine, washed, dried in the sun, and sent to the market in the form of *Stock-fish*. They are largely exported to Spain and other countries. The air bladders or *souffles* are pickled like those of cod. The liver also yields an oil similar to cod liver oil, which is used for the supply of lamps in Shetland and elsewhere. Two other species of *Molva* from the coasts of Europe have been described.

Ling. PLUR. HENRIK. See GYMNASIUM.

Linga (a Sanskrit word which literally means a sign or symbol) denotes, in the sectarian worship of the Hindus, the Phallus (q.v.), as emblem of the male or generative power of nature. The Linga worship prevails with the Sivaites (see INDIA, p. 106). Originally of an ideal and mystical nature, it has degenerated into practices

of the grossest description; thus taking the same course as the similar worship of the Chaldeans, Greeks, and other nations of the east and west. The manner in which the Linga is represented is generally indolentive—a pillar of stone or other cylindrical objects being held as appropriate symbols of the generative power of Siva. Its counterpart is *Yoni*, or the symbol of female nature as productive. See Muir's *Sanskrit Texts* (vol. iv.), and Kittel's monograph (Basel, 1876).

Lingard, JOHN, historian, was born at Winchester, 5th February 1771. Both his parents were Lincolnshire Catholics, his father a carpenter, his mother the daughter of a respectable farmer who had been ruined by the penal laws. A promising boy, he was sent in 1782 by Bishop Talbot to the English College of Douay (q.v.), where he remained till in 1793 it was broken up by the Revolution. The Catholic Relief Act enabling Catholics to open schools in England, the Douay community was transferred first to Crook Hall, near Durham, and in 1808 to Ushaw. Lingard, who had accepted the office of tutor in Lord Stourton's family, in 1794 resumed his theological studies, and, next year receiving priest's orders, became vice-president of the college, prefect of the studies, and professor of Philosophy. In 1811 he accepted the secluded mission of Hornby, near Lancaster, declining the offer of the presidency of Maynooth, as fourteen years later of a cardinal's hat; and here he 'grew old in illustrious obscurity.' He twice visited Rome, in 1817 and 1825; in 1821 obtained his doctorate from Pius VII.; and in 1830 received a crown pension of £300. He died at Hornby, 17th July 1851, and was buried in the cloister at Ushaw. His first important work, the *Antiquity of the Anglo-Saxon Church* (2 vols. 1806; 5d and much enlarged ed. 1845), was but the pioneer of what eventually became the labour of his life—a *History of England to 1688* (8 vols. 1819-30; 6th ed. 10 vols. 1854-55). This from the outset attracted much attention; and the first two editions brought its author £4133. It was fiercely assailed in the *Edinburgh Review*; but Dr Lingard in his reply displayed so much erudition, and so careful a regard for original authorities, that the result was to add materially to his reputation as a scholar and a critic. The chief mark of its Catholic origin is not seldom the absence of Protestant bias and prejudice; still, it is as declaring the views of a candid and judicious Catholic that the later volumes retain a permanent value. The earlier volumes have been largely superseded. For Lingard's minor writings, which were numerous, see the Memoir by Canon Tierney, prefixed to vol. x. of the 6th ed. of the *History*.

Lingua-Franca, the corrupt Italian which has been employed, since the period of the Genoese and Venetian supremacy, as the language of commercial intercourse in the Mediterranean, especially the Levant. Any language which serves a similar purpose, as, for instance, Swahili and Hausa in Africa, and the Chinook jargon in the north-west of the United States, is called generally a *Lingua-franca*. Compare 'pigeon English,' under CHINA.

Lingula, a genus of Brachiopoda (q.v.).

Lingula Flags. See CAMBRIAN SYSTEM.

Liniments (from the Latin word *linire*, 'to besmear') may be regarded, in so far as their physical properties are concerned, as ointments having the consistence of oil, while, chemically, most of them are *soaps*: that is to say, compounds of oils and alkalies. In consequence of their slighter consistence, they are rubbed into the skin more readily than ointments. Among the most important of them are: *Liniment of Ammonia*, popularly known

as *Hartshorn and Oil*, which is prepared by mixing and shaking together solution of ammonia and olive-oil, and is employed as an external stimulant and rubefacient to relieve neuralgic and rheumatic pains, sore throat, &c.; *Soap Liniment*, or *Opodeldoc*, the constituents of which are soap, camphor, and spirits of rosemary, and which is used in sprains, bruises, rheumatism, &c.; *Liniment of Lime*, or *Carron Oil*, which is prepared by mixing and shaking together equal measures of olive or linseed oil and lime water; it is an excellent application to burns and scalds, and from its general employment for this purpose at the Carron iron-works has derived its popular name: *Camphor Liniment*, consisting of camphor dissolved in olive-oil, which is used in sprains, bruises, and glandular enlargements, and which must not be confounded with *Compound Camphor Liniment*, which contains a considerable quantity of ammonia, and is a powerful stimulant and rubefacient; and the *Opium Liniment*, which consists of soap liniment and tincture of opium, and is much employed as an anodyne in neuralgia, rheumatism, &c. These are the chief liniments according to the old definition, but the term has gradually come to be applied to tinctures intended for external use. Such are the liniments of aconite, belladonna, cantharides, iodine, &c., which are made by treating the drugs with alcohol, and thus obtaining a concentrated tincture.

Linköping, one of the oldest towns in Sweden, capital of East Gothland and the seat of its bishop, stands $3\frac{1}{2}$ miles S. of Lake Roxen and 142 miles by rail SW. of Stockholm. The Romanesque cathedral, which dates from the 12th century, is one of the finest churches in Sweden. Since 1887 Linköping has had direct communication for vessels with the Baltic, and now exports timber and gilded mouldings. Pop. (1875) 8112; (1890) 12,649.

Links. See GOLF.

Linley, THOMAS, English musical composer, was born at Wells in 1732. He first gained a reputation at Bath as teacher of singing and conductor of the concerts in the Assembly Rooms. But in 1775 his son-in-law Sheridan induced him to compose great part of the music for his opera *The Duenna*, and persuaded him to go to London to superintend its performance. In the following year the two, in conjunction with R. Ford, bought Garrick's share of Drury Lane Theatre. During the next fifteen years Linley was musical director of this theatre, composing numerous occasional pieces and the music of the operas *Gentle Shepherd* (1781), *Carnival of Venice* (1781), *Selima and Azor* (1784), *Strangers at Home* (1786), *Love in the East* (1788), &c. Linley's name stands highest, however, as a composer of music for songs and elegies—it is simple, sweet, melodious, and yet lively. He died in London on 19th November 1795. —Two of his sons inherited his musical talent, THOMAS (1756-78), who possessed real genius and was a friend of Mozart in Italy, and WILLIAM (1767-1835), who composed a number of glees, songs, &c.

Linlithgow, an ancient royal burgh, the county town of Linlithgowshire, lies 16 miles W. of Edinburgh, near the southern shore of Linlithgow Loch, which, 150 feet above sea-level, covers 102 acres, and deepens westward from 10 to 50 feet. On a promontory, 66 feet high, stands the stately ruin of Linlithgow Palace, mostly rebuilt between 1425 and 1628, and fired by Hawley's dragoons in 1746. It was the birthplace of James V. and Mary Stuart. The neighbouring parish church of St Michael's is a very good Decorated structure of mainly the 15th and 16th centuries; within its south transept James IV. received the Flodden

warning. Another event in Linlithgow's history was the murder of the Regent Moray. The Cross Well (rebuilt in 1807) and the new town-hall (1889) are also noteworthy. With Falkirk, &c., Linlithgow returns a member. Pop. (1881) 3187; (1891) 4155. See Wadlie's *History of Linlithgow* (3d ed. 1879).

Linlithgowshire, or WEST LOTHIAN, a Scottish county, washed on the north for 17 miles by the Firth of Forth, and elsewhere bounded by Edinburgh, Lanark, and Stirling shires. Its length south-westward is 22 miles, its average breadth 7 miles, and its area 127 sq. m. The only large streams are the Almond on the south-eastern, and the Avon on the western boundary; and the principal eminences are Cairnmaple (1016 feet), Cocklerue (912), Deilmont Law (686), and Glower-o'er-em (559), the last with a monument to General Adrian Hope, who fell in the Indian Mutiny. The rocks are carboniferous, with igneous intrusions; and coal has been largely mined since the 12th century, as also are ironstone, fireclay, and shale. Excellent sandstone is quarried at Binny. The soil is generally fertile, except to the south and south-west, where it is moorish or rocky; and as much as 73 per cent. of the whole area is in cultivation, whilst woods cover 4982 acres. Towns, noticed separately, are Linlithgow, South Queensferry, Bathgate, Boness, and Broxburn; among the mansions are Hopetoun, Dalmeny, Dundas, and Kinneil; and the antiquities include prehistoric and Roman remains, the Romanesque church of Dalmeny, the castles of Barnbougle, Blackness, Niddry, &c., and the preceptory at Torphichen of the Knights of St. John. The county returns one member to parliament. Pop. (1801) 17,844; (1841) 26,872; (1891) 52,808. See Sibbald's *History of Linlithgowshire* (1710), and Small's *Castles and Mansions of the Lothians* (1883).

Linnaea. See CAPRIFOLIACEÆ.

Linnaeus, CARL, ennobled in 1757 as CARL VON LINNÉ, the founder of modern botany, was born at Råshult, in the Swedish province of Småland, on 23d May 1707. His father, the rector of the parish, destined him for his own profession, the church. But whilst still a child Carl showed a passion for flowers. He was sent to school at Wexjö, then passed on to Lund (1727) and Upsala universities to study medicine; but his real study was botany. In 1730 he was appointed assistant to the professor of botany in Upsala. The greater part of 1732 was occupied in executing a commission from the Upsala Academy of Sciences—an exploring trip through Swedish Lapland, the botanical results of which were published as *Flora Laponica* in 1737. His diary of this journey was translated into English and published by Sir J. E. Smith in 1811 as *Luchesis Laponica*. Then followed a journey of scientific exploration and survey through the province of Dalecarlia. In 1735 he went abroad to take his doctor's degree at Harderwijk in Holland. Passing on to Leyden and Amsterdam, he found encouragement in Gronovius, to whom he showed the MS. of the *Systema Naturæ*, and helpful patronage in Boerhaave, who introduced him to the wealthy Dutch banker, Clifford. Clifford, who had a magnificent garden and greenhouses and botanical collections, employed the young Swede to arrange them for him. It was the autumn of 1737 before he was done with the work. But in the meantime he had paid a visit to England, and published some of his most famous books, such as the *Systema Naturæ*, *Fundamenta Botanica*, *Genera Plantarum*, *Critica Botanica*, in which he expounded his celebrated system of classification, based on differences in sexual characteristics. This system of Linnaeus, although intentionally an artificial

one, was predominant for a long time in the botanical schools of Europe (see BOTANY). On his way home he was tempted to stay nearly a year at Leyden to help to arrange the botanical garden belonging to the university. Then he paid a flying visit to Paris, where he became acquainted with Bernard and Joseph de Jussieu. On reaching home he practised as a physician in Stockholm for three years with brilliant success. In 1741 he was appointed professor of Physics and Anatomy at Upsala, but exchanged this chair for that of Botany in the following year. With this post was combined the directorship of the botanical gardens. During the many years that Linnaeus taught botany his fame and his lectures increased the number of pupils attending the university from five to fifteen hundred. The years 1745-46 were marked by the publication of the *Flora Suecica* and *Fauna Suecica*, the latter embodying the results of fifteen years' labour; 1751 by the *Philosophia Botanica*; and 1753 by the appearance of *Species Plantarum*, in which he first fully established the custom of using a second or trivial name in addition to the generic name, by which to identify a plant. Just previous to his appointment as professor he conducted a scientific journey through the islands of Öland and Gotland, in 1746 a similar journey through the province of West Gothland, and in 1749 another in the province of Skåne, of all of which he wrote descriptive accounts in Swedish. Linnaeus died on 10th January 1778. See *Through the Fields with Linnaeus*, by Mrs Florence Caddy (2 vols. 1887), which supersedes the *Life* (Eng. trans. 1794) by Stoeber.

The LINNEAN SOCIETY was formed in London in 1788, and obtained a royal charter in 1802. Its founder and first president was Sir J. E. Smith, who purchased the books and MSS. and botanical collections of Linnaeus after the death in 1783 of the great botanist's son, and from whom they passed into the hands of the society in 1828.

Linnell, JOHN, artist, was born in London in 1792, in 1805 entered as a student at the Royal Academy, and distinguished himself greatly during his course, not only in painting, but in sculpture and engraving. He was a pupil of Benjamin West and Varley, and himself taught drawing to Mary Wollstonecraft Shelley. He painted many portraits of eminent men, as his friend Blake, Malthus, Whately, Peel, and Carlyle. His landscapes were mostly painted from the sweet scenery of Surrey. Of these need only be named 'Harvest Showers,' 'A coming Storm,' 'Autumn,' and 'The Heath.' Linnell died at Redhill, January 20, 1882. See his *Life* by A. T. Story (1892).

Linnet (*Acanthis*), a genus of Passerine birds in

Linnet (*Acanthis cannabina*).

the finch family Fringillidae, familiarly represented by the Grey, Red, or Rose Linnet (*Acanthis*

cannabina). This bird is common in Britain, and widely distributed in Europe and in north-west Africa. It is rather under 6 inches in length, and exhibits, as its common names suggest, a marked seasonal change of plumage. It feeds on soft seeds, and breeds in spring. The nest, made of soft stems and moss, lined with wool and down, is especially common in furze and other low bushes. The eggs (4 to 6) have a bluish-white ground, speckled with reddish brown or purplish red; two broods may be reared in the season. The linnet or 'lutic' sings well, is amenable to education, and is but too often caged. In the mountain-regions of Scotland it is represented by the *Turd* or Mountain-linnet (*A. flavirostris*), while other British species are the Mealy Redpole (*A. linaria*) and the Lesser Redpole (*A. rufescens*), the smallest of British finches. The Green Linnet is the Greenfinch (*Ligurianus chloris*).

Linoleum. See FLOORCLOTH.

Linseed, the seed of flax, largely imported from the Continent and India, for making *linseed-oil* and *oil-cake*. In making these the seeds are first bruised or crushed, then ground, and afterwards subjected to pressure in a hydraulic or screw press, sometimes without heat, and sometimes with the aid of a steam heat of about 200° (93·4 C.). *Linseed-oil* is usually amber-coloured, but when perfectly pure it is colourless. It has a peculiar and rather disagreeable odour and taste. It is chiefly used for making varnishes, paints, &c. That made without heat (*cold-drawn linseed-oil*) is purer, and less apt to become rancid, than that in making which heat is applied. By cold expression the seed yields from 18 to 20 per cent., and with heat from 22 to 27 per cent. of oil. *Linseed-oil* boiled, either alone or with litharge, white lead, or sulphate of zinc, dries much more rapidly on exposure to the air than the unboiled oil; and *boiled* or *drying oil* is particularly adapted for many uses.—The Oil-cake (q.v.) made in expressing linseed-oil is very useful for feeding cattle. *Linseed* itself is excellent food for cattle and for poultry. The seed coats abound in mucilage, which forms a thick jelly with hot water, and is very useful for fattening cattle.—*Linseed-meal*, much used for poultices, is generally made by grinding fresh oil-cake, but it is better if made by grinding the seed itself.

Lint was the name given to linen cloth or rags when shredded or scraped down so as to form a soft material, suitable for dressing wounds and soaking up discharges. This is now superseded by a cotton cloth specially woven for the purpose, with one side soft and fluffy. See also FLAX.

Linton, SIR JAMES DRUMGOLE, water-colour and oil painter, was born in London, 26th December 1810. He laboured with success to elevate the status of his favourite branch of art, painting in water-colours; and in 1883 the Institute of Water-colour Painters, of which he had been elected a member in 1867, was reorganised, its title being henceforth the Royal Institute of Painters in Water-colours, and its exhibitions being thrown open to everybody, not confined, as hitherto, to members. Linton himself was chosen president in 1881, and in the following year was knighted. His most successful pictures are those of single figures. As a painter in oil his most notable productions are the 'Marriage of the Duke of Albany,' painted by royal command in 1885, and a series illustrative of the 16th century for a private house at Nottingham.

Linton, WILLIAM JAMES, wood-engraver and author, was born in London in 1812. As a wood-engraver he may be said to be the most artistic who ever lived. Some of his finest work may be

found in the pages of the *Illustrated London News*, to which he frequently contributed, from its commencement till he finally went to the United States in 1867. As an author, the zealous chartism of his youth tinged much of his work. Among his various works may be mentioned *The Plain of Freedom* (1852), *Charibel and other Poems* (1865), several volumes of *The English Republic*, *Some Practical Hints on Wood-engraving* (1879), *Life of Thomas Paine* (1879), *A Manual of Wood-engraving* (1884), *Poems and Translations* (1889), and *The Masters of Wood-engraving* (1890). He died 29th Dec. 1897. See his *Memoirs* (1895).—His wife, ELIZA LYNN, born at Keswick, 10th Feb. 1822, had published her first novel a dozen years before their marriage in 1858. Together they prepared a volume on *The Lake Country* (1861), he furnishing the illustrations and she the letterpress; in 1867 they separated. Mrs Lynn Linton was an indefatigable worker, and her novels were many: *The True History of Joshua Davidson* (1872) and *The Autobiography of Christopher Kirkland* (1885) are of heavier calibre than the rest. She did a great deal of magazine work, and her 'Girl of the Period' articles in the *Saturday Review* appeared in a collected form in 1883. She died in London 14th July 1898.

Linz, capital of the crown-land of Upper Austria, is situated on the right bank of the Danube, which is here crossed by an iron bridge 780 feet long, 117 miles by rail W. of Vienna. Pop. (1890) 47,685. It has a splendid new Gothic cathedral (1862-90), the old cathedral church (1670), the bishop's palace, the national museum, a library of 33,000 vols., a bishop's seminary, a commercial school, &c. Owing to its situation on the Danube and to its being an important railway centre, Linz is a busy commercial place; its industries include the manufacture of woollen goods, tobacco, linen, leather, machinery, &c. Shipbuilding is likewise carried on. As a place of some strategic importance Linz has been besieged on several occasions, notably by the peasants in 1626, and during the war of the Austrian succession in 1741 and again in 1742. Here peace was signed between the Emperor Ferdinand III. and George Rakoczy of Transylvania in 1645, and in the vicinity Bernadotte defeated the Austrians in 1809. See works by Krackowizer (1875) and Hiptmair (1885).

Lion (*Felis leo*), the largest and most majestic of the Felidae. It is, when mature, of a nearly uniform tawny or yellowish colour, paler on the under parts; the young alone exhibiting spots like those common in the Felidae. The male has usually a great shaggy and flowing mane; and the tail, which is pretty long, terminates in a tuft of hair. The whole frame is extremely muscular, giving, with the large head, bright flashing eye, and copious mane, a noble appearance to the animal, which, with its strength, has led to its being called the 'king of beasts,' and given rise to fancies of its noble and generous disposition, having no foundation in reality. A lion of the largest size measures about 8 feet from the nose to the tail, and the tail about 4 feet. The lioness is smaller, has no mane, and is of a lighter colour on the under parts. The strength of the lion is such that he can carry off a heifer as a cat carries a rat.

The lion is an inhabitant of the tropical and subtropical regions of Africa and Asia. It was anciently much more common in Asia, and was found in some parts of Europe, particularly in Macedonia and Thrace, according to Herodotus and other authors. The Cave Lion (*Felis spelæa*), whose bones are met with in cave-deposits of England and the Continent, hardly differs from *Felis leo*. The lion is not in general an inhabitant of deep forests,

but rather of open plains, in which the shelter of occasional bushes or thickets may be found. The breeding-place is always in some much secluded retreat, in which the young—two, three, or four in a litter—are watched over with great assiduity by

Lion (*Felis leo*)

both parents, and, if necessary, are defended with great courage—although, in other circumstances, the lion is more disposed to retire from man than to assail him or contend with him. When met in an open country the lion retires at first slowly, as if ready for battle, but not desirous of it; then more swiftly; and finally by rapid bounds. If compelled to defend himself he manifests great courage. The lion often springs upon his prey by a sudden bound, accompanied with a roar; and it is said that if he fails in seizing it he does not usually pursue, but retires as if ashamed; it is certain, however, that the lion also often takes his prey by pursuing it, and with great perseverance. The animal singled out for pursuit, as a zebra, may be swifter of foot than the lion, but greater power of endurance enables him to make it his victim. Deer and antelopes are perhaps the most common food of lions. The lion, like the rest of the Felidae, is pretty much a nocturnal animal; its eyes are adapted for the night or twilight rather than for the day. It has a horror of fires and torch-lights; of which travellers in Africa avail themselves, when surrounded by prowling lions in the wilderness by night, and sleep in safety. Lions rapidly disappear before the advance of civilisation. In India they are now confined to a few wild districts; and in South Africa their nearest haunts are far from Capetown and from all the long and fully settled regions.

The mane of the lion, and the tuft at the end of the tail, are not fully developed till he is six or seven years old. The tail terminates in a small prickle, the existence of which was known to the ancients, having been discovered by Diodorus Alexandrinus, one of the earliest commentators on the *Iliad*; it was supposed by them to be a kind of goad to the animal when lashing himself with his tail in rage. The prickle has no connection with the caudal vertebrae, but is merely a little nail or horny cone, about two lines in length, adhering to the skin at the tip of the tail. It has been stated to occur also in the leopard.

There are several varieties of the lion, slightly differing from each other in form and colour, but particularly in the development of the mane. The largest lions of the south of Africa are remarkable for the large size of the head and the great and black mane. The Persian and other Asiatic lions are generally of a lighter colour, and inferior in size, strength, and ferocity to the African lion. Guzerat and the south of Persia produce a some-

what smaller variety, remarkable as being almost destitute of mane.

The lion is easily tamed, at least when taken young, and when abundantly supplied with food is very docile, learning to perform feats which excite the admiration of the crowds that visit menageries. The greatest of lion-tamers, Van Amburgh, died in his bed at Philadelphia, 29th November 1865; still, exhibitions of this kind are not unattended with danger, as too many instances have proved. Lions were made to contribute to the barbarous sports of the ancient Romans; a combat of lions was an attractive spectacle, and vast numbers were imported into Rome, chiefly from Africa, for the supply of the amphitheatre. Pompey exhibited 600 at once. Lions were kept in the Tower of London from the 13th century till 1834; and one died here in 1770 after seventy years' confinement. They have not unfrequently bred in the menageries of Europe (with particularly good results in the Dublin Zoological Gardens), and a hybrid between the lion and the tiger has occasionally been produced. For the lion in herakdry, see ILLUSTRATION.

Leonardo da Vinci. See LEONARDO.

Lions, GULF OF (*Golfe du Lion*), the large gulf of the Mediterranean on the south of France, extends from the frontier with Spain eastwards to the Hyères Islands.

Lipari Islands, known also as the **ÆOLIAN ISLANDS**, a volcanic group in the Mediterranean, consisting of half-a-dozen larger and numerous smaller islands, with an aggregate area of 116 sq. m., and situated off the north coast of Sicily, north-west of Messina. They rise to 3170 feet above the level of the sea; many of the smaller islands form part of the rim of a gigantic crater. The ancient classical poets localised in these islands the abode of the fiery god Vulcan—hence their ancient name, *Vulcani Insulae*. Their collective population is 18,000, of whom nearly 8000 belong to the island of Lipari (area, 32 sq. m.), the most important of the group. The next in size are Vulcano, Stromboli, Salina, Filicudi, Alicudi, and Panaria. The principal products of the islands are grapes, figs, olives, wine (Malmsay), borax, pumice-stone, and sulphur. The warm springs are much resorted to, and the climate is delightful. Lipari, the chief town, is a bishop's see and a seaport, and has 4968 inhabitants. Stromboli (3022 feet) is almost constantly active; Vulcano (1017 feet) is so intermittently; the rest are extinct.

Liparite, an igneous rock, so called from its occurrence in the island of Lipari. It has a wide geographical distribution, and is also known as Rhyolite and Quartz-trachyte. It is a highly acid rock, and has a glassy base, often more or less devitrified. Throughout this base are scattered quartz, sanidine, plagioclase, and biotite; and other minerals may also be present. The more compact varieties often exhibit sphenoidal and fluxion structures, which occasionally impart a kind of laminated or banded aspect to the rock. Other varieties of texture range from compact up to coarse-grained and granitoid.

Lipetzki, a town in the Russian government of Tamboff, on the right bank of the Voronezh, a tributary of the Don, and 300 miles by rail SSE. from Moscow, was founded in 1700 by Peter the Great, but only began to flourish at the commencement of the 19th century, when the admirable qualities of its chalybeate springs became known. It has a large annual influx of visitors during summer. Pop. (1894) 15,860.

Lipogram (Gr. *λίπος*, 'I leave out,' and *γράμμα*, 'a letter') is a species of verse charac-

terised by the exclusion of a certain letter, either vowel or consonant. The earliest known author of lipogrammatic verse was the Greek poet Lasus (born 538 B.C.); and it is recorded of one Tryphiodorus, a Græco-Egyptian writer of the same period, that he composed an *Odyssey* in 24 books, from each of which, in succession, one of the letters of the Greek alphabet was excluded. Fabius Claudius Gordianus Fulgentius, a Christian monk of the 6th century, performed a similar feat in Latin. In modern times the Spaniards have been most addicted to this laborious frivolity. Lope de Vega wrote five novels, from each of which one of the vowels is excluded; and several French poets have also practised the trick. See Henry B. Wheatley's book on *Anagrams* (1862).

Lippe, or, as it is generally called, but incorrectly, LIPPE-DETMOLD, a small principality of northern Germany, lying between Westphalia on the W. and Hanover on the E. The Weser touches it on the N. and the Tentoburger Wood crosses it in the S. Area, 475 sq. m.; pop. (1875) 112,442; (1890) 128,495, of whom only 4332 were Catholics. The present constitution of Lippe dates from 1853; capital, Detmold (q.v.); other towns, Lemgo and Horn. The surface is hilly; woods cover 28 per cent., and are well cared for. The principal occupation is agriculture, with the rearing of cattle and swine. The products of these callings, with timber, salt, meerschaum pipes, tobacco, and starch, are the chief results of the industrial activity exported. Every spring some 12,000 of the inhabitants spread themselves over central Europe, as far as south Russia, to burn bricks, and return home in the autumn. The little country is governed by an administrative college, and a House of (twenty-one) Representatives, elected directly by the people, who are for that purpose divided into three classes. The princes of Lippe belong to one of the oldest sovereign families of Germany, and can be traced back to the 10th century. The first who took the name of count of Lippe was Bernhard in 1129. The family split into three branches in 1613—Lippe, Brake, and Schaumburg. The second of these became extinct in 1799. For the third, see SCHAUMBURG-LIPPE. See historical works (1847-87) by Falkmann.

Lippi, FRA FILIPPO, commonly known as LIPPO LIPPI, a Florentine painter, was born in 1412; but, losing his parents whilst still an infant, he was entrusted to the Carmelite friars of Florence when only eight years of age. In the story of his life as told by Vasari there are several romantic incidents; but most of them are now discredited, except that he abducted Lucrezia Buti, a ward or novice of the convent of St Margaret at Prato, and afterwards married her. Lippo Lippi, who studied principally Masaccio, painted religious subjects, which he conceived and designed from a human standpoint. His greatest work was done on the choir walls of the cathedral of Prato—illustrations of the lives of John the Baptist and St Stephen. He was busy executing a series of incidents from the life of the Virgin in the cathedral apse at Spoleto, when death arrested his hand for ever, about 8th October 1469. Besides these works he painted several Madonnas and altarpieces, amongst these last one for the nursery chapel of S. Ambrogio, Florence, the subject of Browning's poem. Lippo Lippi had a staunch patron in Cosimo de' Medici. See Crowe in *Nineteenth Century*, 1896.

His son, FILIPPINO LIPPI, was born at Florence in 1460, and educated at Prato. His artistic style has a strong element of originality, but also shows the influence of his father and Botticelli. His most celebrated frescoes are scenes from the lives of St Peter and St Paul in the Brancacci chapel at

Florence (cf. MASACCIO), incidents illustrating the character of St Thomas Aquinas in the Minerva church at Rome, and subjects from the legends of St John and St Philip in Sta Maria Novella at Florence. His best easel-pictures include 'The Virgin and Saints' (in the Uffizi at Florence), 'The Adoration of the Magi,' 'The Vision of St Francis.' Filippino died in April 1504 at Florence.

Lippincott, JOSHUA BALLINGER, an American publisher, was born of Quaker parents in Burlington, New Jersey, in 1816, had charge of a bookseller's business in Philadelphia from 1834 to 1836, when he founded the house of J. B. Lippincott & Co., and by 1850 was at the head of the book-trade in Philadelphia. He died January 5, 1886, and the firm was converted into the J. B. Lippincott Company, the authorised American publishers of the present edition of this work. *Lippincott's Magazine* was established in 1868.

Lippstadt, a town of Prussia, on the river Lippe, 30 miles E. by N. from Dortmund. It has manufactures of spirits, beer, cigars, brushes, ropes, iron, &c. Founded in 1168, it was captured by the Spaniards in 1620, and by the French in 1757. Pop. 11,504.

Lipsius, RICHARD ADELBERT, a great German theologian, was born at Gera, February 14, 1830, studied theology at Leipzig, and, after serving there as *privat-docent* and professor extra-ordinary, was called to fill a chair at Vienna in 1861, at Kiel in 1865, and at Jena in 1871. He died 19th August 1892. Lipsius made contributions of the greatest importance to theological science in the fields of dogmatics and the history of dogma, the philosophy of religion, and New Testament exegesis and criticism. In 1875 he founded the *Jahrbücher für Protest. Theologie*. Among his books are *Glaube und Lehre* (1871), *Die Quellen der Rom. Petrusfrage* (1872), *Lehrbuch der Evangelisch-Protest. Dogmatik* (1876), *Die apokryphen Apostelgeschichten und Apostellegenden* (1883-87), and *Philosophie und Religion* (1885).—Of his brothers, JUSTUS HERMANN (born at Leipzig, 9th May 1834) is eminent as a philologist. After teaching at Leipzig, Meissen, Grimma, he became in 1869 extra-ordinary professor of Classical Philology at the university of Leipzig, and in 1877 ordinary professor of the same, and director of the Russian philological seminary. His books are an edition of the *In Corona* of Demosthenes (1876), and of Meier and Schömann's work, *Der Attische Prozess* (1883-85). He also collaborated with Curtius, Lange, and Ribbeck in the well-known *Leipziger Studien*, established in 1878. Their sister MARIE (born at Leipzig, 30th December 1837) has made valuable contributions to music and its history, under the pseudonym of La Mara, the most important being *Musikl. Studienkopfe* (5 vols. 1868-82), *Gedanken bewahrter Musiker über ihre Kunst* (1873), and a German translation of F. Liszt's *Chopin* (1880).

Liqueur. This name is given to the very numerous alcoholic preparations which are flavoured or perfumed and sweetened to be more agreeable to the taste. *Anisced Cordial* is prepared by flavouring weak spirit with aniseed, coriander, and sweet fennel seed, and sweetening with finely-clarified syrup of refined sugar. *Chore Cordial* is flavoured with cloves, bruised, and coloured with burnt sugar. *Kummel* (a Russian and German liqueur, named from the German name of the herb cummin) is made with sweetened spirit, flavoured with cummin and caraway seeds, the latter usually so strong as to conceal any other flavour. It is chiefly made at Riga. *Maraschino* is distilled from cherries bruised, but, instead of the wild kind, a fine delicately-flavoured variety called *Marasques* are used in Dalmatia. *Noyau*, or *Crème de Noyau*, is a sweet

cordial flavoured with bruised bitter-almonds. *Pep-permint* is usually sweetened gin, flavoured with essential oil of peppermint. *Chartrons*, *Cacagna*, and *Kirschwasser* have separate articles. *Benedictine* is made at Fécamp. *Absinthe* (q.v.) is not a liqueur; *Vermouth* is alcoholised white wine, aromatised with wormwood, gentian, angelica, germander, and oranges. Cherry Brandy and Sloe Gin are sweetened spirits flavoured with cherries and sloes.

Liquidambar, a genus—the only genus—of the order Altingiaceæ. They are tall trees, remarkable for their fragrant balsamic products. *L. styraciflua*, the American Liquidambar, or Sweet Gum tree, is a beautiful tree with palmate leaves, a native of Mexico and the United States. It grows well in the milder parts of Britain. Its wood is of a hard texture and fine grain, and makes good furniture. From cracks or incisions in the bark a transparent, yellowish balsamic fluid exudes, called *Liquid Liquidambar*, *Oil of Liquidambar*, *American Storax*, *Copalin Balsam*, and sometimes, but erroneously, *White Balsam of Peru*. It gradually becomes concrete and darker coloured. Its properties are similar to those of storax. That of commerce is mostly brought from Mexico and New Orleans.—*L. orientalis*, a smaller tree with palmate leaves, is a native of the Levant and of more eastern regions, and yields abundantly a balsamic fluid, which has been supposed to be the *Liquid Storax* imported from the Levant; but on this point there is a diversity of opinion.

Liquidation, the winding-up of any business, but applied more particularly to joint-stock companies. The liquidation of insolvent firms is treated under BANKRUPTCY; that of registered companies is regulated by the Companies Acts, which provide three modes of liquidation: (1) by the court, (2) voluntary, and (3) subject to the court's supervision. Compulsory liquidation may be ordered on petition by a creditor or contributory; voluntary liquidation may be resolved upon by an extraordinary or a special resolution of the shareholders; and a supervision order may on petition and cause shown be pronounced in a voluntary liquidation.

In any case the liquidation is conducted by a *liquidator*, who in court liquidations is appointed by the court and called 'official liquidator,' but in voluntary liquidation is chosen by the shareholders. The liquidator's duty is to wind up as speedily as possible, but he may carry on the business temporarily should that appear necessary for a favourable realisation. He must also prepare a list of contributories, if the capital is not fully paid up or the company is unlimited. This list, which is made up from the register of shareholders, consists of members in their own right and those liable as representatives of others. In addition to these, there is a list (B) of those who have been members within a year of the winding-up and who are liable, if the existing members are unable to satisfy the necessary contribution. They can only, however, be called upon to contribute in respect of unpaid debts incurred before they ceased to be members. A contributory cannot set off a debt due to him by the company against calls by the liquidator so long as any creditors remain unpaid. The claims are ranked and adjudicated upon very much as in bankruptcy, and the surplus, if any, is divided among the shareholders. Unregistered companies, except railway companies incorporated by act of parliament, may be wound up under the provisions of the Companies Acts.

Liquids. See articles on Boiling, Capillarity, Cohesion, Diffusion, Evaporation, Heat, Hydrodynamics, Hydrostatics, Matter, Melting point, Osmosis, Solution, Spheroidal Condition, Surface-tension, and Viscosity.

Liquorice (*Glycyrrhiza*), a genus of perennial herbaceous plants of the natural order Leguminosæ, sub-order Papilionaceæ, having long, pinnate, sweet roots, and generally creeping root-stocks; pinnate leaves of many leaflets, and terminating in an odd one; flowers in spikes, racemes, or heads; a 5-cleft, 2-lipped calyx, and a 2-leaved keel. The ancient Greek name, now the botanical name, signifies *sweet root*, and from it, by corruption, liquorice and other modern names are derived. The roots of liquorice depend for their valuable properties on a substance called *Glycyrrhizine*, allied to sugar, yellow, transparent, uncrystallisable, soluble in both water and alcohol, and forming compounds both with acids and with bases.

They are a well-known article of materia medica, and were used by the ancients as in modern times, being emollient, demulcent, very useful in catarrh and irritations of the mucous membrane.—The roots of the Common Liquorice (*G. glabra*) are chiefly in use in Europe.

The plant has stems 3 to 4 feet high, and racemes of whitish violet-coloured flowers. It is a native of the south of Europe and of many parts of Asia, as far as

Liquorice (*Glycyrrhiza glabra*):
a, 1000.

China. It is cultivated in many countries of Europe, chiefly in Spain, and to some extent at Mitcham in Surrey and at Pontefract in Yorkshire. The roots are extensively employed by porters and brewers. They are not imported into Britain in considerable quantity, but the black inspissated extract of them (*Black Sugar* or *Stalk Liquorice*) is largely imported from the south of Europe, in rolls or *stocks*, packed in bay-leaves, or in boxes of about 2 cwt., into which it has been run. Liquorice is sometimes used in the manufacture of sweet tobacco. Liquorice is propagated by slips; and after a plantation has been made almost three years must elapse before the roots can be dugged up for use. The whole roots are then taken up. Liquorice requires a deep, rich, loose soil, well trenched and manured; the roots penetrating to the depth of more than a yard, and straight taproots being most esteemed. The old stems are cleared off at the end of each season, and the root-stocks so cut away as to prevent overgrowth above ground next year. The plant is propagated by cuttings of the root-stocks. The roots of the Prickly Liquorice (*G. echinata*) are used in the same way, chiefly in Italy and Sicily, Russia, and the East. The only American species is *G. lepalota*, which grows in the plains of the Missouri.

Liquor Laws. Restrictive legislation with regard to the sale of intoxicating drink is almost confined to the English-speaking peoples, and has been carried further in some of the British colonies and in portions of the United States than it has gone as yet in the United Kingdom. Sunday closing, for example, which is partial in the mother-country, is very general in the daughter-lands, and the principle of local option with regard to liquor licensing is widely spread in the colonies, while

total prohibition exists in the state of Kansas and in some other American communities.

In those of the United States in which there is not a local majority in favour of prohibitive legislation, the High License system is being gradually adopted, with the effect of destroying disreputable saloons.

The Dominion of Canada has a local option law, under which the localities have power by a bare majority of votes to close without compensation all places for the sale of drink. The act provides for a reversal of the operation upon a change of local opinion, and while the act has been largely put in force it has been subsequently suspended in many districts. In addition to this law, which is known as the Scott Act (1878), and applies to the whole Dominion, there are restrictive laws in several of the provinces. In some, as in Ontario, the maximum number of licenses that can be granted is regulated according to population, and sale of drink is forbidden on Saturday evenings as well as on Sundays. Generally speaking, it may be said that in all the provinces of the Dominion, except Quebec and British Columbia, there is a good deal of restriction, and in the North-west Territories there is total prohibition of the sale of alcoholic drink—a prohibition which, however, was originally imposed by the Dominion government for the purpose of preventing sale of drink to Indians, but which has been continued in spite of the present existence of a very large white majority. Throughout the greater part of Canada two provisions prevail, which exist also in many states of the American Union and in some of the Australasian colonies. The one is that known as the Civil Damages clause, which provides that wherever any person comes to his death by suicide or otherwise during intoxication the seller of the liquor that caused the intoxication is liable to an action for damages. The other is a provision that the relatives of intemperate persons may notify sellers of drink not to sell it to such persons, and that magistrates may put such persons under notice as habitual drunkards, to whom also drink cannot be sold. This last law, with regard to putting persons under special prohibition, is being gradually adopted in all new liquor acts passed by British colonies and by American states, but there are considerable variations in the mode of application. In some cases the law is so severe that both the publican and the habitual drunkard are subject to punishment if the drunkard is found in the neighbourhood of the licensed house. In certain colonies and provinces, in addition to relatives and magistrates, ministers of religion may put the law in force; and there is a general tendency to strengthen clauses sharply restricting the liberty allowed in the United Kingdom for the consumption of drink by persons who are given to the immoderate use of liquor, and who, owing to such use, waste their property, endanger their health, and diminish the comfort of those about them.

Turning to the Australasian colonies, Victoria possesses, along among English-speaking countries, the principle of local option accompanied by compensation. New Zealand and Queensland possessed in 1890, when South Australia and Tasmania were entering upon, legislation more similar to that of Canada. The New Zealand act creates elective licensing committees, but no new licenses can be granted until the ratepayers have determined on a poll, by a bare majority, that the number of licenses may be increased. In Queensland two thirds of the ratepayers in any locality have power to close all houses, and a bare majority power to reduce the number of licenses or to put a stop to the issue of fresh licenses. In New South Wales there exists a mild form of local option as to new licenses or the increase of licenses, which, however, can scarcely

be said to exceed an expression of local opinion for consideration by the licensing magistrates.

The South African colonies have stringent legislation, not very well enforced in practice, against the sale of drink to the aborigines, but interfere less than does the Dominion of Canada or than do the Australasian colonies with the drinking habits of the white population.

In the crown colonies there is an extraordinary variety of legislation upon the licensing of houses for the sale of intoxicating liquors. In many there is Sunday closing, some imitate the self-governing colonies in forbidding the sale of drink to minors, but few of them possess any form of local option, although that system exists in some, as, for example, the Bahamas.

Throughout Canada and Australia, as in the United States, there is a large party in favour of total prohibition; and the example of the state of Kansas is pointed to as showing the advantages of the system. On the other hand, in Canada, Australia, and some of the United States there is much evasion of the present laws; and this evasion has been in the Dominion one of the chief causes which have led to the abandonment of the prohibitive provisions of the Scott Act in districts where it had previously been put in force. Generally speaking, however, it must be noted that the tendency of legislation and of opinion in the English speaking countries is towards an extension of the principles either of local option or of prohibition.

Much attention has been called in parliament to the liquor question in India and Ceylon, and it has been asserted (and the House of Commons, to judge by a vote in which the government was defeated in 1889, seems to have credited the assertion) that the Indian government has tried to stimulate the sale of drink among natives with a view to the improvement of the revenue; while a similar attack has been made upon the colonial government of Ceylon. The Indian government stoutly denies the charge, and maintains not only that it has had no such intention, but that the measures which have been taken of recent years are rather calculated to decrease than to stimulate the sale of drink. On the other hand, there can be little doubt that the sale of drink in India has increased, the government maintaining, however, that this has been only a consequence of a change in the habits of the people and of the increase in the rate of wages. All organs of native opinion appear, nevertheless, to support the view taken by the majority of the House of Commons. Some official writers, and others friendly to the government of India, have argued that there has in fact been no increase in the consumption in India of intoxicating liquors, and that the increase shown by statistics is only the result of the suppression of illicit distillation. It is, however, obvious that, in face of the strong opinion which exists upon the subject in India and in the House of Commons, government will have to take steps to check that consumption of strong drink which is obnoxious to the religious views of most of the Indian people. See LICENSING LAWS, GOTTENBURG, TEMPERANCE.

Lira (Lat. *libra*). See FRANC.

Liria, a town of Spain, stands on a fertile plain 14 miles NW. of Valencia. Pop. 9445.

Liriodendron. See TULIP-TREE.

Lisbon (Port. *Lisboa*), capital of Portugal, stands on the northern shore of the Tagus (*Tago*), at the shoulder of its bottle-shaped bay—an expansion of the river and 9 miles from the river's mouth; it is 412 miles by rail WSW. of Madrid. The city extends for some 7 miles along the shore, and climbs up the slopes of a low range of hills, occupying a site which for imposing beauty is

surpassed by only two other cities in Europe—Constantinople and Naples. The oldest part of Lisbon is that which escaped the earthquake of 1755; it lies on the east, round the citadel, and consists of narrow, intricate streets, not over clean. It is still known by its Moorish name of Alfama. The western portions were built after the earthquake, with wide and regular streets, fine squares, and good houses. The summits are mostly crowned with what were formerly large monasteries, now dissolved. The cathedral of the 'patriarch,' built in 1147, restored after 1755, has a Gothic façade and choir; its interior is gloomy. The large church of St Vincent contains the tombs of the royal (Braganza) family. The church of Estrella has a dome of white marble, and is a reduced copy of St Peter's at Rome. In San Roque is a chapel thickly encrusted with mosaics and costly marbles; it was first erected in Rome, and consecrated by the pope saying mass in it, before it was set up in Lisbon. But the finest structure in the city is the monastery and church of Belem, a monument to the great seamen of Portugal; it was begun in 1500 on the spot from which Vasco da Gama embarked (1497) on his momentous voyage. It is constructed for the most part in the Gothic style, with an abundance—a superabundance—of decorative ornament, and has magnificent cloisters. Inside the church are new tombs (1880) to Camoens and Vasco da Gama, and the grave of Catharine, wife of Charles II. of England. The monastery is now used as an orphanage and foundling hospital. Neither of the royal palaces, that of the Necessities, or that of Ajuda at Belem, possesses features of great interest. A line square facing the bay is surrounded with government offices, the handsome custom-house, and the marine arsenal. The arts and sciences are not in a flourishing condition, notwithstanding the existence of an academy of sciences (1779), with a library of 60,000 vols., an academy of arts, a polytechnic school (chiefly for the technical branches of the army), a medical school, a conservatory of music, a public library of 200,000 vols. and 9500 MSS., natural history and other museums, two observatories, &c. There are also a military arsenal, a mint, a large lazaretto, a military and a naval school, &c. A magnificent aqueduct, completed in 1738, brings water to the city from springs 14 miles to the north-west. It withstood the shock of the great earthquake, although it crosses a valley 263 feet above its lowest point, and on thirty-five arches, the longest 110 feet. In the cemetery of the English church Fielding was buried in 1754. The population of the city was 246,343 in 1878; but the municipal boundaries were enlarged in 1885 so as to include Belem and other suburbs, and in 1891 the population was 308,700. The figures quoted include 35,000 Gallegos or natives of Galicia, who serve as water-carriers, porters, &c. A series of forts protect the seaward approaches to the city. The harbour is one of the finest in the world, deep, well sheltered, and large enough to hold all the navies of Europe. Nevertheless, in 1899-1900, the government were spending £2,400,000 in improving the port, which is entered annually by 2500 to 3000 vessels of about 2,000,000 tons burden (of which 50 per cent. is British), importing principally corn, cotton goods, sugar, fish, coal, timber, tobacco, coffee, and petroleum to a value of between £5,000,000 and £6,000,000 a year. The exports, whose annual value may be £4,000,000, embrace wine, cork, fish, cattle, oil, salt, and fruits. Much of the total trade is from and with the Portuguese colonies, such imports as cocoa, coffee, and india rubber coming thence. But the trade of Lisbon is small compared with what it was in Portugal's palmy days. The share

of the Portuguese in this trade is exceeded not only by the share of Great Britain, but by that of France and that of Germany. The most important industries of the city are in gold and silver wares and in jewellery; next come cotton-spinning and weaving, the manufacture of silk, hamp, chemicals, hats, boots, tobacco, soap, cutlery, and stoneware, and iron founding.

Lisbon is a contraction of Olisipo, the name by which the place was known when it was the capital of the Lusitanians; it was also sometimes called Ulyssippo, to connect it with a myth about Ulysses. From the Romans it passed to the Goths, and from them was wrested by the Moors in 716. They called it El-Oshbama, and kept their hold of it down to 1147, when Alphonso I. of Portugal seized it with the help of English, German, and Flemish crusaders. In 1373 the city was captured and in great part burned by the Castilians, who again laid siege to it eleven years later, but without success. It was made the capital of the kingdom by John I. in 1422. In 1580 it was seized by Alva for Philip II. of Spain; and it was from this port that the 'invincible' Armada set sail. When the Duke of Braganza roused his countrymen to shake off the Spanish yoke (1640), he recaptured Lisbon, and once more it was made the capital. But the city was doomed to misfortune; it had been three times taken from the Moors by the Christians previous to 1147, it had suffered from a severe earthquake in 1344, and had been visited by the plague in 1348; but the greatest disaster overtook it on 1st November 1755, when, in less than ten minutes, the greater part of the city was made a heap of ruins, from 30,000 to 40,000 persons were killed, and damage done to the extent of nearly 20 millions sterling—one of the greatest earthquake convulsions on record, the shock being perceptible in one direction as far as Scotland, in another at Mitylene in Asia Minor, and in a third at Fez in Morocco. The French were in possession of the city for ten months during 1807-8. The tale of Lisbon's misfortunes was completed by a series of military revolts during the second quarter of the 19th century, especially in 1831, and by a bad attack of yellow fever in 1859. St Antony of Padua, Camoens, and Pope John XXI, were natives of Lisbon. See Macedo, *Guide to Lisbon* (1875).

Lisburn, a market-town, partly in Antrim, partly in Down, on the Lagan, 93 miles by rail N. by E. of Dublin and 8 SW. of Belfast. The importance of the place is due to the Conway family, who built a castle here in the time of Charles I. and introduced the existing industries. It is a clean and well-ordered town, and manufactures linens, damasks, muslins, &c., and has flax-spinning and bleaching. Its parish church is the cathedral of Down, Connor, and Dromore, and contains a monument to Bishop Jeremy Taylor, who died here in 1667. Till 1885 Lisburn returned one member to parliament. Pop. (1851) 6569; (1881) 10,755; (1891) 12,250.

Lisieux (ancient *Nortiomagus Leuciorum*), a town in the French department of Calvados, 30 miles by rail E. by S. of Caen. In the church of St Pierre (1045-1233; a cathedral down to 1801), Henry II. of England married (1152) Eleanor of Guienne. Lisieux is the centre of an extensive manufacture of coarse linens (*cratons*, from the original maker), woollens, flannels, cottons, &c. Pop. (1872) 12,520; (1891) 16,260. Four miles distant is Val Richer, where stood the abbey of which Thomas Becket was first abbot, and the ruins of which were made into a summer residence for Guizot.

Liskeard, a municipal borough in Cornwall, stands on steep hills overlooking the Looe, 18 miles

WNW. of Plymouth. It has manufactures of leather and iron, and a lively trade with the neighbouring mines. St Martin's church, Perpendicular in style, and restored in 1879, is one of the largest in Cornwall, and has a tower of the 14th century. The town-hall (1859) is a good Italian building. A stannary or coinage town, Liskeard was made a free borough in 1250 by Richard, king of the Romans, who built a castle here. Till 1832 it returned two members (Coke and Gibbon the most illustrious), and then till 1885 one member. Pop. (1851) 4386; (1881) 4536; (1891) 3984. Two miles south is the spring of St Keyne (q.v.). See Allen's *History of Liskeard* (1856).

Lisle, ALICIA, the aged widow of one of Cromwell's lords, was beheaded at Winchester on 2d September 1685 for having sheltered one Nelthrop, a rebel fugitive from Sedgemoor. Thirty-six years before, at Charles I.'s execution, she had said that her blood leaped within her to see the tyrant fall.

Lisle. See ROUGET DE LISLE.

Lismore, a town on the Blackwater, in Ireland, in the two counties of Cork and Waterford, and 43 miles SW. of Waterford city. The cathedral, the parish church since the see was united to Cashel, was rebuilt in 1663, on the site of a monastery founded before 549, and a celebrated school of learning from 635 till its destruction by the Danes in 833. The castle, originally founded by John Lackland in 1185, was the residence of the bishops till the 16th century. In 1587 it was given to Sir W. Raleigh, who sold it to the 'great' Earl of Cork, and in it his son, Robert Boyle (q.v.), was born. It was twice besieged during the Great Rebellion, and on the second occasion (1645) it yielded to the parliamentary forces. In 1753 it passed to the Duke of Devonshire. Lismore returned two members from Charles I.'s reign to the Union. Pop. 1660.

Lismore (Gael. 'great garden'), an island of Lorn, Argyllshire, in Loch Linnhe, 1 furlong from the mainland, and 8 miles N. of Oban. It rises to 417 feet, and is 10½ miles long, 1½ mile broad, and 604 acres in area. Besides a lighthouse (1833), it contains several interesting remains—the choir of the cathedral (1236) of the pre-Reformation diocese of Lismore or Argyll (since 1749 used as the parish church); Achanduin Castle, the residence of the bishops; and Castle-Rachal, a Scandinavian fort. Pop. (1831) 1790; (1891) 561, mostly Gaelic speaking. See also GAELIC LANGUAGE.

Lissa (Pol. *Leszno*), a town of Prussia, 40 miles S. by W. of Posen, was during the 16th and 17th centuries the headquarters of the Bohemian Brethren in Poland; here were their most celebrated school, a seminary, a printing-office, and their archives. The town grew up round a colony of that sect, to whom the Leszczynski family afforded an asylum early in the 16th century. It was burned by the Poles in 1656, and again by the Russians in 1707; but is now a place of (1890) 13,116 inhabitants.

Lissa, an island of Dalmatia, in the Adriatic Sea, 32 miles SW. of Spalato. It has an area of 40 sq. m., is mountainous, grows good wine and olive-oil, and has 7871 inhabitants—4317 at the capital, Lissa. The island was held by Great Britain from 1810 to 1815. Off it the Italian fleet was defeated by the Austrians under Tegetthoff on 20th July 1866. See TACTICS (NAVAL).

Lissajous' Figures. See SOUND.

Lister, JOSEPH, LORD (cre. 1897), P.R.S. (from 1895), knight of the Prussian order *Pour le Mérite* and of other foreign orders, was born at Upton, Essex, 5th April 1827, the son of the microscopist Joseph J. Lister, F.R.S. (1786-1869). He graduated at London University in arts (1847)

and medicine (1852), and became a Fellow of the Royal College of Surgeons, England, in 1852, and of the Royal College of Surgeons, Edinburgh, in 1855. He was successively assistant-surgeon and lecturer on surgery, Edinburgh; regius professor of Surgery, Glasgow; professor of Clinical Surgery, Edinburgh; professor of Clinical Surgery, King's College Hospital, London (1877); and was made surgeon extra-ordinary to the Queen. In addition to important observations on the coagulation of the blood, the early stages of inflammation, and other matters, his great work has been the introduction of what is known as the Antiseptic (q.v.) system of surgery. This system and the theory upon which it is based are now almost universally accepted; and their acceptance has in great measure revolutionised modern surgery, removing some of its most serious dangers, and thus greatly widening its field of usefulness. Lister has been awarded many foreign honours, and received the medal of the Royal Society in 1880, the prize of the Academy of Paris in 1881. He is LL.D. of Edinburgh, Glasgow, and Cambridge, and D.C.L. of Oxford; and has written various papers and lectures. He was made a baronet in 1883.

Liston, JOHN (1776-1846), low comedian, played from 1805 to 1837 at the Haymarket, Drury Lane, and the Olympic. 'Paul Pry' (1825) was his most popular creation. See H. B. Baker, *Our Old Actors* (new ed. 1881).

Liston, ROBERT, a celebrated surgeon, was born at Ecclesmachan manse, near Linlithgow, in 1794. He studied at Edinburgh and London, and settled in Edinburgh in 1818 as lecturer on surgery and anatomy. His surgical skill, and the rapidity with which his operations were performed, soon acquired for him a European reputation; and in 1835 he accepted the invitation of the council of University College, London, to fill the chair of Clinical Surgery. He soon acquired a large London practice; in 1840 he was elected a member of the council of the College of Surgeons; and in 1846 he became one of the Board of Examiners. In the very climax of his fame, he died 7th December 1847. His most important works are *Elements of Surgery* (1831) and *Practical Surgery* (1837). His uncontrollable temper and strong language involved him in various quarrels with his professional brethren, yet he always succeeded in obtaining the regard and esteem of his pupils.

Liszt, FRANZ, pianist and composer, was born at Raiding, in a German-speaking district of Hungary, on October 22, 1811. His father, Adam Liszt, steward of Prince Esterhazy's estates, had himself musical gifts, and guided the precocious talents of his son with great judgment. At the age of nine Franz played in public at Odenburg, and afterwards at Presburg, when several Hungarian noblemen offered the means for his education, and he was taken to Vienna, where he studied under Czerny and Salieri. On December 1, 1822, he appeared at a concert there, and the audience were in raptures with his playing; April 13, 1823, was the date of a memorable concert, after which Beethoven ascended the platform and kissed the boy—a reminiscence to which he always alluded with veneration. He proceeded to Paris, and, though admittance to the Conservatoire was denied by the inflexible Cherubini, he continued his studies under Paer and Reicha. He soon became a favourite in Paris salons, and made a tour to Vienna, Munich, Stuttgart, and Strasburg, with unmistakable success. He visited England thrice in 1824-27, but met with scarcely so much appreciation. In 1827 his father died, and he entered on a great mental struggle. He was repelled by the

then low estate of musical art and artists, and his strong religious feelings drew him towards the church. He was also fascinated by Saint Simonianism, and at intervals the attractions of the world influenced him strongly. In 1831 he heard Paganini, and was fired by the resolve, which he carried to triumphant issue, to become the Paganini of the pianoforte. He became intimate with most of the great *littérateurs* then in Paris, more especially with Lamennais, Lamartine, Victor Hugo, and George Sand, who exercised a marked influence upon him, as did also Chopin. From 1835 to 1845 dates his relationship with the Comtesse d'Agoult (q.v.), known in literature as Daniel Stern, who bore him three children, one of whom, Cosima, became the wife of Von Bülow, and subsequently of Richard Wagner. The enthusiasm which his playing excited in Paris, as elsewhere, has been graphically depicted by Heine. In 1849, at the height of popularity, he retired to Weimar to direct the opera and concerts, and to devote his time largely to composition and teaching. Here he brought out remarkable works denied a hearing elsewhere—e.g. Wagner's *Lohengrin* and Berlioz's *Bevernato Cellini*; and the little town became the centre of musical life in Germany. Here, too, commenced the close relationship with, and incalculable services rendered to, Wagner. In 1861 he resigned his appointment, and his life was subsequently divided mainly between Weimar, Rome, and Budapest, in which latter city he was in 1870 appointed president of the Academy of Music. In 1865 he received minor orders in the Church of Rome, and was afterwards known as Abbé. The record of his visit to London in 1886 is that of a triumphal progress. His influence was irresistible. Passing through Paris, he travelled to Baireuth, where, after attending several of the festival performances, he was attacked by hopeless illness, and breathed his last on July 31, 1886.

All things considered, he may be regarded as at the time the foremost figure in the musical world. As a pianist he was simply unapproachable; he exercised a charm bordering on the fabulous. His supreme command of technique was forgotten by hearers in admiration of the poetic qualities of his playing. That he was equally unique as a teacher is amply evident from the enthusiastic veneration of his pupils, among whom are many of the greatest living masters of the pianoforte. His literary works on music, though rather rhapsodical, are of real value; they include monographs on Chopin and Franz, and a volume on the music of the Gypsies. His influence in bringing to a hearing some of the greatest works of other musicians was invaluable. As a composer there is some difficulty as yet in properly estimating his work. His transcriptions for the piano, at least the later ones, are universally considered the finest ever made; his Hungarian rhapsodies may be deemed the highest reach of this form of composition. His pianoforte works are of enormous number, and not yet completely known. All his original works have a very distinct, sometimes a very strange individuality. He has the merit of creating, in his twelve symphonic poems, a new form of orchestral music. Their most distinctive features are the carrying out of a definite 'programme,' and the Wagnerian use of the *leit-motif*, by which unity is given to the whole piece. One or two masses, the 'Legend of St Elizabeth,' and a few other works, embody his religious aspirations, with reverence for old forms. His songs have a peculiar charm. As a man he possessed a most striking personality, and exercised a powerful fascination on all who came in contact with him. To call his generosity merely is to do honour to the title. The whole proceeds

of every one of his concerts subsequent to 1847, which must have amounted to an enormous sum, were devoted to the benefit of others.

See his *Letters* (trans. 1894); the *Lives* by Miss Bammann (2 vols. Leip. 1880-93, trans. 1882), Nohl (trans. Chicago, 1884), Martin (1886), De Beaufort (1886), and A. Gollerich (Leip. 1888); the *Recollections* (1888) of Miss Janka Wohl; and the *Correspondence, 1841-61, between Wagner and Liszt* (Eng. trans. by F. Huefner, 2 vols. 1888).

Litany (Gr. *litania*, 'supplication'), a form of prayer in which the same thing is repeated several times at no long intervals. Hence in Latin the word is always used in the plural, *litanæ*. The common formula, *Kyrie eleison, Christe eleison, Kyrie eleison*—Lord, have mercy upon us—Christ, have mercy upon us—Lord, have mercy upon us—is the simplest ('lesser') litany. The word may be properly applied to the forms common among the Eastern Christians at different points during the celebration of the eucharist (see LITURGY) and other services, in which the deacon recites a number of short supplications, and the people reply after each '*Kyrie eleison*.' This practice formerly existed in the West at the commencement of the liturgy: it is still preserved in the Ambrosian rite during Lent; and the ninefold *Kyrie* of the Roman rite is merely a surviving remnant of the same thing, the responses having been preserved, although the prayers have been dropped. Owing to the litany being a form of public prayer specially adapted for and used in public processions, the word *litania* has now obtained among the Greeks the secondary and technical meaning of a *procession*, and the word regularly applied by them to the forms of united prayer conducted by the deacon is *ektonê*.

In the Latin churches the word litany is now used to indicate a special service or form of supplication of medieval origin, in which, after the simple *Kyrie* and the invocation of Christ and of the Holy Trinity, follows a very long string of saints' names, each followed by the response 'Pray for us;' then a series of clauses naming different evils, and a series of adjurations based on events in the life of Christ, both followed in every instance by the response 'Deliver us, O Lord;' and next a series of supplications, beginning 'That it may please Thee, to all of which the response is 'We beseech Thee, hear us.' After this comes the triple invocation of Christ as the Lamb of God, the simple *Kyrie* again, the Lord's Prayer, Psalm lxx., a series of pieces of an intercessory character, and a very large number of prayers or collects. It may be observed that in the medieval editions the names of local saints are generally found mingled with the others. According to the present Roman rule the use of the litany is only absolutely commanded upon the Monday, Tuesday, and Wednesday before Ascension Day, when a procession is made to implore a blessing upon the fruits of the earth, and which are thence called Rogation (or 'asking') Days, and upon St Mark's Day (April 25), when a procession is made to pray for public health during what is in the south an unhealthy part of the year. The litany is, however, ordered upon nearly every occasion of public supplication, such as war, famine, pestilence, &c., and is subject to great alterations, especially after the Lord's Prayer, to meet the special occasions. It is also used on all special occasions, such as ordinations, consecrations, &c., with special alterations, and, in an abridged form, before the Mass on the eves of Easter and Pentecost.

The form of the litany used by Anglicans is a translation of the pre-Reformation one, but extremely free. The invocations of saints and the psalm are entirely omitted. Its use is prescribed

upon all Sundays, Wednesdays, and Fridays, when it is used either as a special service or appended to morning prayer. It is also used at ordinations. It does not possess the same elasticity as the Roman for adaptation to different occasions.

It may be worth adding that in the Latin churches there are also two other litanies, the use of which is permitted in public worship, but which do not form any part of the church service. Both begin like the litany proper. The first is called that of the Holy Name (or sometimes 'of Jesus'). In this the invocation of the Trinity is immediately succeeded by a long series of invocations of Christ under different titles (such as 'Jesus, Good Shepherd,' 'Jesus, King of all the Saints'), with the constant response 'Have mercy upon us.' The other litany is called that of the Blessed Virgin (or sometimes 'of Loretto'). In it the invocation of the Trinity is succeeded by a series of titles addressed to the Blessed Virgin.

There are also a vast variety of other so-called litanies, mostly of French origin, and generally designed to invoke some particular saint under a string of complimentary epithets, on the model of the litany of the Blessed Virgin. Their public use is prohibited, and there is no more guarantee of their doctrinal soundness than may attach to the approval of any bishop given to the book of prayers for personal use in which they may happen to be found.

Litchi, or LEE-CHEE (*Nephelium Litchi*), one of the most delicious fruits of China, Cochin-China, and the Malay Archipelago. The tree which produces it belongs to the natural order Sapindaceæ, and has pinnate leaves. The fruit is of the size of a small walnut, and grows in racemes. It is a red or green berry, with a thin, tough, leathery, scaly rind, and a colourless, semi-transparent pulp, in the centre of which is one large dark-brown seed. The pulp is slightly sweet, subæcid, and very grateful. The Chinese preserve the fruit by drying, and in the dried state it is imported into Britain.

Literary Fund. ROYAL, was founded in 1790 by David Williams, an ex-dissenting minister, the friend of Franklin, Mackintosh, &c., and was incorporated in 1818, its object being to relieve literary men of all nations. In 1889 grants to the amount of £2095 were made to forty authors. From 1790 till 1889 a sum of £109,000 has been thus distributed. The expenditure is met by the subscriptions at the anniversary dinner, and investments: the income was £3850 in 1889.

Litharge. See LEAD.

Lithgow, WILLIAM, Scottish traveller, was born at Lanark in 1582. He had already visited the Shetlands, Bohemia, Switzerland, &c., when, in 1610, he set out from Paris, by way of Italy and Greece, to Palestine and Egypt, performing most of this and his subsequent journeys on foot. His second tramp led him through North Africa from Tunis to Fez and back, and home by way of Hungary and Poland. In his third and last journey (1619-21) to Spain *via* Ireland, he was seized as a spy at Malaga, tortured both by his jailers and by inquisitors, and only released through the agency of the English consul. After he returned to London he became an object of commiseration to the king and his court. Gondomar, the Spanish ambassador, promised him reparation, but contented himself with promising. So Lithgow assaulted, or by another account was assaulted by, him in the king's ante-room, for which he was clapt into the Marshalsea. He died at Lanark, perhaps in 1645. His enthusiastic but most interesting *Rare Adventures and Painful Persecutions* was published in a complete form in 1632 (2th ed. 1814), though an incomplete version came out in 1614. Besides this he wrote accounts of *The Siege of Breda* (1637) and

the *Siege of Newcastle* (1645; new ed. 1820), *Poems* (ed. by James Maidment, 1863), and other works.

Lithic Acid. See URIC ACID.—*Lithic Acid Diathesis* is the term employed in medicine to designate the condition in which there is an excess of lithic (or uric) acid, either free or in combination, or both, in the Urine (q.v.).

Lithium (sym. Li; equiv. 7.0; sp. gr. 0.5936) is the metallic base of the alkali *lithia*, and derives its name from the Greek word *lithos*, 'a stone.' It was discovered by Arfvedson in 1817 in some Swedish minerals; but since the introduction of spectroscopic research it has been found to be widely present in many mineral waters, in the ash of plants, &c. The metal is of a white, silvery appearance, and is much harder than sodium or potassium, but softer than lead. It admits of being welded at ordinary temperatures, and of being drawn out into wire, which, however, is inferior in tenacity to leaden wire. It fuses at 356° (180° C.). It is the lightest of all known solids, its specific gravity being little more than half that of water; it decomposes water at ordinary temperatures. It burns with a brilliant light in oxygen, chlorine, and the vapours of iodine and bromine. It is easily reduced from its chloride by means of a galvanic battery. When lithium is burned in air it forms an oxide, lithia, Li₂O, along with a trace of a higher oxide. This oxide, when treated with water, yields a hydrate, LiOH, having alkaline properties and resembling soda and potash. Lithia forms a series of salts (carbonate, chloride, citrate, &c.) analogous to the potash and soda salts, and all of these, when placed in the flame of a Bunsen burner and examined with the spectroscope, show characteristic red bands by which their presence can always be ascertained.

In medicine the salts of lithia hold a high place as solvents of uric acid. The carbonate and citrate are used for this purpose, and are said to be much more efficient in cases of gout and gravel than the potash salts.

Lithography (Gr. *lithos*, 'a stone,' and *graphein*, 'to write'), the art of printing from stone, and one of the most important of the reproductive arts, was invented in 1796 by Aloys Senefelder (1771-1834). In that year a piece of music—Senefelder's first work—was printed from the stone, and in 1800 he patented his invention in Bavaria, most of the German states, and Austria. Afterwards he opened establishments in London and Paris, but did not succeed very well. The great secrecy and jealousy with which the new art was guarded by its patentees prevented progress being made, and it was not till many years afterwards that their complicated manipulation became sufficiently simplified for the rapid advance which then became possible. Senefelder, on whom the king of Bavaria settled a pension, lived to see his invention brought to complete perfection.

The principles on which lithography is founded are (1) the strong adhesion of greasy substances to calcareous stone; (2) the affinity of one greasy body for another, and their antipathy to water; (3) the facility with which calcareous stone imbibes water. It follows that, if a greasy line be drawn on a prepared stone, its adhesion is such that it can only be erased by entirely removing the surface of the stone so far as the grease has penetrated. If water be put on the surface of the stone it remains on those parts not covered with grease; a roller charged with greasy ink may then be passed over the stone, the ink adhering to the greased portions, while the parts wet with water will repel the ink and remain clean. A piece of paper put on the stone, if pressure be applied, will receive an impression in ink of the greasy line. The covering

of the stone with a solution of gum-arabic (to be afterwards described) is an almost indispensable aid to the water in resisting the ink.

There are various methods employed in lithography: drawing on stone with pen or brush with liquid ink; drawing on paper, and transferring to stone; engraving on stone; drawing on stone with crayons or solid ink, transferring from engraved plates or woodcuts, &c. These differ only in the manner of applying the greased drawings to the surface of the stone. The printing from them is in nearly all cases identical.

The Stones.—The immense quarries of Solenhofen in Bavaria furnish the best stones; others of inferior quality are obtained in France and Italy. The stones are composed of lime, clay, and siliceous earth, and are of various hues, from a pale yellowish-white to a light buff, reddish, pearl-gray, blue, and greenish colour. Those of a uniform gray colour are the best. They are found in beds, commencing with layers of the thickness of paper; the thickness required for printing-stones being from about 2 to 4 or 5 inches. When in the quarry they are soft and easily cut to any required size. They are afterwards ground face to face with sand and water, and when quite level polished with pumice-stone, and finally with smooth polishing stone. Sheets of zinc faced with thin coatings of artificial stone have been introduced, but not as yet with much success.

The writing and drawing inks and crayons are composed of lard, hard soap, white wax, shell-lac, Venetian turpentine, carbonate of soda, and Paris black. The proportions used and the methods of manufacture vary considerably. All descriptions can be purchased ready prepared. The greasy ingredients are the important parts; the black is only added to enable the artist to see the effect he is producing as he goes on.

Writing or drawing on stone is performed with a fine pen or brush, or a ruling pen for straight lines. The ink is rubbed down with a little water and under gentle heat, in the same manner as China ink, and the subject may be traced as for a drawing on paper. Great care is necessary in handling the stone, as its affinity for grease is so keen that a finger-mark would develop into a black blot in printing. When the drawing is finished it is covered over with a solution of gum-arabic in water. This gumming fills up the pores of the stone on the undrawn parts, and prevents the greasy lines of the drawing from spreading. The stone is then removed to the printing-press and prepared for printing. The gum is first washed off with clean water, enough remaining in the pores of the stone, however, to assist the water to resist the ink in the subsequent printing. The stone is then damped with a canvas cloth, and a roller (made of wood or iron, covered with one or two thicknesses of flannel and an outer covering of fine leather) charged with printing-ink is passed over the stone till every part of the drawing is thoroughly inked. Any accidental grease or finger-marks will now become visible, and must be removed with acid, scraping with a knife, or polishing with polishing stone. When the drawing is made satisfactory the stone is washed over with a weak solution of nitric acid in gum-water. This *etching*, as it is called, is a very important operation. If applied too strong the acid would remove the drawing completely from the stone; but when diluted to the proper strength it gently eats away the surface of the bare parts of the stone, opening up the pores for the better reception of the gum to be afterwards applied, thoroughly cleans it from grease soils, and sharpens the lines of the drawing. When the stone is sufficiently etched the acid is washed off and another coating of gum applied; when this is

dry it is again washed off, and, usually, to clean the stone from the drawing-ink, the surface is washed with turpentine. For all that can be now seen on the stone the work is quite lost; but it is only the black ink that is washed off; the *grease* lines are *in* the stone, which is all that is necessary. The stone is now damped with a cloth and inked with a roller till all the drawing is black again; a piece of paper is placed on the top, passed through the press, and when taken off has received an impression of the drawing. The damping and inking is repeated for every impression, and when the stone is put away or left for a time it is, for preservation, covered with the indispensable gum, which is again washed off when printing is resumed. The ink for black printing is composed of Paris black, ground up with varnish made from boiled linseed-oil.

Writings and drawings made on prepared paper and transferred to stone for printing are, perhaps, the most important items in general lithographic work. The transfer paper is prepared on one side with a coating of isinglass, flake-white, and gamboge, and afterwards smoothed by passing several times through a press over a heated stone. The writing or drawing is made on this preparation with a pen or fine brush with the lithographic transfer ink, and when finished is transferred to the stone in the following manner. The paper is put for a few minutes between damped blotting-paper. A *warmed* polished stone is put in the press, the paper is placed with the coated side upon it, and passed several times through the press, after which the paper is damped with water and gently rubbed with the fingers till it comes easily off, leaving the drawing adhering to the stone. The stone is gummed over and proceeded with as already described. After the first inking-up, and before etching, any defects in the transfer can be touched up with a pen or brush. In France and some other countries this class of work, however, is generally either directly drawn or engraved on the stone.

Fresh impressions of lithographs, of engravings on wood, steel, or copper, and of letterpress may be transferred to and printed from the stone by the above process, the paper used being prepared with a special composition, and the ink a mixture of the writing and printing inks. Many subjects, such as music titles, &c., are engraved cheaply on zinc, expressly to be transferred to stone. When the design is small and required in large numbers, it may be transferred many times on one stone, and many printed on one sheet of paper at every impression.

Engraving on stone, so called, is another method of putting a drawing on stone, and is as follows. A polished stone is covered with a coating of gum slightly coloured; this is afterwards roughly washed off, leaving only a very thin film of the gum, which can be easily cut through. On this ground the drawing is executed with etching-points of diamond and steel of various breadths, exactly as in etching, the surface of the stone being cut through the gum in making the lines. When the drawing is finished any greasy matter is rubbed into the lines and allowed to remain an hour or two till the stone has imbibed enough at the lines. The gum is then washed off, and the stone damped and inked and proceeded with as above, except that engraved stones are generally inked with a dauber, i.e. a piece of wood covered with one or two pieces of flannel, with which the ink is rubbed into the lines.

The following modification of this process is very useful when a photograph or drawing has to be copied in line on the stone. A thin sheet of gelatine is placed over the subject to be copied, and, it being transparent, a careful drawing may

be made on it with etching-points. When finished, lithographic ink is rubbed into the lines and the gelatine placed on the stone and the drawing transferred by passing through the press. The weak point of this process is that the gelatine is apt to warp on the stone and spoil the transfer; in which case the drawing is lost.

Chalk-drawings were, before the invention of the steam lithographic press, and still on rare occasions are, drawn on grained stones. The grain, coarse or fine as required, is imparted to the stone by grinding with sand of varying degrees of fineness. The drawing is made on the stone with lithographic crayons in the same manner as the ordinary drawing chalks on ordinary crayon-paper; when finished it is proceeded with as before. Very beautiful work can be produced in this way; but as, owing to various causes which are too technical for our space, the grained stone cannot be printed at the steam-machine, and hand-press printing is too expensive for modern requirements, such work is now almost invariably executed by the *grained-paper process*. A sheet of copper or other metal is grained on the surface by aquatint, stipple, or ruling-machine; paper, coated with a white transferring ground, is passed through a press on the face of the prepared plate, becomes impressed with the grain, and may be drawn on with lithographic chalks in the same way as a grained stone. This drawing is transferred to a *flat* or polished stone in the same manner as writing or pen drawing, and printed in any lithographic press. Very good work is produced by this process, but the result of the somewhat artificial grain of the copper-plate is inferior to the beautiful grain of the ground stone. In the United States drawings are made on grained stones and impressions transferred to flat stones for printing; but this process has not found much favour in Great Britain.

Photo-lithography is a very useful method of reproducing in any size, for stone printing, existing drawings, such as architects' plans, maps, &c. A photo-negative of the required size is taken from the drawing to be reproduced, and is exposed to light over a thin film of bichromatised gelatine on paper. The paper, after being soaked in water, which takes out the bichromate unaltered by the light, is stretched on a sheet of glass and carefully inked with a velvet roller. The ink only adheres to the parts rendered insoluble by the light, and which have remained dry during the soaking, and leaves the soluble parts, which are wet, quite clean. This is transferred to stone in the ordinary manner.

Chromo-lithography is the most beautiful of all the methods of printing from stone. The object being to produce, as nearly as possible, fac-similes of pictures in colour, it is necessary to employ a number of stones, in some cases as many as twenty or thirty, each printing a separate tint, to produce the infinite variety of colour in a finished colour-drawing. The usual method of procedure is as follows. A careful outline of the entire design is drawn on, or transferred to, a stone; from this, called the *key*, as many copies are printed as there are colour-stones required. These impressions are dusted with dry black or rubble, and, being set off on the colour-stones, form guides to the artist in drawing in the various colours; after which the key lines can be washed away with water. On one of these stones the general effect of the picture is sometimes drawn, and this, printed in a neutral gray, forms the basis of the finished print. The other stones are drawn separately to correspond with the different colours required to produce the necessary effect. It will be easily understood that in arranging the various colours with their varying degrees of depth on the different stones, the proper amount of force to be given to each, and the effect

likely to be produced by printing one tint over another, have to be considered, and give scope for a great deal of professional skill. There are many different methods of drawing the tints on the stone which are too technical for our limits. The finest work is done by stipple, drawn by hand with a fine brush, a method in which French and German artists on stone are very skilful. The colour stones are printed in the manner already described, except that coloured inks are used instead of black. The different colours, varying in number from four or five to twenty or thirty, being printed by separate impressions on the same paper, it is obvious that great care is necessary to see that every impression is exactly fitted to the others, or exactly *registered*, as it is called. Several mechanical appliances are used to secure this exactness. When the necessary number of impressions have been printed and the stone has to be cleaned for another subject, the surface must be laboriously polished down till every vestige of grease is removed.

Such is a brief outline of the different methods employed in lithography, but each method is capable of infinite number of variations in the hands of different operators.

Lithographic presses vary as much in construction as those for the letterpress. The hand-press is very simple. The stone is placed on a movable table, and a *typoan*, an iron frame covered with leather, folds down over the paper when placed on the stone. It is then rolled under the *scraper*, generally a piece of boxwood fixed in an upright, which applies the pressure. The damping and inking are done by hand.

The first self-acting lithographic machine, introduced into Britain by Siehel of Berlin and Vienna, failed from the fact that it was constructed, like the hand-press, with a scraper arrangement for the impression. This produced too much friction, rendering speed dangerous, and work difficult to keep on the stone; and it was not till about 1860 that the machine as at present in use, with a cylinder for the pressure, was introduced from France. It is somewhat an adaptation of the letterpress single-cylinder machine (see *PRINTING*), and a very brief description will suffice. The stone is placed on a movable bed, which can be raised or lowered according to the thickness of the stone. The sheet is fed in at the top of the cylinder, whence a gripper arrangement leads it over the stone. At one end are the damping-rollers, which are covered with some soft absorbent fabric; and at the other the inking-rollers, covered with the finest French leather, with inking-table, duct, and distributors. The stone passes first under the dampers, then to the inking-rollers, thence back to the cylinder to print the impression, and so on *ad infinitum*.

Zincography, the invention of Eberhard of Bavaria, is an application of lithography to zinc plates instead of stones, with some necessary modification of the etching and printing. Its only advantage is in connection with very large subjects, as the zinc is more portable and less liable to breakage than stone.

See G. A. Audsley, *Chromo-lithography*, a popular treatise (44 plates), and W. D. Richmond, *The Grammar of Lithography and Colour and Colour Printing as applied to Lithography* (6th ed. 1887), both in Wyman's Techn. Series.

Lithology (*lithos*, 'a stone') is a name sometimes used for that division of geology which considers the constitution and structure of rocks, apart from their relations in time or position to each other. See *GEOLOGY*.

Lithomarge, an earthy or clay-like mineral substance, sometimes called *Mountain Marrow*

(Ger. *Steinmark*), consisting chiefly of silica and alumina, with oxide of iron and various colouring substances, derived from the decomposition of various minerals. It is soft, greasy to the touch, and adheres strongly to the tongue. It is generally white, yellow, or red, often exhibiting very beautiful colours. It is found in Germany, Russia, &c., also in the tin-mines of Redruth in Cornwall.

Lithophagida (Gr., 'stone-eaters'), a term sometimes applied to the molluscs which bore holes for their own residence in rocks. See BORING-ANIMALS.

Lithotomy (Gr. *lithos*, 'a stone;' *tomē*, 'the act of cutting'), the technical name for the surgical operation popularly called *cutting for the stone*. As most of the symptoms of stone in the bladder (which are noticed in the article CALCULUS) may be simulated by other diseases of the bladder and adjacent parts, it is necessary to have additional evidence regarding the true nature of the case before resorting to so serious an operation as lithotomy. This evidence is afforded by *sounding* the patient—a simple preliminary operation, which consists in introducing into the bladder, through the natural urinary passage (the urethra), a metallic instrument, by means of which the stone can be plainly felt and heard.

Lithotomy has been performed in various ways at different times, both in the perineum and above the pubes. The earliest form of lithotomy is known as *cutting on the gripes*, or *Celsus's method*. It received the former name from the stone, after being fixed by the pressure of the fingers in the anus, being directly cut upon and extracted. The *Morison method*, founded on the erroneous idea that membranous parts would not heal after incision, while their dilatation was comparatively harmless, was the operation mainly in vogue for nearly 200 years, till Frere Jacques introduced what is essentially the method now in use. Cheselden (1727) and Liston in the first half of the 19th century perhaps most deserve mention among the many surgeons who have subsequently improved upon the original operation.

The *lateral operation*, so called from the lateral direction in which the incision is made into the skin of the perineum and the neck of the bladder, in order to avoid wounding the rectum, is that which, with various minor modifications, is generally employed at the present day. Frere Jacques seems to have devised the method and to have practised it with much success; and in 1702 he published a description of it. The advantage of this operation, by which a free opening, sufficiently large for the extraction of all but very large stones, can be made into the bladder without laceration of the parts or injury to the rectum, was immediately recognised by the leading surgeons of the time, and the Marian process was at once universally given up. Other varieties of the perineal operation are termed median, bilateral, &c.

The *suprapubic* or *high* operation was first performed by Pierre Franco in 1561, and has occasionally been employed ever since. It has recently been proposed by some surgeons to use it in preference to perineal lithotomy in the majority of cases; but it is generally reserved for stones of large size which cannot be crushed and are difficult to remove through the outlet of the pelvis.

From the shortness of the female urethra and the extent to which it can be dilated, and, additionally, from the comparative rarity of calculous affections in women, the operation of lithotomy is seldom required in the female sex.

The danger of the operation increases with the age of the patient. Statistics of 1827 cases of lateral lithotomy in England, collected by Sir

Henry Thomson, show a mortality gradually rising from 5·7 per cent. in the patients under twelve years of age to more than 31 per cent. in those over seventy. The more general adoption of lithotomy has greatly diminished the number of cases in which lithotomy has to be resorted to.

Lithotrity (Gr., 'stone-crushing'), the surgical operation of breaking up a stone in the bladder into such small fragments that they may readily be expelled by the urethra. Although the importance of such an operation has been recognised from the earliest time, a French surgeon, Civiale, who commenced his researches in 1817, but did not perform his first operation till 1824, may be regarded as the discoverer of lithotrity. The instrument by which the disintegration of the stone is effected is introduced in the same manner as a catheter or sound into the bladder, and, after catching the stone, either bores, hammers, or crushes it to pieces. The stone is grasped by the blades of such an instrument as that shown in the figure, and the blades are then forcibly approximated to each other by means of a screw. The various fragments are gradually broken down in the same way till they are small enough to be discharged through a catheter introduced for the purpose.

Since the operation was first introduced, the instruments employed both for crushing the stone and for evacuating its fragments have gradually been improved; and experience has shown that this method is capable of superseding lithotomy in the adult in the vast majority of cases where an operation for stone is necessary.

It used to be considered advisable in the case of all but very small stones to crush and remove only a portion of the calculus at one time. To Bigelow of New York belongs the credit of recommending (in 1878) the method now adopted by almost all surgeons. He gave it the name of *litholapaxy* ('stone-evacuation'), but it only differs from lithotrity in that the procedure is completed at one sitting. This improvement was an outcome of the teaching of Otis of New York, who found it possible to introduce instruments of larger size, and therefore more effective than had been previously considered safe.

In adults the only conditions which generally make lithotrity inadvisable are 'extreme size, with hardness of structure in the calculus itself, and continued narrowness or other obstruction in the urinary passages, rendering the employment of adequate instruments impossible' (Sir H. Thomson). In children the risk attending lithotomy is much less than in adults; but the difficulties of lithotrity, in consequence of the small size of the urethra, are much greater; in boys, therefore, the former operation is still generally preferred, except in the case of very small stones.

Lithuania, a former grand-duchy of Europe, composed of three groups of territory: (1) Lithuania proper, or Litva, corresponding to the modern Russian government of Vilna, with Troki; (2) the duchy of Samogitia; (3) Russian Lithuania, comprising Polesia, Black Russia or Novogodok, White Russia or Minsk, Meislav, Vitebsk, Smolensk, Plotzk, and Polish Livonia. But in the 15th century Lithuania extended as far south as Odessa and the Sea of Azov, and as far east as the river Moskva. The Lithuanians, a race to whom belong the Letts (q.v.) of Livonia, the Courrs of Courland, and the Bessarabians or ancient inhabitants of East Prussia, constitute one of the main divisions of the Indo-

European stock; to them are sometimes added the Yatvyags or Yadvings, who dwelt on the upper tributaries of the Bug and Niemen, thus making about 3½ millions in all. The Jmuds, 700,000 in number, are a branch of the Lithuanians proper. The Lithuanian tongue is spoken by about 1½ million; in some respects it comes nearer Sanskrit than any other Aryan language, though it contains a strong admixture of Slavonic words. Along with Lettish and the extinct Old Prussian it constitutes the Baltic family of the Aryan branch of languages. Owing to its many archaic forms and the early stage of its development, it possesses great value for students of comparative philology. The literature is exceptionally rich in poetry, popular tales, &c. The poetry is frequently full of the very breath of nature. See works by Schleichler (1854 to 1876) and Bozzenberger (1877 and 1882), and collections of songs by Rhesa and Kirschat (1843), Nesselmann (1855), Brugmann and Leskien (1882); Veckenstedt's *Mythen, Sagen*, &c. (1883); Ch. Bartsch, *Litauische Melodien* (2 parts, 1887-90). A Lithuanian literary society was formed in Tilsit in 1879.

As a race the Lithuanians are fair and well built, with fine features and blue eyes. They have strong religious temperaments, and, though they belong to the Roman Catholic and Greek Catholic churches, they cling tenaciously to heathen reminiscences and customs. They have been kept in a state little superior to serfdom by German and Polish land-owners, but since 1863 the Russians have allowed them to become, to some extent, owners of the soil. Agriculture, cattle-breeding, and bee-keeping are the principal occupations. The country they inhabit is covered with vast primeval forests and with numerous marshes and lakes. These circumstances have impressed traits of peacefulness, melancholy, and loneliness, but at the same time of sweetness, upon both the national character and the national songs. For many centuries worship was performed in the forests, and great oaks are still objects of religious veneration. They have never had any towns, only villages, and have always relied for protection upon the dense forests and the extensive marshes. Nothing authentic is known as to the history of this people prior to the 13th century. The first prince to gather the scattered tribal chiefs around him was Ringold (1230-35); his policy of centralisation was continued by his son Mindovg (died 1263), who even consented to be baptised, but afterwards apostatised. During these reigns the Lithuanians waged almost incessant war against the Livonian order and the Teutonic Knights (see LIVONIA). Olگرد (1315-77), after reviving (along with his brother Keistut, the legendary national hero of the Lithuanians) the principality of Lithuania, extended his conquests into southern Russia. His son Jagiello (1377-1434) married the heiress of Poland (q.v.), thus forming the first link of connection between these two states; the last link was welded in 1569 by their complete political unity. In the interval Lithuania had been governed by grand-dukes appointed by the king of Poland. By the three partitions of Poland Russia acquired the bulk of the grand-duchy (Polotsk, Troki, Brest, Novogorod Syversk, and the governments of Grodno, Kovno, Vilna, Moghileff, Vitobsk, Minsk); the rest fell to Prussia, but passed in 1814 to Russia. See *Histories* by Schlozer and Gebhardt (Berlin, 1785) and Ledewit (Paris, 1861).

Litmus is a well-known colouring matter, which is obtained from several lichens, but chiefly from *Lecanium tataricum*. The lichens are powdered and digested with ammoniacal fluids (urine, for example) till they undergo decomposition. Alum, potash, and lime are then added, and the mixture is allowed to stand till the maximum degree of colour

is observed. Sand and chalk are added to give a due degree of solidity, and the mass is then dried in cubes, and is ready for the market. The exact nature of the changes which ensue is not altogether known; it is, however, certain that the pigment is originally red, and that it only becomes blue on the addition of alkalis or of lime. This blue colour is again changed into a red on the addition of a free acid. The use of litmus-paper and tincture of litmus for the purpose of detecting the acidity of fluids, &c. is known to every student of chemistry. See TEST-PAPERS.

Litre, the unit of the French measures of capacity, both dry and liquid. It is the volume of a cubic decimetre (see METRE), and contains a kilogramme of water at 39.2 (4 C.) in a vacuum; it is equal to 0.2200967 British imperial gallon, and is therefore less than a quart. 4½ litres being roughly equal to a gallon. The litre is subdivided decimally into the *decilitre*, *centilitre*, and *millilitre* (respectively $\frac{1}{10}$ th, $\frac{1}{100}$ th, and $\frac{1}{1000}$ th of a litre). Ten litres make a *decalitre*: 100, a *hectolitre*: 1000, a *kilolitre*. The hectolitre is the common measure for grain, and is equal to 0.3439009 British imperial quarter, or nearly 2½ imperial bushels.

Little, THOMAS. See MOORE.

Littleborough, a town of Lancashire, 3½ miles NE. of Rochdale, of which it is virtually a suburb, and in the manufacturing industries of which it shares. Pop. of parish, 10,496.

Little Falls, a post-village of New York, on the Mohawk River, 73 miles WNW. of Albany, on the line of the Erie Canal and of two railways. The Mohawk here passes through a narrow rocky gorge, with falls of 44 feet, giving water-power to several mills and factories. Pop. 8910.

Littlehampton, a seaport and watering-place on the coast of Sussex, 18 miles W. of Brighton and 63 SW. of London. It is the port for Arundel. Pop. 3926.

Littlemore, a hamlet 2½ miles SSE. of Oxford, famous for its associations (1828-43) with Newman.

Little Rock, the capital of Arkansas, is situated on the south bank of the Arkansas River, 280 miles from its mouth, and 345 miles by rail SSW. of St. Louis. It contains the state capitol, prison, and asylum for the blind and deaf mutes, a United States arsenal, a Roman Catholic cathedral, court-houses, a university, a medical school, &c. Pop. (1880) 13,138; (1890) 25,874.

Littleton, or LITTLETON, SIR THOMAS, English jurist, was born in 1402 at Frankley House, near Bromsgrove, Worcestershire, his mother being the heiress of Thomas de Littleton, lord of the manor of Frankley. He was recorder of Coventry in 1450, king's sergeant in 1455, in 1466 judge of common pleas, and in 1475 a knight of the Bath. He died on 23d August 1481. Littleton's 'authentic reputation' (Fuller's phrase) rests on his work on *Tenures*, which was originally written in Norman-French, or rather law French. It treats of the English law relating to rights over land, and was the first scientific attempt to classify the subject. It seems to have been first printed in the year of its author's death, if not before, and passed through numerous editions. The first translation into English was made probably as early as 1500. It was the original text that Coke commented upon in his famous *Coke upon Littleton* (see COKE). The changes in the laws relative to property have greatly diminished its value, and it is now little studied by lawyers; yet it is considered a model from the clear and logical manner in which the subject is handled.

Littoral Deposits, accumulations formed in shallow water along a shore line. They are

generally gravelly and arenaceous in character, and exhibit rapid alternations of finer and coarser grained materials.

Littré, MAXIMILIEN PAUL EMILE, an eminent French philologist and philosopher, was born in Paris, 1st February 1801. He first studied medicine, but ere long gave himself to philology, mastering Sanskrit, Arabic, Greek, and the chief modern languages. One of his first tasks was a translation of the works of Hippocrates (10 vols. 1839-61), which at once opened for him the door of the Academy of Inscriptions. Littré held democratic opinions, distinguished himself on the barricades in 1830, and was one of the principal editors of the *National* down to 1851. He embraced Comte's Positivism with great ardour, and defended it ably in pamphlets and in journal articles, but he did not share the disciples' indiscriminating enthusiasm for the Master's later works. Disappointed at the results of 1848, he retired from active politics, resigning even his office of municipal councillor of the city of Paris. Returning to a life of study, Littré continued his researches in the history of medicine, at the same time working ardently at the history of the French language. His article, *La Poésie Homérique et l'Antique Poésie Française* (1847), attracted great attention. It was an attempt at the translation of the first book of the *Iliad* in the style of the Trouvères. The Academy of Inscriptions chose Littré, in place of Faurlé, in 1844, to be one of the commission charged with continuing *L'Histoire Littéraire de France*, and he is one of the authors of vols. xxi.-xxiii. In 1854 he was appointed editor of the *Journal des Savants*. Littré's principal work is his *Dictionnaire de la Langue Française* (4 vols. 1863-72; supplement, 1878), a monument of patience and erudition. This splendid work—the real *thesaurus* of the French language—did not prevent the French Academy in 1863 from rejecting its author, whom Bishop Dupanloup denounced publicly as holding immoral and impious doctrines. Just before the siege of Paris Littré's friends compelled him to quit the capital. In January 1871 Gambetta appointed him professor of History and Geography at the École Polytechnique. Next month he was chosen representative of the Seine department in the National Assembly, where he sat with the party of the Left. On the 30th December 1871 the French Academy at last admitted him to membership; whereupon Bishop Dupanloup resigned his seat. Littré published *Médecine et Médecins* in 1872. In 1875 he received honours from Leyden and from the Austrian Academy. He died at Paris, 2d June 1881.

Other works of Littré's were: French translations of Strauss's *Life of Jesus* (1839-40) and of Pliny's *Natural History*; *Histoire de la Langue Française* (2 vols. 1862); *Parole de Philosophie Positive* (1859); *Auguste Comte et la Philosophie Positive* (1863); *Auguste Comte et Stuart Mill* (1865); *La Science au Point de Vue Philosophique* (1873); *Littérature et Histoire* (1875); *Éléments de Philosophie Positive et de Sociologie Contemporaine* (1876); and *Œuvres Complètes d'Arnould Carrel* (1857). His *Études et Mémoires pour servir à l'Histoire de la Langue Française* (1880) contains an interesting account of the origin of his great Dictionary. See also Sainte-Beuve's *Notice sur M. Littré* (1863); the *Edinburgh Review* (1882); and the *Century* (1884).

Liturgy, a word derived from the Greek *leitourgia*, signifying originally a 'service,' such as those rendered by citizens to the state. By the translators of the Septuagint it was applied to public worship, and among the Greeks the sense is now limited to the celebration of the eucharist. The word at one time enjoyed a wider signification, and in English the term liturgy is still sometimes loosely used to indicate a general body of forms

for public worship prevailing in a particular community; but by the more correct writers it is used in the same exclusive sense as is the original by the Greeks. The present article is designed briefly to sketch the history and development of the forms used in the celebration of the eucharist or Lord's Supper, exclusive of those employed only by Protestants.

With regard to the form used by Christ Himself (Matt. xxvi. 26-28; Mark. xiv. 22-24; Luke. xxii. 19, 20; 1 Cor. xi. 23-25) only three features are recorded, besides the taking hold of the bread and the cup. These are that He (1) gave thanks (*eucharistias*) and blessed, that (2) He brake, and that (3) He administered. To these we must necessarily prefix, on any subsequent occasion, the laying of the table and the placing upon it of bread and wine. It appears from Acts, xx. 7, 12, that the ceremony was preceded by a sermon or discourse, and from 1 Cor. xiv. 16 that the blessing was regarded as identical with or part of the thanksgiving (*eucharistia*), which was the name given to the whole of the principal formula; while we learn from Tim. ii. 1, 2, that the thanksgiving contained a prayer for all men, and from 1 Cor. xiv. 16 that at the conclusion of the thanksgiving the word 'Amen' was answered. The New Testament also contains no less than five directions (Rom. xvi. 16, 1 Cor. xvi. 20, 2 Cor. xiii. 12, 1 Thess. v. 26, 1 Pet. v. 14) with regard to the giving of a religious kiss, and it is hard to escape the conclusion that this ceremony must have been associated with the principal act of worship, the eucharistic celebration.

Whether any such thing as a liturgy had yet been committed to writing in the time of the apostles is unknown. At any rate it is evident from 1 Cor. xiv. 16 that the use of a fixed form was not obligatory. Moreover, there are certain passages that occur both in the writings of St Paul and in the so-called Clementine liturgy, which, in the judgment of some of the most eminent critics (notably Dr Neale), appear from the context in each case to be quoted in the epistles from the liturgy, and not in the liturgy from the epistles. It is a plausible conjecture that a form or forms may have been drawn up as models, without the celebrant being tied to their strict use.

The martyr Justin in his first defence of Christianity gives a scanty and confused account of the liturgy, from which, however, it is possible to gather the six points above mentioned, with three additional facts—viz. that portions of the Old and New Testaments were read before the sermon, that after the sermon there were prayers of an intercessory character, and that the kiss was given after these prayers and before the bread and wine were placed upon the table. Justin also mentions that the thanksgiving was very long.

Some words used by Justin may mean that in his day a custom already prevailed which in any case was certainly in force very soon after. This was the rule of secrecy (*Disciplina Arcaica*, q.v.) by which all unbaptised persons, including those who were actually under preparation for baptism (*catechumens*), were dismissed from the assembly as soon as the sermon was over, and which was later extended so as to conceal from them as far as possible the knowledge of what afterwards took place. This rule has caused Western writers to divide the liturgy into two parts, the first, up to the sermon inclusive, being termed the Mass of the Catechumens (*Missæ Catechumensium*), and the rest the Mass of the Faithful (*Missæ Fidelium*). Other persons unfit to be present at the celebration were dismissed at the same point. This twofold division made by western writers must not be confused with a twofold division made by the Easterns, who call all the portion which follows the commencement of the

thanksgiving by the distinctive name of the *Anaphora* ('offering'), whence the terms Pro-Anaphora and Anaphora to distinguish the two portions.

The Clementine liturgy is found embedded in the compilation called the Apostolic Constitutions (q.v.). It is not known where it was used, but as it is in striking harmony with the account given by Justin, who was writing at Rome, it seems probable that it is the form once used at any rate in that city.

The rule of secrecy is probably the main reason for the extraordinary scantiness of allusions to the eucharist among early Christian writers. Into these it is needless to enter here. It suffices to say that all known liturgies later than the so-called Clementine are divisible into five distinct schools, called respectively the Roman and the Ephesian, which are Western, and the Hierosolymitan, the Babylonian, and the Alexandrian, which are Eastern. All these, however, show their common origin by consisting of certain main parts, although all do not contain all these parts, and the parts themselves are not always arranged in the same order. These parts are of course called by different names in different countries; those used by English scholars, which are mostly derived from those of the Roman liturgy, will be here given in brackets, and generally employed. The ceremony ordinarily begins with some opening hymn (introit), and there is often a short litany, always with the Greek response of *Kyrie eleison*. There is often, also some confession or acknowledgment of sin and prayer for pardon. There is then a prayer or prayers, and some portions of the Scriptures are read, interspersed with psalms or hymns, and ending with a reading from the Gospels, after which is usually preached the sermon, if there be one. The next stage (offertory) is the spreading upon the altar of a piece of linen or silk (corporal), and the placing of the bread (host) and wine upon it, except in the case of the pure Alexandrian form, where this is done first of all. Except among the Armenians, a few drops of water are added to the wine. There are in any case some prayers. After this, except in the Roman school, the kiss (Pax, 'kiss of peace') is given. The thanksgiving is then introduced with some form of the words, 'Lift up your hearts' (*Suscina corda*)—Answer, 'We lift them up unto the Lord;' 'Let us give thanks unto our Lord God'—Answer, 'It is meet and right.' The first part (preface) of the thanksgiving always closes with some reference to the angels who never cease to cry aloud, and here the people join in singing some short hymn, beginning 'Holy, holy, holy, Lord God of Sabaoth' (*Sanctus* or Triumphant Hymn). The continuation (canon) of the thanksgiving then comes to a rehearsal of the circumstances of the institution of the eucharist, reciting the words of Christ (consecration), and this again is followed by a brief remembrance of His life, and by a particular prayer, which will be spoken of hereafter. The thanksgiving closes with a short doxology, and 'Amen' is answered. The Lord's Prayer is then said, either before or after which the Sacrament is broken, and a portion put into the chalice. About this point the sacrament in both kinds is often lifted up (a ceremony properly termed the Elevation, but now often the Little Elevation), as though to invite the communicants to approach, and the words 'the holy to the holy' are usually uttered. In the Roman school the kiss is given now. Next comes the administration of the communion, preceded by some prayers of preparation, and accompanied or followed by a psalm or hymn. The whole service ends with prayers of thanksgiving for the communion received (post-communion), and a benediction. It will be remarked that in the above sketch

one important feature is not mentioned—viz. the prayer for all men (the Great Intercession). It occurs in all the liturgies, but it is placed at different points, and it is in the particular point at which this prayer occurs that the difference between them mainly consists. All the liturgies also have adopted the use of the Nicene Creed, though they differ as to the point at which they interpolate it; but, as the creed itself dates only from the 4th century, and forms no integral part of the ceremony, this is a matter of little moment. It is to be remarked that in all the rites some portions of the service (even such as are not personal to himself) are said by the priest inaudibly (*secretis*), a singular custom which may perhaps have arisen after the introduction of congregational singing, and owe its origin to the desire, on the one hand, not unduly to protract the service, and, on the other, not to omit either the singing or the prayers.

In the West the use of the word liturgy has been almost entirely superseded, except in the disquisitions of the learned, by some form of the word which appears in Latin as *missa* and in English as *mass*. The derivation of this word has been disputed, but it is admitted that it is connected with the proclamation, *He: missa est*, often made at the end of the Roman mass, and it may now be regarded as certain that it is a mere corruption of *missio*, and means simply a dismissal. In the Western rites the bread is always unleavened. The language is normally Latin, which was the common literary tongue when these rites were composed, and has never been changed. They have a custom, introduced about 1100 A.D., that, immediately after the utterance of Christ's words of institution, in each case the celebrant should lift the sacrament above his head, and this is now commonly called by Westerns the elevation, while the true elevation, or lifting of the sacrament, as though to intimate that the moment of communion is at hand, is by them called the Little Elevation. By a custom sanctioned in the 15th century, the celebrant only (with the exception of the kings of France at their coronation, and a few of the assistants at a papal high mass) communicates from the chalice. The manner of conducting the service is divided into High, Sung, and Low Mass. A High Mass is sung, with a deacon, sub-deacon, and other assistants, and the use of incense. A Sung Mass is sung by the priest and choir or congregation, but there is only one clerk and usually no incense. A Low Mass is read by the priest with one clerk, and without either music or incense. A Low Mass occupies about half an hour, the others (with simple music) about three-quarters of an hour. Very many priests celebrate it every day, so that it sometimes takes place scores of times in the same church on the same day.

(A) The Roman liturgical family is often called the Petrine, and is traditionally ascribed to the apostle Peter. It is certain, however, that the early Roman Church was a Greek church. When its liturgy became Latin is unknown; possibly the Latin liturgy is of African origin. There is no trace of the change before the 4th century. The distinctive features of the Roman family are the peculiar position of the Pax, and that the great intercession (except the prayer for the dead, which has perhaps, however, been misplaced) occurs between the Sanctus and the Consecration. It is represented by two main rites.

(a) The Roman. This is the common Roman mass familiar in most parts of the world. The Roman liturgy has several varying forms, such as that used by the Dominicans (who, as in the Alexandrian school, place the bread and wine on the altar at the beginning) and the Carthusians. These preserve the usages of particular times and places in the middle ages, as was also the case with

the Sarum, the Aberdeen, and other medieval rites. There are also some French variations, especially that of the church of Lyons, but their peculiarities may have to do with survivals from the Gallican (see below). It has also been translated into Slavonic, into Armenian by the Dominicans, and into Chinese by the Jesuits, but of these the Chinese has never come into use, and the Armenian is extinct.

(b) The Ambrosian liturgy is that of the ecclesiastical province of Milan. Its main interest for scholars lies in the fact that it is a development, parallel to, but independent of, the present Roman liturgy, from some earlier form of the latter, which has been the common parent of both, and that it preserves some features of this parent which have been lost or much obscured in the Roman use.

(B) The origin of the Ephesian or Ephesine family of liturgies is traditionally ascribed to St John. Its distinctive feature is that the great intercession does not form part of the thanksgiving, as directed by the apostle Paul, but is placed after the close of the offertory, and immediately followed by the Pax, before the thanksgiving begins. It is almost extinct, but was once represented by at least three branches, of which one only survives. (a) The Mozarabic liturgy is the ancient liturgy of Spain, and owes its present name to the fact that those who continued to practise it had lived mixed with the Arab population. It would have died out altogether had not the celebrated Cardinal Ximenes established a special chapter to celebrate it in the cathedral of Toledo, and sanctioned it for the holders of a few isolated benefices, so that the practice of this liturgy is now confined to a side-chapel in the cathedral of Toledo, and the use of a few individuals. It is written in a very peculiar dialect of degraded Latin, and the existing texts are corrupt, some portions having been avowedly added by Cardinal Ximenes, under whose care all the service-books of this rite were edited.

(b) The Gallican or ancient liturgy of Gaul is totally extinct. No copy of it is known to exist, and the attempt to reconstruct it from fragments and incidental notices has largely exercised the industry and ingenuity of the learned. (c) The Celtic liturgy, as imported by Patrick into Ireland and by Columba into Scotland, was undoubtedly Gallican in form. Gillis the Wise introduced the Roman liturgy in the 7th century, and it gradually took the place of the other, which was finally stamped out in Scotland by St Margaret, and soon afterwards in Ireland, where it lingered a little longer. Its remains are more scanty than those of the Gallican. What liturgy was used by the early British (i.e. Cymric) Christians is unknown. It may have been either Roman, Gallican, or both. There is even a mention of a Greek liturgy in Wales. In the three Eastern families the bread (except among the Armenians) is always leavened. They are celebrated as a rule in the classical literary tongue of their respective countries. With regard to them it has to be observed that, while the majority of the Christians who use them belong to the Orthodox (vulgarly called the Greek), the Nestorian, or the Monophysite communions, there is everywhere a minority who adhere to the communion of Rome, and that, while employing, with only very slight differences, the same liturgies, there is between them a very grave doctrinal difference as to the consecration which cannot be ignored by the liturgical scholar. In each of these families the place of the prayer which follows the remembrance of the life of Christ in the Roman liturgy is occupied by a form invoking the Holy Ghost to descend upon the elements that they may be the body and blood of Christ. The Catholics maintain that the consecration is effected solely by the words of Christ, and that this prayer is therefore to be understood in

the same sense as in the corresponding one in the Roman liturgy—viz. as merely asking that the sacrament may be blessed to the receivers, and that the Holy Ghost is invoked to descend upon it in order to enable the communicants to 'discern the Lord's body' (1 Cor. xi. 29), in a manner somewhat similar to that in which He descended upon Christ's natural body at the time of His baptism, in preparation for the work of His ministry. On the contrary, the bulk at least of the Easterns outside the communion of Rome maintain that this invocation is essential (if not indeed the sole essential) to the consecration, which is not effected, or at least completed, until it has been uttered. It may be added that the Eastern Catholic clergy are in the habit of saying low masses without music and generally without incense, and that their celebrations are as frequent as those of Latins; while among the Orthodox and Monophysites there is a daily celebration in monasteries and cathedrals, but in ordinary churches only on Sundays, holy days, and special occasions; and among the Nestorians, although the celebration is nominally prescribed for all Sundays, Fridays, and holy days, it is not uncommon to find only a sort of Mass of the Catechumens performed even upon many Sundays.

(C) The origin of the Hierosolymitan or Jerusalem family of liturgies is ascribed to the apostle James. Its distinctive feature is that the great intercession occurs just before the closing doxology of the thanksgiving. (a) The earliest existing form is a liturgy in Greek, called by the name of the apostle, which is now obsolete everywhere, though it is said to have long lingered on in some of the Greek islands, for St James's Day only. However ancient may be some portions of it, especially in the thanksgiving, it contains in its present form comparatively recent features, the dates of which are known. (b) The Constantinopolitan. There is a liturgy (originating from the Church of Caesarea) called by the name of St Basil, abridged from that of St James, and of which the inaudible parts of the anaphora have again been abridged, under the name of St John Chrysostom, although it is very uncertain how far Basil and Chrysostom are really to be credited with the work. These liturgies, or rather this liturgy (since the differences are only in the inaudible part), is the only one in use in the Orthodox communion, and is celebrated in Greek, Arabic, Slavonic, and Georgian. A stranger entering a Greek church is liable to be struck, if not confused, by the way in which the actual liturgy, mostly inaudible, is overlaid with litanies and hymns of varying length, and still more by the almost entire concealment of the altar behind the screen called the *ikonostasion* ('image-stand'). (c) The Greek rite in Italy. A good many Italians, especially in the south, belong to the Greek rite. They now use the Constantinopolitan liturgy. There was once, however, a native Sicilian Greek liturgy, of which a text has been published by Assemani, and of which certain peculiar local practices are probably survivals. The members of the Basilian order in Italy had also a peculiar form of Greek liturgy, which may now be regarded as extinct, as the present government has suppressed all their monasteries, and the surviving members have mostly if not universally adopted the pure Constantinopolitan. Their liturgy was generally regarded as the Constantinopolitan affected by Westernisms, but this point has not been sufficiently investigated. (d) The Armenian liturgy is an adapted translation of the Greek St Basil. The language is Armenian. There is no *ikonostasion*, but a veil is sometimes drawn round the altar. The celebration of this rite is far more pompous and spectacular than that of any other used among Christians. (e) The Syriac liturgy of St James appears to be a free translation from an

early form of the Greek. Devout Syrian ecclesiastics seem to have had a sort of passion for composing paraphrases of the inaudible parts of the anaphora, and there exist at least some forty such compositions, sometimes dignified by the name of liturgies. This liturgy of St James is that used by the section of the native Christians of India ('Christians of St Thomas') who have abandoned the communion of Rome and their own ancient Babylonian rite, and embraced Monophysitism.

(f) The Constantinopolitan rite has had a great effect upon the forms of the Alexandrian or Egyptian liturgy, which is treated below under E.

(D) The origin of the Babylonian school of the liturgy, otherwise called the Assyrian or Chaldean, is ascribed to the apostle Thaddæus. The language is Syriac. The distinctive feature is that the great intercession occurs after the remembrance of the life of Christ and before the invocation, which immediately precedes the closing doxology of the thanksgiving. The oldest existing form is that of the liturgy called 'of the Apostles,' and is certainly of profound antiquity. There are two paraphrases of the anaphora of this liturgy, one of which is called the liturgy of Theodore of Mopsuestia; the other is named by the Nestorians in honour of the founder of their sect, but they appear to be as a whole older than the time of these persons. In the churches of this rite the sanctuary is a separate room, somewhat after the manner of the Holy of Holies of the Jewish temple, and the whole ceremony is of severe simplicity. The liturgy of Malabar, or original liturgy of the native Christians of India ('Christians of St Thomas'), is a form of the Babylonian liturgy of the Apostles, but is said to have suffered much ignorant meddling, under the influence of the Portuguese, at the synod of Diamper (1599).

(E) The Alexandrian liturgical family represents the form of the liturgy belonging to the Church of Egypt, and its origin is ascribed to the evangelist Mark. The properly distinctive feature is that the great intercession occurs between the *Sacrum corda* and the *Sanctus*—viz. in that part of the thanksgiving called the preface. Its existing monuments have all been corrupted by divers external influences, and their history is very obscure. (a) The normal or original form is called the liturgy of St Mark, and is in Greek. Like that of St James, it contains passages, especially in the thanksgiving, of which it would be rash to measure the antiquity, but, as we now have it, it has undoubtedly been modified under Constantinopolitan influences, and probably since the triumph of Monophysitism in Egypt. It continued to be used for many centuries by the Orthodox, but is now extinct, as they have adopted the full rites of Constantinople. (b) Renaudot has published what he believed to be an Alexandrian edition of the Constantinopolitan liturgy of St Basil. (c) At what period the Coptic or native language was substituted for the Greek is uncertain, and the present writer is inclined to the belief that it was a device of the Monophysites to popularise their heresy and emphasise their separation from the Orthodox. But whoever the translators may have been, they were confronted by the fact that the population were to a great extent bilingual; many formulae were familiar in Greek, and the theological terminology was mostly Greek. Accordingly the liturgy was translated into a sort of jargon of Coptic mixed with Greek words, many formulae were left in Greek, and the deacon was provided with a set of biddings in Greek so ample as nearly to amount to a translation of the prayers. The liturgy so produced was that which bears the name of St Cyril. It is a free translation and adaptation from that of St Mark, but from a recension earlier than that of which we possess any Greek text. It

is now almost extinct. (d) A fresh anaphora was composed, called by the name of St Basil, and in which the great intercession is transferred to the latter part of the thanksgiving, as in the Hierosolymitan family. It is now used only on some rare occasions. (e) A third anaphora was composed, called by the name of St Gregory, and this, joined to the pro-anaphora of St Cyril, constitutes the ordinary Coptic liturgy. A fresh linguistic difficulty has however arisen. Coptic is totally dead, and Arabic has become the language of Egypt. Hence the sermon is of course in Arabic, some parts of the liturgy are always, and the Creed and Lord's Prayer often, said in Arabic; each portion of Scripture is read in Arabic as well as Coptic, and Arabic hymns are introduced. The service is, in fact, trilingual. Coptic churches are generally very plain, the altar is surrounded by a wooden partition, and the ceremony is not showy. Incense is burned almost without ceasing from the beginning until the consecration. (f) The Abyssinian liturgy is in Ethiopic, and is called that of the Apostles. It is an adapted translation of the Coptic St Cyril. Here also there has been a considerable tendency to compose paraphrases of the anaphora, of which as many as ten are known to Western scholars.

It remains to mention a few externals which are common to all these families. All light wax tapers during the celebration, however bright may be the natural light (see LIGHTS), and incense (q.v.) is universally burned. Fans (q.v.) came into use in the southern countries where flies are troublesome, but as a rule they have now become mere ornaments carried in processions. As to vestments, the Chasuble (q.v.) is universally worn by the celebrant; nor is there any trace of a time when it was not. As, however, it is originally a mere round piece of stuff with a hole in the middle for the head, the hands can only be used while wearing it by raising it at the sides or in front. Hence in the Roman, Ephesian, and Babylonian families it is cut up at the sides and hangs down before and behind; among the Orthodox the front part below the breast is cut away; in the Alexandrian rite, and by the Armenians and some of the Syrians, it is entirely split up the front, and becomes a mere cloak. In all the families is also worn a long gown down to the feet, which is in English called an *Alb* (q.v.). This, with its accompanying girdle, of course represents the long tunic worn by orientals. The *stole* is a strip of stuff worn by the priest round his neck, and by the deacon over his left shoulder. It seems to be the *tallith* or religious garment of the Jews, which must of course have been worn in prayer by Christ and His earliest disciples, and which, as usually arranged, exactly resembles a stole. The *maniples* (in Greek, *epimanikia*) are cuffs seemingly used simply to confine the sleeves of the alb; the corresponding object worn by Latins, however, is put on the left arm only, and has a long flap; and some have maintained that it was originally a pocket-handkerchief. The *amice* is really a veil or covering for the head, and by the Copts it is so worn until the thanksgiving. In the other families it is generally pushed down upon the neck, and the Armenians, by embroidering it, have made it into a sort of ornamental collar.

The liturgies used by Protestants are either, as among Anglicans, adaptations of the Roman rite, or, as among Presbyterians, forms altogether newly invented, based upon Scripture and convenience only. The latter process has resulted in some interesting coincidences, such as the general introduction among Presbyterians of the ceremonial in bringing of the bread and wine at the offertory, called by the Greeks 'the Great Entrance;' while one school gained the popular name of 'Lifters,' from practising the Elevation. It may, however,

be remarked that Spanish Protestants have always shown a great leaning to the Mozarabic liturgy, the reason for which is plain enough, since it is not Roman, and is undoubtedly ancient and intensely national; and it is not improbably owing to the influence of Spanish refugees in London that in the second (and present) Anglican liturgy the great intercession (the 'Prayer for the Church Militant') has been placed in the offertory. The liturgy used by the body commonly known as Irvingites is remarkable for its literary merit.

Liturgical literature is exceedingly voluminous. For a single volume the reader may be referred to the Rev. C. E. Hammond's *Liturgies Eastern and Western* (Oxf. Clai. Press, 1878). Much matter will be found in the late Dr Neale's *Introduction to the History of the Holy Eastern Church*. As regards the Roman and Constantinopolitan rites, books are plentiful; as to the Armenians, the *Armenian Church*, by the Rev. E. F. K. Fortescue; for the Indian Monophysites, *The Christians of St Thomas and their Liturgies*, by the Rev. G. B. Howard; for the Nestorians and Chaldeans, *The Nestorians and their Rituals*, by the late Dr Badger; and for the Copts, *The Coptic Sunday Morning Service*, by the present writer, will supply information of a practical kind; while for other or more recent studies recourse may be had to the authors cited by Mr Hammond. The doctrine of the eucharist, and its history before and after the Reformation, is treated in the articles LORD'S SUPPER, PRAYER-BOOK; see also SACRAMENT, TRANSUBSTANTIATION.

Liutprand, or LUTFRAND, an author to whom we owe much of our knowledge of the history of the 10th century, was born of a distinguished Lombard family in Italy about the year 922. He entered the service of Berengar, king of Italy; but, having fallen into disgrace, he repaired to Germany, and served the Emperor Otto I., with whom he returned to Italy in 961. Otto made him Bishop of Cremona, and afterwards sent him on an embassy to Constantinople. He died about 972. His *Antipapalis* treats of the period from 886 to 959. He wrote also *De Rebus Gestis Ottobonis Imperatoris*, covering the years 960 to 964, and *De Legatione Constantinopolitana*, a satire on the Greek court. The best edition of his works is printed in *Bertz's Monumenta Germaniæ*, vol. iii. See Köpke, *De Vita Liutprandi* (1842).

Livadia (anc. *Isobadina*), a town of Greece, 60 miles NW. of Athens, destroyed by earthquake in 1894. Pop. 5000. From it the northern part of modern Greece used to be called Livadia.

Livadia, the name of an estate, with a couple of palaces and magnificent gardens and vineyards, belonging to the empress of Russia, situated on the south coast of the Crimea, 30 miles SE. from Sebastopol. The entire neighbourhood is sprinkled with the castles and villas of Russian nobilities, who come here for sea-bathing in the autumn.

Liver. The liver is the largest gland in the body. It weighs from 3 to 4 lb., and measures about 12 inches from side to side, and 6 or 7 inches from its anterior to its posterior border. It is situated in the right hypochondriac region, and reaches over to the left; being thick behind, convex on its upper surface, where it lies in the concavity of the diaphragm, and concave below, where it rests against the stomach, colon, and right kidney. This lower surface presents a fissure dividing the organ into a right and a left lobe. The liver is retained in its position by five ligaments. Besides the right and left lobes, there are three smaller lobes. The great bulk of the organ is, however, made up of the right lobe, which is six times as large as the left. The vessels of the liver are the hepatic artery, which comes off from the cardiac axis, and supplies the organ with nutrient blood; the portal vein, which conveys to the liver the venous blood of the intestines, spleen, and stomach,

and from which (after the vessel has ramified like an artery) the hepatic veins arise and convey the blood from the liver into the inferior vena cava.

In fact, the liver is a great glandular mass placed in the path of the veins passing from the stomach

and intestines towards the heart. The blood, laden with nutritious matter, has to pass through the liver before it can get into the general circulation; in its passage it comes into intimate relationship with the minute hepatic cells, which alter its constitution, abstracting or adding various constituents. The bile is one of the products of the liver cells, which, obtaining their raw material from the blood, secrete this fluid into tiny ducts (drains). These join with other vessels to form larger and larger ducts (just as veins join with other veins to form larger vessels), which finally leave the liver and pass towards the gall-bladder. Here the Bile (q.v.), which is constantly secreted, is stored up ready to be discharged into the intestine during digestion. The bile, which is of a brown, or in some animals, of a green colour, is coloured by pigments (bilirubin, biliverdin), which are undoubtedly decomposition products of hæmoglobin, the colouring matter of the blood. It appears, therefore, that the red corpuscles of the blood which contain this pigment are continually suffering dissolution, probably the old and useless cells being destroyed within the body by the agency of other cells. Whether their destruction actually takes place within the liver is not yet absolutely certain, but it is certain that the liver removes their colouring matter from the system. Occasionally it happens that the liver may have a heavier task thrown upon it than it can undertake. Thus, a rapid dissolution of corpuscles may take place from various conditions; for instance, there may be an excess of blood after a bloodless amputation, where the blood of a limb before the operation has been driven into the rest of the body; or, again, when the blood from the after birth has been allowed to flow into the body of a baby. In these cases the liver may be unable to excrete all the pigment and

c, intestines; p, portal vein breaking up into capillaries among liver cells (c); blood subsequently passes to heart (h).

jaundice will arise. A similar condition will follow any obstruction to the outflow of bile from the liver (gall-stone, inflammation of ducts, &c.). The already secreted bile will in that case pass back into the system through the absorbent lymphatics. In the bile are certain organic salts, taurocholate and glycocholate of sodium. It is probable that these result from the destruction of albumen, perhaps that of the red blood-corpuscles. Of these salts and their rôle in the economy there is much to be learned; they are probably in part reabsorbed from the intestine into the blood.

These functions of the liver commence at an early period of intra-uterine life, the excreted bile accumulating in the intestine, and forming the greenish substance, meconium. After birth the bile may be looked upon not only as an excretion from the body, but as performing in its outward passage through the intestine the part of an aid to digestion and absorption (see BILE, DIGESTION).

But the liver has other and perhaps equally important functions to perform. It is a great store-house of food material. When the body is well nourished the liver cells store a certain quantity of fat, which they can part with during starvation. In stall-fed animals, beer-drinkers, &c. the liver is loaded with fat, while the liver (*pâté de foie gras*) of the Strasburg goose is a mass of fat, with hardly any vestige of the original tissue left.

Claude Bernard was the discoverer of one of the greatest functions of the liver. It appears that carbohydrates and proteids absorbed in a soluble form into the blood are, for the most part, seized by the liver and prevented from entering the general circulation. The liver retains them chiefly in the form of glycogen or animal starch, $C_{12}H_{20}O_{10}H_2O$; and after a good meal as much as 5 per cent. of the organ may consist of it alone. This glycogen is then discharged from the liver, probably in the form of a soluble sugar, as the economy is in need of it. We have here a wonderful provision for regulating the food supply to the tissues, for it would be of obvious disadvantage to them were they inundated with pabulum directly after each meal, and then left without any at all. Many parts of the body, the muscles for instance, are capable of storing glycogen on their own account; but this power is limited, and the great glycogen storehouse is the liver.

We have already seen that there is evidence that proteid substances are broken down in the liver. The greater part of the nitrogen of the proteid is excreted by the kidneys in the form of urea, which substance, as has experimentally been shown, has its primary origin in the liver itself. If carbonate of ammonia be injected through the organ it is converted into urea, which appears in increased quantity in the blood, and is excreted by the kidneys. After a highly nitrogenous diet urea in like manner appears in the blood, the nitrogen having separated from the proteid molecule. In birds and reptiles, where the nitrogen waste of the body is uric acid, not urea, the former substance is also formed by the liver, extirpation of the organ causing a marked diminution in the uric acid formation.

DISEASES OF THE LIVER.—The liver, like other organs of the body, is subject to disorder and disease. It is subject to congestion from exposure to cold, and it is certain to suffer from any prolonged violation of the laws of dietetics. The European living in India who persists in the food habits of a cold climate, although he lives in a warm one, is certain to develop a 'liver.' The beer drinker acquires a fatty liver, and the drunkard an organ in which the cellular elements have greatly diminished, the mass of the organ becoming mere fibrous tissue. The most important,

because the commonest, malady connected with disorder of the liver is that known as *biliousness*. The acute form, or 'bilious attack,' has been shortly noticed under Bile (q.v.); but many persons suffer habitually or for long periods from an allied condition. The symptoms are very various; but the most common are dull pain with a feeling of weight in the region of the liver, and pain in the right shoulder, usually worst after meals; a bitter taste in the mouth, with coated, yellowish tongue, dull headache, giddiness; sometimes drowsiness, sometimes sleeplessness; and generally more or less depression of spirits. The condition is most apt to occur in those who take too much or too rich food or drink, with too little exercise. It is probably caused not merely by deficient secretion of bile, but by imperfect performance of the other functions of the liver, especially the disintegration of albuminoid bodies. For the removal of the condition the most important measure is proper regulation of the patient's habits. Great care in diet must be enjoined, particularly as regards alcoholic drinks. Of these malt liquors and sweet or strong wines are the most injurious; but it is generally best to abstain from them altogether. Rich dishes must be avoided, and sugar and meat be taken in moderate amount. Exercise in the open air is very important; riding is the most, walking probably about the least, useful form. With regard to drugs, mercurials (e.g. blue pill) often give great relief; but their habitual use is dangerous. A daily draught in the morning of some saline aperient is generally desirable; and nitro-hydrochloric acid in small doses, with some bitter tonic, is often very useful. Biliousness seldom seriously shortens life, but it often grievously interferes with its enjoyment, and with the power of doing work with any vigour or satisfaction.

Congestion of the liver occurs in at least some cases of biliousness, and in inflammation of the organ; but also in consequence of disease of the heart or lungs causing interference with the return of blood through it. In long-standing cases of this disease the substance of the liver presents a peculiar mottled appearance, whence it is called *nutmeg liver*.—*Gall-stones* (see CALCULUS) and *Jaundice* (q.v.) have already been considered.

Acute inflammation (hepatitis) and *abscess* may occur in the course of other diseases, especially pyæmia; but in their most characteristic form they are much more common in hot countries, and in a large proportion of the cases accompany or follow dysentery. The symptoms are extremely variable; there may be fever, pain, or weight in the liver and right shoulder, and disturbance of digestion; but in some cases all these are absent. If the abscess be in the anterior part of the liver, its presence may be indicated by bulging, or enlargement with alteration of shape of the organ; but if deeply seated no indication of its presence may be found.

Treatment.—In the early stages the disease sometimes seems to be checked by the administration of large doses of ipecacuanha and the application of poultices or hot fomentations; and even when an abscess is present it may subside spontaneously, or may discharge through lung, stomach, bowels, or skin with a favourable result. Such cases, however, are exceptional; and the introduction of the aspirator and of antiseptic methods has shown that surgical interference in such cases need not be dreaded as it once was. Evacuation and opening of liver abscesses have in fact in recent years saved many lives that would otherwise in all probability have been sacrificed.

Acute yellow atrophy of the liver is a curious and happily rare disease, chiefly affecting young women, in which rapid and intense jaundice, attended by

severe nervous symptoms (headache, delirium, coma, &c.), but without fever, almost invariably leads to a fatal issue in a few days. After death the liver is found much diminished in size; and its secreting cells are reduced to a mass of oily debris. The symptoms much resemble those of phosphorus poisoning; but the causes of the disease are as yet obscure.

Cirrhosis of the liver, or interstitial hepatitis (Gr. *kirrhos*, 'yellowish'), begins as an inflammatory affection, in which lymph (see INFLAMMATION) is effused in the areolar tissue surrounding the branches of the portal vein. The smaller branches become obliterated by the pressure, and, as the lymph subsequently contracts, larger branches of the veins and ducts become strangulated, and the surface of the organ assumes the uneven or bossed appearance known as *lobulated*. In this affection the liver is probably at first somewhat enlarged, and occasionally remains so, but in general as the contraction of the effusion goes on it at length becomes considerably smaller than the natural size. The ordinary cause of this disease is spirit-drinking, and it is popularly known as the *gin-drinker's liver*. The obstruction to the portal circulation occasions the effusion of serum into the peritoneal cavity; and this effusion often goes on so rapidly as soon to force up the diaphragm and impede respiration. The lower extremities may become anasarous, but the arms and face are never affected. The portal obstruction often also gives rise to hemorrhage from the bowels or stomach. In a fully developed case of cirrhosis the liver is so altered in structure that palliative treatment is all that can be attempted. This must be directed to the relief of the dropsy, and, if medicines fail to remove or diminish it, temporary relief may be obtained by tapping; but the disease is a very hopeless one.

Amongst the other affections of this organ are the *fatty liver*. The liver in this case is much enlarged, of a pale colour, and rounded at the edges; the disease is most commonly found associated with phthisis and in cases of general obesity. Closely allied to this is the *lardaceous* or *waxy liver* (see WAXY DISEASE). Tubercle, syphilitic disease, and different forms of cancer, generally secondary to cancer elsewhere, are not unfrequently found in this organ. It is also much the most frequent seat of Hydatids (q.v.).

Liverpool, situated on the north bank of the Mersey, in Lancashire, is—if we include Birkenhead, on the opposite side of the river—the second largest town in the United Kingdom. A port not only for the adjacent manufacturing districts, but for the commerce with America, it ranks in maritime importance before the metropolis itself—a circumstance due to its position on the west coast of England. It is situated at three-quarters of an hour's distance by railway from Manchester (31 miles), four and a quarter hours from London (291 miles), six hours from Edinburgh (220 miles), and seven hours by rail and steamer from Dublin. The rise of Liverpool is remarkable. In the middle of the 14th century it contained only 840 inhabitants and 168 cottages; whilst in 1561 its population was only 690. This decadence accounts for the circumstance that though the town was represented in parliament in 1296 and 1306, there were no members summoned between the last named date and 1547. It is interesting to note here that Francis Bacon (afterwards Lord Chancellor) was M.P. for Liverpool in the years 1588-92. It was not until 1647 that Liverpool was made a free port (having been subject down to that date to the Chester officers); and it was not erected into a separate parish until 1697, when its population numbered about 5000 souls, and its shipping about 80 vessels. Between

1710 and 1760 its population increased from 8160 to 25,780, and its commercial navy from 84 vessels to 1245. In 1700 its first regular dock was built on the site where the custom-house stands at the present day. From 1760 to 1800 the population advanced from 25,700 to 77,700 inhabitants, the shipping from 1200 vessels to 5000, and the amount of dock-dues collected from £2300 to £28,300, nearly two-thirds of the increase taking place during the last fifteen years of the period. The chief cause of this extraordinary progress was the rapid growth of the cotton industry; the consumption of raw cotton having risen from 5,000,000 lb. in 1781 to 48,000,000 lb. in 1801; while the official value of cotton products exported had, in the meantime, increased from £355,000 to £7,051,000. Simultaneously with the mechanical revolution brought about by Hargreaves, Arkwright, Crompton, and others, there came an increased foreign trade, and an augmented inland business, owing to the opening of the Bridgewater (q.v.) Canal in 1771. About the same period, too, a great start was given to the shipbuilding trade of the port by several extensive orders received from government; some 15 vessels of war being launched between 1777 and 1782, of very considerable tonnage, and ranging between 16 and 50 guns. Liverpool as the leading port connected with the African trade, almost monopolised the traffic in slaves between Africa and the West Indies, &c. As late as 1807 her shipowners had 185 vessels engaged in the business, capable of carrying about 44,000 slaves. By the close of the last century Liverpool had far outstripped Bristol in commercial importance.

But great as was the progress made during the closing twenty years of the 18th century, it was far exceeded in the 19th; in 1881 the population within the municipal boundary was 552,508, and within the parliamentary boundary 601,950. In the next decade there was however an apparent decrease, the population of the city at the census of 1891, after some readjustment of areas, was 517,951, and of the parliamentary borough, 584,471. Adding to this the population of Birkenhead (q.v.), on the opposite side of the river, we get 684,328; so that, with other adjoining places, the total population of what may be termed the port of Liverpool is about 700,000. A very large number of merchants, brokers, tradesmen, clerks, and working-men, whose daily occupations are in Liverpool, have their residences on the Cheshire side of the river. The passenger traffic between the two sides of the river averages 60,000 per day, of which 44,000 are by the various ferries and 25,000 through the Mersey railway tunnel. The progress in population and tonnage compares as follows:

	Population			Shipping, Tons.	Dock Dues, £.
	Liverpool, No.	Birkenhead, No.	Total		
1781	30,000	1,500	40,500	200,000	5,000
1801	85,500	3,100	88,600	450,700	28,200
1821	144,700	4,700	149,400	830,800	94,500
1841	311,700	21,000	332,700	2,425,100	175,500
1861	477,000	73,000	550,000	4,897,200	144,400
1881	686,400	103,100	789,500	7,893,000	705,000
1891	517,951	170,000	687,951	9,775,500	1,117,900

The figures include the suburbs of both places. Of the entire population it is estimated that 150,000 are Irish and about the same number Welsh.

The effect of the Manchester Ship Canal on the trade of Liverpool has not been so injurious as was at one time expected. It does not follow that what Manchester secures Liverpool loses; and the more economical management of the Dock Estate, and the reduced railway charges which the competition of the canal enforces, may in the long run actually bring more business to Liverpool.

In 1891 the total tonnage of ships that entered and cleared at Liverpool (excluding coastwise sail

ings) was 10,489,578, as compared with 14,433,580 at London, and 10,478,391 at Cardiff. The imports of colonial and foreign merchandise at Liverpool show a value of £95,630,489; the exports of home produce to foreign ports, £78,089,359, and of foreign and colonial produce, £1,254,037. The whole foreign trade of Liverpool in 1895 was £186,259,875, as compared with a total at London of £224,718,326; all other ports dividing amongst them the remaining 40 per cent. of the trade of the whole country. Liverpool accounts for about one-fifth of the British tonnage, one-tenth of the foreign, and one-sixth of the total, and only falls behind London in respect of the foreign. Liverpool figures for one-fourth of the imports, more than two-fifths of the exports, and nearly one-third of the entire foreign trade of the United Kingdom. Of 115 million cwt. of bread-stuffs imported, 28 million came through Liverpool; as did also 3½ million out of 6 million cwt. of bacon, hams, beef, pork, and lard; 3 million out of 6 million cwt. of rice; 6½ million out of 17½ million cwt. of unrefined sugar; and 23 million out of 46 million lb. tobacco. Liverpool shipped £46,342,000 out of £71,986,000 worth of cotton products exported; £9,232,000 out of £25,006,000 worth of woollens; £2,942,000 out of £5,552,000 worth of linens; £11,705,000 out of £30,866,000 worth of metals; £4,502,000 out of £12,939,000 worth of machinery; and £1,489,000 out of £3,168,000 worth of hardware and cutlery.

This gigantic trade has given rise to the magnificent system of docks extending along the margin of the river for a distance of nearly 6½ miles, containing 25 miles of quay-space and 380 acres of water-space, besides 9 miles of quay-space and 164 acres of water-space at Birkenhead, making a total of 34 miles and 544 acres respectively. There are also 17 acres of water-space in the docks worked by the various canal companies, and there are besides 14,920 feet of graving-docks, of which 2430 feet are in Birkenhead. The total area of the Dock Estate is 1083 acres in Liverpool and 506 acres in Birkenhead. The whole of the docks (except the Salthouse, King's, and part of the George's and Queen's) have been built since 1812, and are regarded as amongst the greatest engineering triumphs of the 19th century. Several of the docks are enclosed with large warehouses: the erection of those round the Albert Dock cost £358,000. The dock itself cost £141,000. The warehouses round the Waterloo Dock contain large grain-elevators, which are a wonder in themselves. For the accommodation of the river traffic (passenger, goods, and mails) there is a floating landing stage, 2063 feet long and 80 feet wide, with seven large bridges connecting it with the shore; also a floating bridge, 550 feet long and 35 feet wide, by means of which an easy incline for carriage traffic is maintained at all stages of the tide. The steamer traffic, conducted by regular liners with every port of importance in the world, draws large numbers of emigrant and other passengers to the town. The total amount of capital invested in the Dock Estate is £17,088,683. See the article Dock.

Of the seven railways in direct connection with the city, the North Western, Lancashire and Yorkshire, and Midland have handsome passenger stations, and numerous goods stations are spread over the town and on the line of docks. There are five tunnels under the town. The Mersey railway tunnel, 1230 yards long, connecting Liverpool with Birkenhead, was begun in 1881, and opened by the Prince of Wales in 1886. The capital invested in the Mersey Railway amounts to £2,224,000. Number of passengers in 1890, 9,318,235. Prior to 1857 the water-supply of the town was derived

chiefly from the works at Bootle and Harrington. In 1850 steps were taken to erect the works at Revington (near Bolton), which were opened in 1857. In 1881 the foundation of new water-works was laid at Lake Vyrnwy, about 25 miles from Oswestry and 45 miles in a straight line from Liverpool. Liverpool has several extensive ship-building yards, iron and brass foundries, chain-cable and anchor smithies, engine works, tar and turpentine distilleries, rice and flour mills, tobacco, cigar, and soap manufactories, breweries, sugar-refineries, roperies, glass-works, chronometer and watch manufactories.

The architecture of the town has been greatly improved in the latter half of the 19th century, and it now possesses many fine thoroughfares, thronged with numerous splendid edifices. The domed Town-hall, in the Corinthian style, was originally built in 1754, but has since been considerably enlarged. St George's Hall is a grand building in the Greco-Roman style, nearly 500 feet long, built between 1838 and 1854. It comprises the assize court, a great hall 169 feet in length, 87 feet in width, and 74 to 82 feet high; and a smaller concert-room. The organ in the great hall cost £10,000, and the entire building £330,000. Municipal Offices, Custom-house, Sailors' Home, Police-courts, Workhouses, Baths and Wash-houses, Water-works, and Gas-offices are also noteworthy. The Free Library and Museum, opened in 1860, and presented to the town by Sir William Brown, cost £40,000; with it are incorporated the Museum of Natural History presented by the thirteenth Earl of Derby, and the Museum of Antiquities presented by Mr Mayer. Other institutions are the Walker Art Gallery, presented by Sir A. B. Walker, Bart., at a cost of £35,000; the Pieton Reading-room, erected by the corporation at a cost of £25,000; the Botanic Gardens, Observatory, the Liverpool College, Liverpool Institute, Queen's College, Medical Institute, Royal Institution, the various schools attached to the national and other churches, Academy of Fine Arts, the Exchange, Lyceum, and Athenæum, news rooms and libraries, and numerous associations devoted to commercial, political, philosophical, scientific, and religious affairs. University College, on the model of Owens College, was inaugurated in 1882; the endowment is over £125,000. The college, affiliated to the Victoria University, Manchester (see OWENS COLLEGE), had, in 1890, sixteen professors and lecturers in the literature and science department, and fourteen chairs in the medical department. There are about one hundred charitable institutions in the city. There are some 270 churches and chapels, of which 92 belong to the Established Church, 29 to Roman Catholics, 25 to Welsh Nonconformists, 24 to Presbyterians, 21 to Wesleyans, 18 to Methodists, 17 to Baptists, 14 to Independents, and 30 to various bodies, including 6 Unitarian chapels, 3 synagogues, a Friends' meeting-house, and a Greek church. The see of Liverpool was created in 1880, with an endowment of £100,000, raised by public subscription. There are seven cemeteries, only one of which is situated within the city.

The buildings devoted to commercial pursuits are also very fine and numerous. Amongst them are the Exchange, Liverpool and London Insurance Chambers, Royal Insurance, and Queen Insurance buildings (all local companies), and many others. The Exchange was originally built in 1803 S, but was rebuilt and enlarged in 1864-67. The cost of the new building, which stands upon about two acres of ground, was about £600,000. The general merchants and brokers, shipowners and brokers, metal merchants and brokers, wool brokers, leather brokers, &c. meet daily in the

news-room—175 feet long, 90 feet wide, and 50 feet high. The cotton merchants and brokers meet (according to the custom of nearly a century) in the open air, in the spacious area or 'flags.' The style of the building is French Renaissance. Of clubs there are the Reform, Junior Reform, Conservative, Palatine, Exchange, &c. There are fourteen banks in the town, and several of them are possessed of very large and handsome business premises. Amongst these may be named the branch of the Bank of England, and the Liverpool, Union, North-Western, Parr's, District, Commercial, National Provincial, and North and South Wales banks. Of monuments the chief are those of the Queen, Prince Albert, William IV., Nelson, Wellington, Huskisson, and Beaconsfield, besides several in the Town-hall, St George's Hall, Free Library, and parks. The parks are eight in number—the Stanley, Sefton, Prince's, Botanic, Kensington, Newsham, Sheil, and Wavertree.

The market-days are Wednesday and Saturday, for general agricultural produce, and Tuesday and Friday for corn. The fairs for horses and cattle are held July 25th and November 11th. The corn trade transacts its business in the Corn Exchange, Brunswick Street, and there is an extensive market for the cattle-dealers in Kensington. For agricultural produce there is the Northern Hay Market. For edibles of all kinds there are St John's, and St James's, Gill Street, and St Martin's markets. There are six daily (four morning and two evening) and four weekly newspapers, besides the *Daily Telegraph* and *Bill of Entry*, exclusively devoted to shipping matters, three weekly literary periodicals, and one scientific monthly magazine. Since 1885 Liverpool returns nine members to parliament.

The name *Liverpool* first occurs in a deed of 1190: the etymology is not improbably the *Cymric Llyrpool*, 'the expanse at the pool,' or 'the pool at the confluence.' The Derby (Stanley) and Sefton (Molynex) families, whose mansions are only a short distance from the town, have from the earliest times been intimately connected with the borough and city. Several members of both families served the office of mayor in the 16th, 17th, and 18th centuries. Amongst other worthies, natives of the town, may be mentioned Jeremiah Horrocks, the eminent astronomer; George Stubbs, eminent as an animal painter; John Deare, sculptor; John Sadler, inventor of painting on pottery; Peter Letherland, inventor of the patent lever watch; Mis Hemans, the poetess; Benjamin Spence, sculptor; and William Roscoe, poet, historian, and banker. Other 'Liverpudlians' of eminence in various departments of life were Viscount Cardwell, Bishop Lightfoot, General Earle, Mr Gladstone, Sir James Pictou, A. H. Clough, Meadows Taylor, the actor Sothorn, Ansdell, Gunter, Waterhouse, A. W. Hunt, Walter Crane, W. S. Jevons, and the new 'Liverpool school'—a term held to comprise J. A. Noble, William Watson, Hall Caine, R. Le Gallienne, and others.

See Baines, *History of the Commerce and Town of Liverpool* (1852); Pictou, *Memorial of Liverpool* (2 vols. 1874; 2d ed. 1876); and *The Cotton Trade of Great Britain, with a History of the Liverpool Cotton Market*, by the writer of the present article (1886).

Liverpool. ROBERT BANKS JENKINSON, EARL OF, statesman, was born 7th June 1770, the son of the first Earl (1727-1808). He was educated at the Charterhouse and Christ Church, Oxford, and entered parliament in 1791 as member for Rye. Like his father he was a Tory, but with Liberal ideas on trade and finance. In 1794 he became a member of the India Board, and in 1801 foreign secretary in the Addington ministry, when he

negotiated the unpopular treaty of Amiens. In 1803 he was created Lord Hawkesbury, and on Pitt's return to power he went to the Home Office, as it was thought desirable he should continue to lead the House of Lords. On the death of Pitt he was invited to form an administration, but declined in consequence of the schism in the Tory party. In 1807, however, he again took the Home Office, under the Duke of Portland, and next year succeeded his father as Earl of Liverpool. In Perceval's ministry of 1809 he was Secretary for War and the Colonies, and in this capacity was charged with pusillanimity in connection with the Peninsular war. After the assassination of Perceval in 1812 Lord Liverpool formed an administration which it was predicted would not last for six months, but which in fact existed for nearly fifteen years, and then fell only through the illness of the premier himself. The first ten years of the Liverpool ministry (1812-22) have been severely criticised. The partition of Saxony, the abandonment of Poland, the union of Holland and Belgium, the Austrian establishment in Italy, the alleged connivance of England in the suppression of the revolutionary agitation in Naples, the mismanagement of the finances, the increase in the duty on foreign corn, the coercive measures adopted for dealing with discontent in England, are all pointed to as so many proofs of the incapacity or despotic sympathies of the English government of this period. Lord Liverpool himself was a Free Trader, and regarded the Corn Law of 1815 as merely an experiment; and when he was joined by Huskisson and Canning he began to liberalise the tariff. He also desired to retain a portion of the property tax, which would have obviated the necessity for fresh taxes; and, as it only affected men with incomes of upwards of £200 per annum, its retention would have been a distinct boon to the working-classes. But Whigs and Tories alike opposed it. Notwithstanding the blunder of the sinking fund, Lord Liverpool's financial policy generally was of a sound and enlightened character; and his administration was an economical one. As a statesman, his chief title to remembrance lies in the fact that he united the old and the new Tories at a critical period, and in a manner which neither Canning nor Wellington could accomplish. On February 17, 1827, he was stricken with apoplexy, but he remained nominally prime-minister until April, when Canning formed a new government. He died 4th December 1828. See the Life by C. D. Yonge (3 vols. 1868).

Liver-rot. See FLUKE.

Liverworts (*Hepatica*) are green flowerless plants closely allied to mosses. They grow profusely on damp rocks, not infrequently on leaves and stems in moist tropical regions, and sometimes even in the water. The majority are prostrate creepers, but others raise themselves in upright leafy growths, intermediate between the wholly leaf-like Thallophytes (e.g. seaweeds) and the higher Cormophytes (e.g. fern) in which distinct stem structures are developed. There is a marked difference in structure between the upper and lower surfaces; thus, the former turned towards the light bears chimney-like openings (*stomatia*), while the under side next the substratum gives off attaching and absorbing micellular outgrowths (*rhizoids*) which are physiologically comparable to the roots of higher plants. If a young plant floating in water be illumined wholly from beneath, the rhizoids will develop on the upper surface, i.e. away from the light as usual. The growth is usually forked or dichotomous, and is often remarkably profuse by the moist river side or in the damp greenhouse. The plants die away behind

as they push ahead with fresh growth, and apart from this they multiply asexually by means of detachable clumps of cells (or *gemmae*), which are often formed in special cups on the upper surface.

Life-history of Livery (1. *Marchantia polymorpha*): 1 and 2, developing thallus; 2 shows the cup with gemmae; 3, section of a cross thallus, showing chimney-shaped stomata and reproductive cells under, and nomenclature cell on left; 4, male hats; 5, development of antheridia; 6, antheridium nearly ripe; 7, antheridium; 8, female hat; 9, 10, archegonia before fertilisation; 11, 12, 13, fertilised egg dividing; 14, immature sporogonium, containing spores and elaters.

Like the Hydra among animals, liverworts may be artificially propagated by being cut into fragments, and they have remarkable powers of surviving prolonged desiccation.

On the vegetative thallus male and female hats or reproductive organs are borne, on the same or on different plants, often with a quaint umbrella-like or mushroom-like form. From a female cell fertilised by an actively motile male element there arises a new spore-bearing generation, but this, as in mosses, remains connected with the sexual plant. Within the spore-cases of the spore-producing generation there are long spring-like cells (*elaters*), which twist and untwist as moisture is absorbed or given off, and in so doing help to scatter the ripe spores. From the latter the new liverworts are established, the life-history thus illustrating the usual alternation of generations between oophyte and sporophyte. The class Hepaticae includes five orders: (1) Jungermanniaceae—e.g. *Jungermannia* and *Pellia*; (2) Monocleaceae—e.g. *Monoclea*; (3) Anthocerotaceae—e.g. *Anthoceros*; (4) Ricciaceae—e.g. *Riccia* and *Riccia*—the latter remarkable for its submerged bat-crest thallus, which forms a continuous spiral round a central axis; (5) *Marchantia*—e.g. *Marchantia*, *Lunularia*, and *Fegatella*. The abundant *Marchantia polymorpha* is a convenient type for the practical study of the class. See Bennett and Murray, *Handbook of Cryptogamic Botany* (Lond., 1889).

Livery (through the French from Lat. *liberari*, 'to deliver'), a word derived from the custom which prevailed under the Merovingian and Carolingian kings of *delivering* splendid habits to the members of their households on great festivals. In the days of chivalry the wearing of livery was not as now confined to domestic servants. The duke's son, as page to the prince, wore the prince's livery, the earl's son bore the duke's colours and badge, the son of the esquire wore the livery of the knight, and the son of the gentleman that of the esquire. Cavaliers wore the livery of their mistresses. There was also a large class of armed retainers in livery attached to many of the more powerful nobles. The livery colours of a family are taken from their armorial bearings, being generally the tincture of the field and that of the principal charge, or the two tinctures of the field are taken instead where it has two. They are taken from the first quarter in case of a quartered

shield. These same colours are alternated in the 'wreath' on which the crest stands. The royal family of England have sometimes adopted colours varying from the tinctures of the arms. The Plantagenets had scarlet and white; the House of York, murrey and blue; white and blue were adopted by the House of Lancaster; white and green by the Tudors; yellow and red by the Stuarts, and by William III.; and scarlet and blue by the House of Hanover. An indispensable part of the livery in former times was the Badge (q.v.).

The freemen of the 75 city guilds or corporations which embrace the different trades of London are called liverymen, because entitled to wear the livery of their respective companies. In former times the wardens of the companies used yearly to deliver to the Lord Mayor certain sums, twenty shillings of which was given to individuals who petitioned for the money to enable them to procure sufficient cloth for a suit, and the companies prided themselves on the splendid appearance which their liveries made in the civic train. Till the Reform Bill in 1832, the liverymen had the exclusive privilege of voting for members of parliament for the City. The twelve chief corporations are the Mercers, Grocers, Drapers, Fishmongers, Goldsmiths, Skinners, Merchant Tailors, Haberdashers, Salters, Ironmongers, Vintners, and Clothworkers. A royal commission was appointed to inquire into the City companies in 1880, when their charitable or trust income was returned at £200,000 a year, their corporate income at upwards of £550,000, and the capital value of their property (in the City, in the funds, in estates all over England and in Ulster) at £15,000,000. The annual cost of the hospitality exercised by the companies was estimated at £100,000; and of the 20,000 hereditary members about 12,000 were said to belong to the working-classes. The commission's gigantic Report was issued in 1884.

Livingston. See GUATEMALA.

Livingston, an eminent American family, descended lineally from the fifth Lord Livingston, the guardian of Mary Queen of Scots, and from his grandson, the Rev. John Livingston (1603-72), minister of Anerum in Teviotdale, who was banished for refusal to take the oath of allegiance to Charles II., and from 1663 was pastor of the Scots kirk at Rotterdam. His son Robert was born at Anerum in 1654, went to America in 1673, settled at Albany, and received a grant of a vast tract of land, which he had erected into the manor and lordship of Livingston. He died in 1725. One of his grandsons was Philip Livingston (1716-78), who sat in the first Continental congress, and was one of the signers of the Declaration of Independence. Another was William Livingston (1723-90), the 'Don Quixote of the Jerseys,' who was the first governor of New Jersey (1776-90), and conspicuous for the energy and ability of his administration. The most distinguished of the family, however, were the brothers Robert R. and Edward Livingston, great grandsons of the first Robert.

ROBERT R. LIVINGSTON was born in New York city, 27th November 1746, graduated at King's (now Columbia) College in 1765, and was admitted to the bar in 1773. Sent to congress in 1775, he was one of the five members of the committee charged with drawing up the Declaration of Independence. When the constitution of the state of New York was settled he was appointed chancellor, a dignity he retained till 1801. He was then sent to Paris as minister plenipotentiary, and successfully negotiated the cession of Louisiana to the United States. He enabled Fulton to construct his first steamer, and introduced in America the

use of sulphate of lime as a manure, and the merino sheep, and in many other ways distinguished himself as a national benefactor. He died on 26th February 1813. There is a biography by F. De Peyster (New York, 1876).

EDWARD LIVINGSTON, jurist and statesman, was born at Clermont, New York, 26th May 1761, and graduated at Princeton in 1781. He was called to the bar in 1785, and soon obtained an extensive practice. He had spent his youth among the founders of American independence, all of whom he had known as visitors of his father—a justice of the New York Supreme Court—and he at once attained a prominent position. He sat in congress from 1795 to 1801, when he became U.S. district attorney for New York, and mayor of New York city; but in 1803, owing to the misappropriations of a subordinate, he found himself considerably in debt to the federal government. He at once handed over his whole property to his creditors, threw up both his appointments, and resolved to quit New York. Louisiana had just been annexed to the United States through his brother's negotiations; and in 1804 he settled in New Orleans, where he at once obtained lucrative practice at the bar. During the second war with England he was aide-de-camp and secretary to General Jackson; and from 1822 to 1829 he represented New Orleans in congress. In 1823-24 Livingston was employed in reducing to system the civil code of Louisiana—for which task his wide acquaintance with jurisprudence rendered him peculiarly fitted. He was also commissioned to prepare a new criminal code, and in a preliminary treatise he laid down the principles on which he was to proceed. He proposed the abolition of the punishment of death, and a penitentiary system, which at once drew general attention to his labours. His book was reprinted in London, translated into French, and was very favourably received in England, France, and Germany. His code of crimes and punishments was completed, but not directly adopted. Livingston was elected in 1829 to the United States senate, and in 1831 appointed secretary of state. Two years later he went to France as minister plenipotentiary, and succeeded in securing payment of the indemnity on account of French spoliations. He died on 23d May 1836. See the Life by C. H. Hunt (New York, 1864).

Livingstone, DAVID, missionary and traveller, was born at Blantyre in Lanarkshire, 19th March 1813. His parents, who were in humble life, were of devout and exemplary character; his father in particular being a great reader, especially of travels and missionary intelligence, and much interested in the enterprise of the 19th century. At the age of ten David became a worker in a cotton-factory at Blantyre, and continued in that laborious occupation for fourteen years. His thirst for knowledge led him to read all that he could lay his hands on; he used also to attend a night class, after the long hours of the factory, for the study of Latin. The reading of Dick's *Philosophy of a Future State* was not only the means of a profound impression on his own mind, but kindled the desire to devote his life as a missionary to the service of Christ. Deeply impressed with the advantages of medical training to a missionary, he resolved to qualify himself in medicine, as well as the other attainments looked for in a missionary. The London Missionary Society having accepted the offer of his services, he went to London to complete his studies. His first desire was to labour in China, but, war having broken out between that country and Great Britain, this wish could not be fulfilled. The Rev. Robert Moffat's visit at this time to England turned many hearts to Africa—Livingstone's among the rest; ultimately he was

appointed to that field, and, having been ordained on 20th November 1819, he set sail for Africa, reaching Lattakoo or Kuruman, Moffat's settlement, on 31st July 1841.

For several years Livingstone laboured as a missionary in the Bechmana country, at Mabotse, Chomana, and Kolobong, places that were chosen by him just because they were in the heart of heathenism. The conversion of Sechele, chief of the Bakwains, and several of his tribe was a great encouragement. Repulsed by the Boers in an effort to plant native missionaries in the Transvaal, he directed his steps northward, discovered Lake Ngami, and found the country there traversed by fine rivers and inhabited by a dense population. His anxiety to benefit this region led finally to his undertaking to explore the whole country westwards to the Atlantic at St Paul de Loanda and eastward to the Indian Ocean at Quilimane. Livingstone had married at Mabotse Mary, eldest daughter of the Rev. R. Moffat, and now he found it necessary to send her, with their children, to England, that he might be free for this vast and perilous undertaking. To accomplish it occupied from 8th June 1852, when he left Capetown, to 26th May 1856, when he arrived at Quilimane. This journey was accomplished with a mere handful of followers, and a mere pittance of stores, amid sicknesses and other bodily troubles, perils, and difficulties without number. But a vast amount of valuable information was gathered respecting the country and its products, its geography and natural history, the native tribes, the regions that were favourable to health, and some great natural wonders, such as the Zambesi Falls. Livingstone, however, found that the London Missionary Society were not willing that he should be to so large an extent an explorer, and some time after returning to Britain he resigned his office as one of their missionaries.

At home Livingstone was welcomed with extraordinary enthusiasm, receiving the acknowledgments and honours of scientific societies, universities, town-councils, and other public bodies in every quarter of the country. In addition to these tokens of honour the fifteen months spent at home were signalised by three things: the writing of his book, *Missionary Travels* (1857), which was received with the liveliest interest; his visit to Cambridge, awakening the enthusiasm of many of the students, and leading to the formation afterwards of the 'Universities Mission'; and his appointment by Her Majesty's government as chief of an expedition for exploring the Zambesi and its tributaries and the regions adjacent.

On this expedition Livingstone set out on 10th March 1858. While successful in many ways, it led to not a little disappointment. Livingstone explored the Zambesi, the Shire, and the Rovuma; discovered lakes Shirwa and Nyassa, and came to a decided conclusion that Lake Nyassa and its neighbourhood was the best field for both commercial and missionary operations. His disappointments arose from the grievous defects of a steamer sent out to him by government; from the death of comrades and helpers, including his wife and Bishop Mackenzie; from the abandonment of the Universities Mission; from the opposition of the Portuguese authorities; but mainly from the distressing discovery that, encouraged by Portuguese traders, the slave-trade was extending in the district, and the slave-traders using his very discoveries to facilitate their infamous traffic. At length a despatch recalling the expedition was received, 2d July 1863. Livingstone at his own cost had brought out a new steamer, but she could not be put on the lake. Depressed though he was, he explored the northern banks of Lake

Nyassa on foot; then in his own vessel and under his own seamanship crossed the Indian Ocean to Bombay; and after a brief stay there, returned to Britain, reaching London on 23d July 1864.

At home Livingstone had two objects—to expose the atrocious deeds of the Portuguese slave-traders, and to find means of establishing a settlement for missions and commerce somewhere near the head of the Rovuma, or wherever a suitable locality could be found. His second book, *The Zambesi and its Tributaries* (1865), was designed to further these objects. He was again received with every demonstration of honour and regard. A proposal was made to him on the part of the Royal Geographical Society to return to Africa and settle a disputed question regarding the watershed of central Africa and the sources of the Nile. He said he would go only as a missionary, but was willing to help to solve the geographical problem. He set out in August 1865, *via* Bombay and Zanzibar. On 19th March 1866 he started from the latter place, first of all trying to find a suitable settlement, then striking westward in order to solve the geographical problem. Through the ill-behaviour of some of his attendants a report of his death was circulated, but an expedition headed by Mr E. D. Young, R.N., ascertained that the report was false. Livingstone pressed westward amid innumerable hardships, and in 1869 discovered Lakes Mooro and Bangweolo. All the while he was doing what he could for the religious enlightenment of the natives. Obligated to return for rest to Ujiji, where he found his goods squandered, he struck westward again as far as the river Luabala, thinking it might possibly be the Nile, but far from certain that it was not what it proved afterwards to be, the Congo. Returning after severe illness once more to Ujiji, Livingstone found Mr H. M. Stanley there, who had been sent to look for him by the proprietor of the *New York Herald*. But no consideration would induce him to return home till he had made one more effort to solve the geographical problem. He returned to Lake Bangweolo, but fell into wretched health. His sufferings always increasing, when he reached Chitambo's village in Ilala he was obliged to give in. On the morning of 1st May 1873 he was found by his attendants on his knees, dead. His faithful people embalmed his body as best they could, carried it amidst the greatest perils to the shore, where it was put on board a British cruiser, and on 18th April 1874 it was buried in Westminster Abbey. Among the remains brought home were his *Last Journals*, brought down to within a few days of his death; these were published in 1874. Stanley suggested the name of Livingstone for the main stream of the Congo (hence the Baptist Mission on the Lower Congo was called the 'Livingstone Inland Mission'), and Mr H. H. Johnston proposed that part of the East African territory acquired by Britain in 1890—the lower drainage area of the Zambesi—should be called Livingstone Land.

See Professor Blakie's *Personal Life of David Livingstone* (1880); the short *Life* by Thomas Hughes (1889); and Sir H. H. Johnston, *Livingstone and the Exploration of Central Africa* (1891).

Livingstonia Mission was based on a suggestion made by Dr Livingstone that Lake Nyassa (q.v.) was the best position for the establishment of a mission with a view to the annihilation of the Portuguese and Arab slave trade on the east of Africa. Its first settlement was at Cape Maclear at the south end of the lake; but this was abandoned in 1883 for a healthier site at Bandawe, half-way up the west shore. An expedition, costing about £6000, was equipped in 1875 by the Free Church of Scotland for establishing the

mission here; and another station, called Blantyre, after Livingstone's birthplace, was planted in 1876 by the Established Church of Scotland in the Shire Highlands, within easy distance of the lake. As yet the chief industries are iron manufacture, basket-making, and cloth manufacture from the bark of trees and cotton. With the exception of the 70 miles of the Murchison Falls, there exists unbroken water-communication between the head of Nyassa and the Indian Ocean. The African Lakes Company has done much to promote missions, civilisation, and commerce. It blasted a road from the north end of Nyassa up the heights to the plateau between it and Tanganyika, at a cost of £4000, supplied by Mr Stevenson, after whom the road is named. It launched steamers, educated the natives in handicrafts, and had to stand the brunt of attacks from savage neighbours, Arab slave traders, and Portuguese hostility. But since 1890 the country is under the British flag, and is part of Nyassaland (see NYASSA) or British Central Africa.

Livius. See LIVY.

Livius Andronicus, the father of Roman dramatic and epic poetry, was a Greek by birth, probably a native of Tarentum, and was carried a slave to Rome in 272 B.C., but afterwards liberated by his master. He translated the *Odyssey* into Latin Saturnian verse, and wrote tragedies, comedies, and hymns after Greek models. Mere fragments are extant, collected in L. Müller's *Livii Andronicæ et Cæ. Nævi Fabularum Reliquiæ* (1885). See LATIN.

Livonia (Ger. *Litland*), one of the three Baltic provinces of Russia, to which belong also the islands of Oesel, Mohl, and Kuno, contains an area of 18,153 sq. m. It forms the eastern side of the Gulf of Riga, and lies between Esthonia on the north and Courland on the south, being separated from this latter by the river Dwina. The country is mostly flat, and nearly one-fourth of it is covered with forests. Lakes and streams and marshes are common. The soil is only of moderate fertility; nevertheless agriculture, the chief occupation, is carried on in a skilful manner, rye, barley, oats, flax, and potatoes being the principal crops. Distilling, brewing, iron-founding, oil-pressing, and cork, wool, and paper manufacture are the more important industries. Sawmills are active. The fisheries are valuable. Pop. (1870) 1,000,876; (1893) 1,270,530, of whom 43 per cent. are Letts, 41½ per cent. Esthonians, 8 per cent. Germans, and 5 per cent. Russians. The Livonians proper, a Finnic race akin to the Esthonians, have dwindled down to about 2400. Capital, Riga; other towns, Dorpat, Pernau, Wenden. In the first decade of the 13th century the principality was given to the Knights of the Order of the Sword, who in 1237 were merged in the order of the Teutonic Knights, and maintained their sovereignty against the Archbishop of Riga, and against Sweden, Poland, Lithuania, and Russia down to past the middle of the 16th century. From that time Livonia was a bone of contention between Poland, Sweden, and Russia, until its incorporation with the last-named country in 1721. Since the middle of the 19th century, and especially since 1881, the Russians have made determined efforts to 'russify' the province.

Livorno. See LEGHORN.

Livre, the name of an ancient French coin, derived from the Roman *Libra*. There were livres of different values, the most important being the *Livre Tournois* (of Tours), which was considered the standard, and the *Livre Parisis* (of Paris), which was equal to five-fourths of a livre Tournois. It was divided into 20 sous, each of 12 deniers. In

1795 the livre was superseded by the franc (80 francs = 81 livres Tournois). LIVRE was also the ancient French unit of weight, and was equal to about 1 lb. avoirdupois; the kilogramme (see GRAMME) has taken its place.

Livy. TITUS LIVIUS (59 B.C. 17 A.D.), Rome's greatest historian, was born, according to St. Jerome, at Patavium (now Padua) in the Venetian province, in Julius Caesar's first consulship. Of a noble and wealthy family, he received the usual education in rhetoric and philosophy, and on coming to Rome was admitted to the court of Augustus. Independent in character and means, he never flattered the emperor like Virgil and Horace, but, avowing his preference for the republic over the monarchy, he foresaw in the growth of luxury the fall of the empire, and in the loss of freedom the end of Rome. He praised Brutus and Cassius and sympathised with Pompey, at the same time stigmatising Cicero, an accessory to the murder of Caesar, as having got from Antony's bravo's only his deserts. Of the great Caesar himself he doubted whether he was more of a curse or a blessing to the commonwealth; and throughout his history he seems to have mentioned Augustus but twice, and that incidentally—though in reply to the Greek Timagenes, the detractor while the guest of Augustus, he says that by restoring peace and allaying civil strife the emperor had reinvigorated Rome to overcome a thousand armies more formidable than the Macedonian Alexander's. Such friendship as they had for each other Livy and Augustus never lost—Augustus taking a lively interest in the progress of Livy's work, while Livy seems to have been still intimate enough at court to exhort the future Emperor Claudius (born 10 B.C.) to the study of history. Livy had a son, also, it is believed, a man of letters, and a daughter married to Magnus the rhetorician. He visited various parts of Italy—among them Campania and the Neapolitan seaboard, and, probably in disgust at the abasement of the senate and the cruelties of Tiberius, he returned to his native Patavium to die.

Livy's work, recording the history of Rome from her foundation to the death of Drusus, 9 B.C., was published in instalments, and comprised 142 books, of which those from the 11th to the 20th, and from the 46th to the 142d, have been lost. Of the 35 that remain the 41st and 43d are imperfect. The last writer to notice the history as still entire is Priscian the grammarian (5th century). Its voluminousness, the labour and cost of transcription, and possibly the vindictive hatred of emperors, like Caligula, to its republican spirit, combined, it is supposed, to lessen the number of copies, till those that survived must have perished in whole or in part, with such pagan libraries as Gregory the Great is known to have burned. The hope, renewed at intervals, of recovering the lost books has never been realised; the 'periœche,' or summaries of the contents of each book, composed in the wane of Roman literature, to catalogue names and events for rhetorical purposes, have all, however, come down to us, except those of books 136 and 137. But what has been spared is more than enough to confirm in modern days the judgment of antiquity which places Livy in the forefront of Latin writers. His impartiality, subject always to a conviction just escaping Chauvinism that Rome morally and materially was the greatest 'birth of time,' is not less a note of his work than his veneration for the good, the generous, the heroic in man. His style, save where the text still defies the commentator, is as nearly perfect as is compatible with his ideal of the historian. The narrative flows deep and full, never straying beyond its banks nor growing turbid within them, picturesque on all due occasions,

interesting and animated through historic traits often dreary in themselves. Niebuhr found in his rich, at times sombre, glow of colour another proof of his Venetian origin; certainly for portraiture of character he is the Titan of historians. The fastidious, possibly jealous, Asinius Pollio detected in his Latinity a provincialism odious to Patavium, but latter-day scholars seek for this 'Patavinitas' in vain—find, in fact, nothing more than the first faint streaks of the silver age revealed in an occasional preference for poetic diction. His defects in the 'fierce light' of modern research are more apparent to us than even to his contemporaries. For investigation of facts he did not go far afield; our own Hume is not more of an arm-chair historian. He declined even at the instance of Augustus to verify an important inscription in the temple of Jupiter Feretrius, and he omitted to consult the epigraphs inscribed in the temple of Diana on the Aventine, the treaties concluded by Rome with Gabii and Aiden, even the Julian law which Dionysius examined with such pains. Accepting history as fine art rather than as science, he was content to take his authorities as he found them, and where they differed to act the eclectic, guided by taste or predilection. Yet his work remains monumental, in spite of all the streaks in the marble, and the modern reader never fails to appreciate that impulse of the Spaniard from Gades who made a pilgrimage to Rome just to see Livy, and having done so returned satisfied.

The bibliography accumulated round Livy is a library in itself. Gronovius, Drakenborch, Rudiman, and, in our own day, Matvig, Alsheiski, Weissenborn, and Cocchia have contributed much to purify his text and illustrate his meaning. He has yet to find an adequate translator in English, though meritorious versions of parts of his history (that of Church and Brodribb for example, Books XXI.—XXV.) have been published, and there is a translation of the whole, in fine Elizabethan English, by Philemon Holland (1600). See the book by the Rev. W. W. Capes in 'Classical Writers' 1879; J. H. Taine's *Essai sur Titus Live* (1860); and Prof. Seeley's introduction to his edition of Book i. (1871).

Lixiviation (Lat. *lix*, 'ashes'), a term employed in chemistry to denote the process of washing or steeping certain substances in a fluid, for the purpose of dissolving a portion of their ingredients, and so separating them from the insoluble residue. Thus, wood-ash is lixiviated with water to dissolve out the carbonates of soda and potash from the insoluble parts. The solution thus obtained is called a *lixivium*, or *lyx*.

Lixouri, a thriving town in Cephalonia, on the west side of the Gulf of Argostoli. It lies opposite the capital, Argostoli (q.v.), at a distance of less than 3 miles, though the road round the gulf is nearly 20 miles long. Pop. 8000.

Lizard Point. See CORNWALL.

Lizards (*Lacertilia*), an order of reptiles occupying a somewhat central position in that class. The body is usually well covered with scales, reaching a climax in the tubercles and spines covering the Australian molech, but very much reduced in the geckos and amphibienas. There are generally fore and hind limbs, but either pair may be lost, or both in such serpent-like forms as the slow worm (*Anguis fragilis*) and the amphibienas. Shoulder and hip girdles are always present, in rudiment at least. Unlike snakes, lizards have non-expandible mouths, and almost always movable eyelids and external ear-openings. The teeth are fixed to the jaws, not planted in sockets; the protrusible tongue, broad and short in geckos, agamas, and iguanas, long and terminally clubbed in chameleons, is in most lizards a narrow, worm-like, bifid organ of touch. There is a transverse cloacal aperture, a urinary bladder, and a double copulatory organ.

Most are oviparous, but a few—e.g. the slow-worm and our British *Lacerta vivipara*—bring forth their young living. Lizards, though most abundant in the tropics, and absent from very cold countries, are virtually world wide in distribution. There is one marine form, *Oroscoptes*; *Anolis* (class *opisthopterus*), from the Galapagos; most of the rest are terrestrial. Yet the geckos climb on rocks and trees, the giant Varanids are semi-aquatic, the amphibiaenas are subterranean, and the arboreal dragons (*Draco*) take long swoops through the air from branch to branch. The food generally consists of insects, worms, and similar small animals, but some prey upon larger animals, and others are vegetarian. Lizards are usually active, agile animals, beautifully and often protectively coloured. They are noteworthy for brittleness in the caudal region, and for their power of reproducing lost tails or even legs. Among the most remarkable forms may be noted the Geckos (q.v.); the large monitors (*Varanus*), which attain a length of six feet, and prey upon small mammals, birds, frogs, fishes, and eggs; the poisonous Mexican lizard, *Holbrookia horvathi*, with large poison-gland and fang-like teeth; the worm-like Amphibiaenas; the Slow worm, which illustrates so well the tendency lizards have to break in the spasms of capture; the large Iguanas, which frequent tropical American forests, and feed on leaves and fruit; the sluggish spiny 'Horned Toads' (*Phrynosoma*); the Agamas, taking the place of the Iguanas in the Old World; the Flying Dragon (q.v.); the Australian frilled lizard (*Chlamydosaurus*), with a peculiar collar of skin; the repulsive molech; and the divergent Chamaeleons (q.v.). The unique New Zealand lizard, *Sphenodon* or *Hatteria*, with its remarkable persistent pineal

Common Lizard (*Lacerta vivipara*).

eye, is to be regarded as the sole survivor of a distinct order, *Rhynchocephalia* (see SPHENODON). There are four British lizards, the commonest being *Lacerta vivipara* and the Slow-worm. Two other species of *Lacerta*—*L. agilis* and the green *L. viridis*—have a local distribution in the south of England and the Channel Islands. The modern forms are classified in twenty-one families, including over 1600 species. Though *Lacertilla* probably began about the Permian times, their remains are not numerous before Tertiary strata. See G. A. Boulenger, Catalogue of the Lizards in the British Museum (3 vols. 1885-87).

Llama, or LAMA (*Lachania lama*), a most useful South American ruminant of the camel family. It is probably a domesticated variety of the guanaco (*Lachania guanaco*), whose herds roam with the rheas on the plains of Patagonia, or climb on the Cordilleras. As a beast of burden the llama was in general use at the time of the Spanish conquest, and its sure-footedness and power

of foraging for itself make it most valuable for transport in the rough and steep mining regions of the Andes. In many places, however, mules have to some extent replaced the llamas. The males carry a hundredweight about twelve miles in a day. The females, which are kept for breeding,

Llama (*Lachania lama*).

are smaller and less strong than the males. The animal is larger and stouter than the allied species the Alpaca (q.v.), stands about three feet high at the shoulders, and keeps its head raised. It is gentle and docile, but is likely enough to squirt its yellow spittle in the face of tormentors. The hair, which may be black or white, reddish or yellowish, is too rough to be much used except for coarse materials and string; the flesh of the young animal is good to eat.

Llanberis, the 'Chamonix of Wales,' 9 miles ESE. of Carnarvon, lies at the north-west base of Snowdon, and near the foot of the wild Pass of Llanberis. The two lakes of Llanberis, 2 and 14 miles long, are sadly disfigured by slate-quarries. Pop. of parish (1861) 1364; (1881) 3033; (1891) 2818.

Llandaff, a small town of Glamorganshire, on the right bank of the Taf, 2 miles NW. of Cardiff (q.v.). It is the seat of a very ancient bishopric, said to have been founded by St. Dubricius, who died in 612, and among whose successors have been St. Teilo and Bishops Godwin, Shute Barrington, Richard Watson, Sumner, and Copleston. The cathedral church, in virtue of which Llandaff is a 'city,' one of the smallest in Britain—was built between 1120 and the first half of the 15th century, and is mainly Early English in style. It had fallen into utter ruin in 1575, but in 1735-52 was barbarously patched up into an 'Italian temple.' In 1833-69 it was thoroughly restored. Pop. 2747. See works by E. A. Freeman (1850), Bishop Ollivant (1860), and R. J. King (1873).

Llandilo, a town of South Wales, on the Towy, 14 miles ENE. of Carmarthen. It gives name to a group of Silurian strata. Pop. 1533.

Llandovery, a municipal borough (1841) of South Wales, on the Bran, 25 miles ENE. of Carmarthen. It gives name to a group of Silurian strata. Pop. 1728.

Llandudno, a fashionable watering place in Carnarvonshire, North Wales, is situated on the level neck of a promontory between the Great and Little Orme's Heads, 48 miles by rail WNW. of Chester. Its bracing and delightful climate, its good sea-bathing, and its picturesque surroundings—the Great Orme's Head (700 feet) commanding views of Snowdon and Anglesey, and even of Man and the Cumber-land mountains—have combined to raise Llandudno since 1841 from a small fishing-village to a yearly resort of some 20,000 visitors,

with many hotels and boarding-houses, hydro-paths, a fine promenade, a pier (1250 feet), a 'marine drive' (5½ miles), &c. Resident pop. (1851) 1131; (1881) 4839; (1891) 6065.

Llanelli, a manufacturing town and seaport of Carmarthenshire, South Wales, 11 miles WNW. of Swansea. The mineral wealth of the vicinity, and the easy access to the sea, have raised it from a mere village in 1813 to a town of considerable commercial importance. The Cambrian copper-works employ a great number of the inhabitants; there are also silver, lead, iron, and tin works, potteries, chemical works, &c. Large docks have been constructed, and coal is largely exported. With Carmarthen it returns one member to parliament. Pop. (1851) 8710; (1881) 19,655; (1891) 24,307.

Llanfairfechan, a pleasant little watering-place of Carnarvonshire, North Wales, at the base of Penmaenmawr, 7 miles WSW. of Conway. Pop. of parish (1851) 809; (1891) 2407.

Llangollen, a town of Denbighshire, North Wales, picturesquely situated on the Dee, 22 miles SW. of Chester and 26 NW. of Shrewsbury. It has a town hall (1866) and flannel manufactures, and is visited by tourists on account of the beauty of the famous Vale of Llangollen, and for its antiquities, among which are Dinas Bran or Crow Castle, Valle Crucis Abbey (1200), and Elise's Pillar (8th or 9th century). Plas Newydd, ½ mile S. of the bridge, was for half a century the residence of the two Irish recluses, the 'Ladies of the Vale,' or 'Maids of Llangollen,' Lady Eleanor Butler (1745-1829) and Miss Sarah Ponsonby (1755-1831), who were visited here by Madame de Genlis, Miss Seward, De Quincey, and many other celebrities. Pop. 5546. See Simpson's *History of Llangollen* (3d ed. 1852).

Llanidloes, a municipal and parliamentary borough of Montgomeryshire, North Wales, on the Severn, 56½ miles NW. of Hereford by rail and 56 SW. of Shrewsbury. Its interesting church, built partly with materials from Cwmhir Abbey, was restored in 1882. Considerable manufactures of flannel and other woollen fabrics are carried on; and in the neighbourhood are extensive lead-mines. With Montgomery, &c., Llanidloes returns a member. Pop. (1851) 3045; (1881) 3421; (1891) 2574.

Llanos (Spain), 'plains,' from Lat. *platus*, 'level'; pron. *lga'nos*) are vast plains in the northern portion of South America, in some parts barren and sandy, in others covered with luxuriant grass and stocked with innumerable herds of cattle. Over great portions, however, there is a heavy growth of timber. The Baneros resemble the Gauchos (q.v.) farther south.

Llanthony, on the Honddu, in Monmouthshire, 20 miles N. of Abergavenny, a Cistercian abbey, founded in 1108. Its church and chapter-house form a fine ruin in the Transition Norman style. In the Prior's Lodge, now an inn, Walter Savage Landor lived for three years after his marriage, until driven away by worries that harassed all his life. He had spent much toil and money on attempts to improve the natural sterility of the soil. Four miles up the valley is Llanthony 'Monastery,' founded by 'Father Ignatius.'

Llerena, a town of Spain, 83 miles by rail N. of Seville. Near here the British cavalry routed the French cavalry on April 11, 1812. Pop. 5592.

Llewellyn. See BRICKNOCKSHIRE.

Llorente, JUAN ANTONIO, the historian of the Spanish Inquisition, was born at Rincón del Soto, near Calahorra, in 1756. He was trained for the priesthood and took orders early, but his studies were chiefly secular—history, archeology, and jurisprudence—and in his memoirs he confesses an

inclination to the French philosophy of the day. His advancement, however, was rapid. He became vicar-general of the diocese in 1782, agent of the Inquisition at Logroño in 1785, and canon of Calahorra and secretary to the Inquisition in 1789. The projected reforms in the procedure of the Holy Office brought him into close connection with Jovellanos, and the imprisonment of the minister drove him into retirement for a time; but in 1805 he found favour with Godoy, whom he served by justifying on historical grounds his attack on the fueros of the Basque Provinces. In 1806 he was made canon of Toledo, and was on the high road to a bishopric when Napoleon put a stop to his promotion. He was, however, included among the Notables assembled at Bayonne to ratify the French usurpation. King Joseph, who stood in need of adaptable Spaniards, gave him a seat in his council of state, and appointed him to sundry posts more or less connected with confiscation; and in 1809, when the Inquisition was suppressed, placed all its archives in his hands that he might write its history. But the times afforded little leisure for the task. The ebb and flow of war kept Joseph always on the move, and Llorente followed his fortunes with a fidelity that would be admirable but for the fact that his life was not safe among his own countrymen. After the battle of Vitoria he effected his retreat to Paris, and there, translated into French under his own eyes by Alexis Pellié, the work came out at last in 1817-18. The Spanish edition did not appear till 1822, as the Inquisition, restored by Ferdinand, survived till 1820. The value and importance of the book, notwithstanding its want of method, were recognised at once. There was a 2d edition in 1818, and translations in German, English, and Italian followed speedily; but it provoked bitter feeling, to which Llorente added in 1822 by his *Portrait Politique des Papes*, and at the instance of the clerical party he was ordered to quit France forthwith. He set out for Madrid, and a few days after his arrival died (February 5, 1823), broken down by the fatigues of a hasty journey in severe winter weather. Llorente's time-serving character, his animus against the Inquisition, the Church, and the pope, and his admission of having burned documents have been urged as reasons against his trustworthiness. But the most learned of his opponents, Hefele, can bring no graver charge against him than that the number he gives for the victims at Seville in one year should have been distributed over several years and among several cities. His account of the burning of some of the papers is perfectly straightforward, and his sentiments as to the Inquisition are always frankly declared. It is open, of course, to its apologists to say that he may have kept back facts in its favour, but critics of unimpeachable impartiality and competence, Prescott, Ticknor, and Buckle, to name no others, testify to the accuracy and honesty of his work. His minor works, some twenty or thirty in number, include an account of the origin of the fueros of the Basque Provinces; the Annals of the Inquisition as far as the year 1530; a short autobiography, in which he defends his French partisanship as prudent patriotism; and his *Critical Observations on Gil Blas* (1822). See ISLA and LE SAGE.

Lloyd's is in the first place an association of underwriters, each of whom conducts his business according to his own views. For those views, or for the business transacted by individual underwriters, Lloyd's as a corporation is in no way responsible, except that the committee of Lloyd's before the election of any underwriting member requires that the candidate shall place in the hands of the committee security to meet his underwriting liabilities. For many years this custom has prevailed,

and the total securities thus placed at the disposal of the committee of Lloyd's amount to about £4,000,000. It is difficult to estimate the value of property annually insured at Lloyd's, but it probably amounts to about £400,000,000. Lloyd's as a corporation, and the committee as its executive, have little to do with marine insurance. Their business is to conduct the affairs of Lloyd's in its corporate capacity, to carry out the supply and distribution of shipping intelligence, and to guard as trustees the corporate funds and corporate property.

The name of Lloyd's is derived from a coffee-house kept by Mr Edward Lloyd in the 17th century. In 1692 Lloyd's coffee-house moved from Tower Street to Lombard Street, where it became the centre of shipping and underwriting business; and in 1774 Lloyd's moved from the coffee-house in Lombard Street to the north-eastern premises of the Royal Exchange, where it occupied, on the first floor, the rooms hitherto held by the East India Company. The wars, which lasted from 1775 with but short pauses till 1815, raised Lloyd's to the high position which it now holds, bringing home to merchants the necessity of covering their risks as effectually as possible. High premiums adequate to high risks were offered. Merchants of wealth became insurers of property afloat, and tens of thousands were written in the names of single underwriters at Lloyd's. The wars had the effect of bringing foreign marine insurance from all parts of the world to Great Britain, since the security of Lloyd's then, as now, was unequalled in the world. The membership of Lloyd's has greatly increased: in 1850 there were 210 underwriting members; in 1890, 592.

In the second place, Lloyd's is an enormous organisation for the collection and distribution of marine intelligence. The intelligence department of Lloyd's was originally established at Lloyd's coffee-house to meet the public desire for information with regard to vessels at sea. *Lloyd's News* was established in 1696, and reconstituted in 1726 under the name of *Lloyd's List*, which is thus the oldest newspaper existing in Europe at the present time, with the exception of the *London Gazette*. The intelligence department at Lloyd's has continually developed. During the Napoleonic wars the government was often indebted to the committee of Lloyd's for the earliest information of transactions all over the world.

The great wealth of Lloyd's, and the fortunes made there, attracted general attention, and in 1810 parliament appointed a committee to inquire into the affairs of the institution. From this inquiry Lloyd's emerged victoriously, and since that time has continued to assist in the promotion of every measure which might aid in the preservation of life at sea, the prevention of fraud in connection with marine insurance, and the rapid collection and distribution of maritime intelligence to all interested. The corporation has its agents in every port, and there is no line of sea-coast in the whole world which is not watched by some representative of Lloyd's. In 1871 Lloyd's was incorporated by act of parliament. The general introduction of telegraphy has caused an enormous development of the information received at and distributed from Lloyd's. Various works are published by the corporation for the benefit of the mercantile community, such as *Lloyd's List*, *Lloyd's Weekly Shipping Index*, and *Lloyd's Confidential Index*, *The Mercantile Navy List*, *International Code List*, and *British Code List* are edited by the Registrar general of Seamen, and published by Lloyd's. At Lloyd's is also maintained a *Captains' Register*, showing the services of every master in the mercantile marine; and much confidential information of great value to

underwriters is collected in the secretary's office for the benefit of members and subscribers to the corporation.

The value of signal-stations as a means of providing early shipping information is great, not only to underwriters, but to owners of vessels and cargoes, as it is frequently of advantage that a vessel making for some particular port should be intercepted and ordered to some other port. Vessels arriving off outlying signal-stations bring important intelligence as to derelicts and wrecks passed on their voyages; as also information of vessels in distress and requiring assistance. Vessels arriving from long voyages overboard are also reported at these stations. Not one vessel in ten bound to ports in the United Kingdom from distant ports arrives at her terminal port without first being reported from one of Lloyd's signal-stations. The corporation of Lloyd's now holds a similar position with regard to signal stations to that occupied by the corporation of the Trinity House with regard to lighthouses. These valuable aids in the preservation of life and property are one of the latest developments of this great corporation. Lloyd's also maintains an 'Inquiry Office,' where the relations of the crew or passengers in any vessel may obtain information without cost concerning the movements of that vessel or any other matter of interest to them.

LLOYD'S REGISTER is a society voluntarily maintained by the shipping community with the primary object of classifying vessels according to their strength and efficiency for the safe carriage of cargoes. It is the recognised authority on such matters in the United Kingdom, and also to a very considerable extent in foreign countries. The society's affairs are managed by a committee of fifty members, composed of merchants, shipowners, and underwriters, elected to represent the important shipping centres of the country. The numerous duties of the society are executed under the control of the committee by a staff of 134 ship and engineer surveyors in the United Kingdom, and of 121 appointed at the principal foreign ports. Rules are published annually by the society, embodying the best current practice in the construction of ships and engines. Both new and old vessels can be classed under these rules. In the case of a new vessel the plans for construction are in the first instance submitted to the committee, by whom they are examined and returned with such modifications as are considered requisite. The building of the vessel then proceeds under the supervision of the local surveyor, and when she is completed the surveyor forwards a detailed report for the consideration of the committee by whom the character is assigned.

Wood ships are assigned the character A1 as a first class for a term of years varying according to the materials and fastenings used in their construction. Lower grades of character are expressed by the symbols A1 in red and E. Iron and steel vessels are classed for an indefinite period under a system of frequent surveys, the varying degrees of strength being indicated by the characters 100A1, 90A1, and 80A1. Nearly 90 per cent. of the tonnage constructed in the United Kingdom is built under the supervision of the society's surveyors and classed in the register book. Altogether, over 8000 vessels of nine and a quarter million tons hold a classification assigned by Lloyd's Register, subject to periodical inspection by the society's officers.

The inspection of the machinery and boilers of steam-vessels during and after construction comes also within the scope of the society's functions. Under the authority of government it controls the testing of anchors and chains at eight out of the nine proving houses in the country, in accordance

with the provisions of the Chain and Anchor Act of 1871. It tests the steel intended for use in constructing ships and boilers, and inspects large forgings and castings; it provides for the survey and classification of yachts; and it has been entrusted by government with the fixing of maximum load-lines to merchant-vessels.

Lloyd's Register issues annually to its subscribers a register containing particulars of the classification of vessels to which characters have been assigned, together with many other details, constituting a very full record of their construction, history, &c. All other sea-going vessels of the world of 100 tons and upwards are included in the work, which contains particulars of the age, build, tonnage, dimensions, ownership, &c. of some 32,000 vessels. The society has existed in its present form since 1834, when it superseded two rival institutions having a similar object. The offices of the society are situated in White Lion Court, Cornhill, London.

Amongst several marine institutions bearing the name of Lloyd in different parts of the world, the most important are the Austrian and the North-German Lloyd. The former has its seat at Trieste, it was organised as a marine insurance society in 1833, but three years later enlarged the sphere of its activity by founding also a share company for steam-navigation to the Levant and Black Sea. Its vessels also traverse the Red Sea and the Indian Ocean, going as far as Hong-kong. The North-German Lloyd is primarily a shipping company, whose headquarters are at Bremen. It was founded in 1857, and maintains communication by means of large, swift, and excellently equipped ocean steamships with New York and Baltimore, Brazil and the River Plate, and (since 1885) with eastern Asia and Australia. See F. Martin's *History of Lloyd's* (1875), *Annals of Lloyd's Register* (1884), and *Chambers's Journal* (1886).

Lloyd's Bonds are obligations by railway companies under their seal, purporting to be for work done, or for materials supplied for the purposes of an undertaking, and covenanting to pay the debt and interest thereon. They were devised by the eminent English counsel, John Horatio Lloyd, to enable railway companies to exceed the powers of borrowing money granted to them by parliament. The issue of these bonds has sometimes been abused, being made without consent of the shareholders or of the statutory debenture holders of the company; but they are valid only when granted in *bona fide* to contractors and others, for work actually done, or materials supplied. They cannot be given for a mere loan of money to the company; and a company issuing them otherwise than authorised by statute forfeits to the crown the amount of the bond.

Llywarch Hen. See WALLS (LITERATURE).

Loach, a name applied to the members of a group of fresh-water fishes in the carp family (Cyprinidae). The mouth bears six or more barbels; the scales are small or absent; the air-bladder is more or less enclosed in bone. Most belong to the genus *Nemachilus*, which includes numerous carnivorous and edible forms frequenting rapid streams, and represented in Britain by *N. barbatus*, called in Scotland the *Baracha*. It is a small fish, about 4 inches long, of a yellowish white colour, with brown spots. The largest European form, *Mesogobius fossilis*, not uncommon in Germany, approaches a foot in length. A rare British species is *Cobitis loachi*. See Günther's *Introduction to the Study of Fishes* (Edin. 1880).

Load-line. See PLIMSOLL.

Loadstone, or MAGNETIC IRON ORE, a mineral consisting of a mixture of the ferric and ferrous oxides, $FeO \cdot Fe_2O_3$, or Fe_3O_4 , remarkable for

its highly magnetic quality. The name loadstone or lodestone ('leading stone') is derived from its power of drawing or leading bits of iron; the earliest magnets were pieces of loadstone, and the value of the ore for making a mariner's compass (see COMPASS) was early known; 'the lodestarr [polestar] draweth the lodestone as the lodestone the steel.' Loadstone is black, and has a metallic lustre; its hardness = 5.5 to 6.5, and its specific gravity = 4.9 to 5.2. It is one of the most common constituents of eruptive rocks, occurring in these generally in the form of small octahedra or irregular grains. Some rocks, such as certain basalts, contain so much magnetite as strongly to affect the compass. Larger and well defined crystals are met with in the crystalline schists, more especially in chlorite schist. Magnetite also occurs massive, associated with other iron ores, forming in some places irregular bedded sheets amongst the crystalline schists, and in other places entering largely into the composition of mountains, as in Sweden one of the richest iron-bearing regions in the world. The iron sands which occur here and there in river-beds and along certain sea coasts consist of magnetite which has been derived from the degradation of eruptive rocks.

Many strange beliefs have been held about the properties of the loadstone, and an interesting account of the true and untrue among these is given by Sir Thomas Browne in his *Polygraph Errors* (book ii, chaps. 2, 3). Thus, one species was said to attract flesh; again, its operation was hindered by garlic, by the diamond, by quicksilver. Heavy bodies such as chariots of iron could be suspended in the air by systems of magnets arranged. Again, it possessed valuable medicinal properties in cases of dropsy, ruptures, and gout; and had, moreover, magical efficacy to detect incontinence and theft, to divine, and to afford means of communication with absent friends.

Loan. See SOILS.

Loan, an express or implied contract whereby the property of one person is transferred into the possession of another, the borrower undertaking to return the thing or money lent to the owner. The delivery of chattels (movable property) by way of loan or deposit is in English law called a bailment. When goods are thus delivered merely for the convenience of the owner, as in the case of goods kept by a friend without charge, the depositary is liable only for gross negligence. If they are delivered merely for the advantage of the bailee, as in the case of a gratuitous loan, the depositary is bound to use the strictest diligence. Where the arrangement is for the advantage of both parties, as in the case of furniture hired from a shop, ordinary diligence will suffice.

A loan of money is usually made on an undertaking by the borrower to repay the money lent, and to pay interest thereon. The rate of interest was formerly restricted by the laws against Usury (q.v.), but there is now no law in the United Kingdom to prevent a lender from stipulating for any interest, however exorbitant. A lender has, of course, a right of action against the borrower; but he generally endeavours to secure himself by obtaining some special and easily enforced right against the debtor and his property. He may, for example, take a bill of exchange or promissory note for the amount, so as to acquire the special rights which the law confers on the holder of a negotiable instrument. Or he may secure himself by obtaining specific rights over some part of the debtor's property. Thus, the debtor may give him possession of some part of his property by way of Pawn (q.v.); or, if he retains possession of his property, he may make a

formal conveyance of it to the creditor by way of Mortgage (q.v.).

Loans are contracted not only by individuals, but by governments and public bodies. The aggregate debts of municipal corporations in the United Kingdom is very large, and the National Debt (q.v.) amounts to nearly 700 millions sterling. Loans of this class consist of capital sums, advanced for the most part by private persons, in consideration of payment of principal and interest or in consideration of annuities paid to the lender. When the subjects of one state lend money to the government of another, as, for example, when English investors buy Turkish bonds, international questions may arise in regard to payment. But it is now an accepted maxim that investors as such have no claim to the assistance of their government. When people lend money to Turkey they do so to obtain a high rate of interest; and they know, or ought to know, that 'high interest means bad security.' See C. Cotton's *Loans Manual* (1891).

Loanda, SAINT PAUL DE, chief town of the Portuguese possessions on the West Coast of Africa, lies on a small bay, some 210 miles S. of the mouth of the Congo. It has broad, tree-shaded but dirty streets, several churches, forts (1578), and the residences of the governor and bishop. The harbour is gradually sanding up, so that vessels lie $1\frac{1}{2}$ mile from shore. In 1888-92 a railway was made to Ambaca, 140 miles inland; gas was introduced in 1893. Pop. 50,000, of whom about 15,000 are Europeans.

Loango, a coast district of West Africa, stretching northwards from the mouth of the Congo to about 4 S. lat. By the Berlin conference of 1885 it was divided between the Congo Free State, Portugal, and France. The natural features and productions do not differ from those of the adjacent parts of Africa (see CONGO, GABON). The inhabitants, who call themselves Batiotes, are fetish-worshippers. The town Loango, formerly a place of 15,000 people, consists now of only a few mercantile establishments.

Loasaceæ, a natural order of calycifloral exogens, natives of America, and chiefly from the temperate and warmer parts of it. There are about seventy known species, herbaceous plants, hispid with stinging hairs. The genus *Loasa* sometimes receives the popular name of *Chili Nettle*.

Löban, a town of east Saxony, 12 miles SE. of Bautzen, has mineral springs and manufactures of linens, cottons, woollens, &c. Pop. 6977.

Lobelia, a genus of corollifloral exogens of the natural order Lobeliaceæ, named after the French botanist Matthias de Lobel (1538-1616). This order is nearly allied to Campanulaceæ, one of the most conspicuous differences being the irregular corolla. It contains almost 100 known species, natives of tropical and temperate climates, abounding chiefly in damp woods in America and the north of India. They are generally herbaceous or half-shrubby, and have a milky juice which often contains much esautheone. A poisonous character belongs to the order, and some are excessively acrid, as *Tupa foetida*, a Chilean and Peruvian plant, of which the very smell excites vomiting; yet the succulent fruit of one species, *Centropogon surinamensis*, is eatable. The genus *Lobelia* is the only one of this order of which any species are British. The Water Lobelia (*L. Dortmannii*) is frequent in lakes with gravelly bottom, often forming a green carpet underneath the water with its densely matted sub-cylindrical leaves. The flowers are blue, the flowering stems rising above the water. To this genus belong many favourite garden-flowers, as the beautiful Cardinal Flowers (*L. cardinalis*, *L. fulgens*, and *L. splendens*) and the Blue Cardinal (*L. siphilitica*), natives of the warmer

parts of North America, perennials, which it is usual to protect during winter in Britain. To this genus belongs also the Indian Tobacco of North America (*L. inflata*), an annual, with an erect stem, a foot high or more, with blue flowers, which has been used as a medicine from time immemorial by the aborigines of North America; both the flowering-herb and the seeds are imported into Britain. It is the former, compressed in oblong cakes, which is

Lobelia crinita (garden variety).

chiefly employed. A liquid alkaloid, *Lobeline*, and a peculiar acid, *Lobelic acid*, have been obtained from it. In small doses it acts as diaphoretic and expectorant; in full doses, as a powerful nauseating emetic; while in excessive doses, or in full doses too often repeated, it is a powerful acro-narcotic poison. It is the favourite remedy of a special class of empirics, and consequently deaths from its administration are by no means rare. Physicians seldom prescribe it now, except in cases of asthma.

Lob Nor, a dried-up lake of central Asia, in the desert of Gobi. Pejevalski in 1885 found 400 persons, mixed Turks and Mongols, settled on its confines. See ASIA, Vol. I, p. 486.

Lobo, JERONIMO, a Jesuit missionary, born at Lisbon in 1593, went out to India in 1621, but travelled back to Abyssinia in 1625, and was for nearly ten years superintendent of missions in Tigre. He died at Lisbon in 1678. From Lobo's Portuguese MS. account of his travels in Abyssinia the Abbé Legrand published a French translation in 1728, and of this again Dr Johnson produced an abridged English version in 1735—his first work. Sir Peter Wyche also translated into English parts of Lobo's MS. in 1669.

Lobos Islands, two small groups of rocky islands, about 12 miles off the coast of Peru, famous for the great quantity of guano which they produced.

Lobster (*Homarus vulgaris*), a species of Crustacean, of the order Decapoda, sub-order Macrura (see CRAYFISH). It differs from the crayfish principally in the following characters: the last ring of the thorax is not movable, but continuous with the rest; the scale of the antenna is small; there are twenty branchie on each side, and the claws are very powerful and unequal. One claw, usually the left, is thicker, more globose and heavier than the other, the biting edges being furnished with blunt tubercles of different sizes; the other claw is more slender and elongated, and its biting-edges are furnished with numerous small teeth. As an exception two claws, both of one kind or the other, may occur in the same individual. The colour during life is a beautifully clouded and varied bluish black, which changes to a nearly uniform red on boiling. It sometimes attains to the weight of 12 or 14 lb. when loaded

with spawn, although a lobster of 1 lb. weight or even less is deemed very fit for the market. The eggs (2000 to 12,000, of which perhaps 1000 are hatched) are deposited from the oviducts in autumn, and then become attached by adhesive threads to the swimmerets or abdominal appendages of the female. They are carried by the parent in this manner for several months, finally hatching about June and July of the following summer. When hatched the young swim about actively in the water, not at first crawling or walking like the adults. They differ from the adults in structure, chiefly in having outer appendages to the thoracic limbs; when first hatched they are about half an inch in length. Lobsters are exclusively carnivorous and very voracious. They are also very pugnacious, and in their combats often lose their limbs. But they exhibit in a remarkable degree the phenomenon of reescence, limbs rapidly growing again of the same form and structure as

Norway Lobster (*Nephrops norvegicus*).

those that have been removed, though several moults are required before the full size of the new member is attained. Moulting, or the casting of the shell, occurs in adult lobsters once a year, in the young much oftener, in very old individuals not so often. The creatures are fairly abundant on the coasts of the British Islands and other parts of Europe. They are caught for the market in traps made either of basket-work or of netting stretched on wooden frames, each trap having one or more re-entrant orifices for the entrance of the lobsters. The traps are baited with dead fish. In 1885-95 the number of lobsters landed annually on the coasts of England and Wales varied between 500,000 and 700,000. The landing price is from £1. 5s. to £1. 10s. per 100. In 1890 a lobster-pond was undertaken at Lochbuie in Mull. The American Lobster (*H. americanus*) and the Cape Lobster (*H. capensis*) are the only other species known of the genus Homarus. The former is as valuable as the European species; its claws are much larger than those of the latter. Great quantities are canned and exported from Nova Scotia and New Brunswick, and from Portland, Maine, &c. The Norway Lobster (*Nephrops norvegicus*) is frequently taken on the British coasts, and appears in the markets. The eyes are kidney-shaped, and not round, as in the common lobster. The claws have also a more slender and prismatic form, and the colour is a pale flesh colour. It is said by some to be the most delicate of all the crustaceans; by others, to be inferior to the common lobster. The

Spiny Lobster, or Sea Crayfish (*Palinurus vulgaris*), is not uncommon on the rocky coasts of Britain, particularly in the south. It is believed to be the *Karabos* of the Greeks, and the *Loenusta* of the Romans. It attains a length of about 18 inches. The shell is very hard, and the whole body is rough with short spines. The antennae are very long, much longer than those of the common lobster. There are no claws or pincers, the first pair of feet being very similar to the others. The Spiny lobster is brought to market in London and elsewhere, but is inferior to the common lobster. Other species of these genera are found in other parts of the world. For anatomy, &c., see Huxley, *The Crayfish* (1880).

Lobworm, or LUGWORM (*Arenicola piscatorum*), one of the more sedentary Chaetopods, extremely abundant on the British shores, and very valuable as bait. It lives head downwards in a hole in the sand, which is partly lined by a yellowish-green agglutinating secretion from the skin of the worm. The hole is made as the animal cuts its way in earthworm-like fashion, and the devoured material, from which small organisms and organic debris are extracted, is passed out on the surface as spiral coils or 'casts,' familiar to every one who has walked over a low-tide stretch of sand. The animal is larger than the earthworm, sometimes a foot in length, and greenish brown in colour. The body is divided into a thickened anterior region, a median part with thirteen pairs of gill-tufts brightly coloured by the red blood, and a thinner posterior portion. The appendages are degenerate, but are represented by two rows of weak bristles on to the end of the gill-bearing region.

Lobworm (*Arenicola piscatorum*).

Local Government is a term used, in the United Kingdom, to express the control and administration of the local affairs of separate divisions and districts of the country by subordinate authorities. It is thus contrasted with imperial government, or the control and administration of affairs for the whole country by the supreme legislative and executive authority. Prior to the Reform Act of 1832 local government in the United Kingdom was of a very rudimentary character. The management of local affairs was almost entirely in the hands of the propertied and privileged classes; the great mass of the people had little or no participation in it. As regards the counties and rural districts, the justices of the peace in England, the commissioners of supply and justices in Scotland, and the grand jury and justices in Ireland were the exclusive governing authorities; while burghal affairs were practically in the hands of close corporations, either self-elected or chosen by privileged classes of burghesses. The first step towards realising local self-government was the reform of the municipal corporations in 1832-35, whereby the town-councils were made elective. Since then the course of legislation in this direction has been one of steady progress. Thus, in settling the government of urban communities, such as the local board districts of England and the police burghs of Scotland—the legislature has given them as full control of their affairs as the returned municipal boroughs. So the establishment of the poor law systems for each of the three Kingdoms between 1835 and 1845, and the creation of poor law unions in England and Ireland, first introduced life and activity into the rural districts. The great area of local administration is, especially since the Local Government Act

of 1888, the county, and is fully treated under that head. Other important areas, separately treated, are the parish and borough, for both England and Scotland. In Ireland, besides the county and town, the union had exceptional importance; and till the Irish Local Government Act of 1898 superseded it by County Councils, the grand-jury (see JURY) had wide administrative powers. The (optional) transfer of most of the proceedings in Scottish private bill legislation to Scotland (by act of 1899) increases the autonomy of the northern kingdom.

The Local Government Board, to which in 1871 the powers of the English Poor law Board (1834) were transferred, is, in form, a committee of the Privy-council, but the work is done by the political heads of the department (the president and parliamentary secretary, both usually members of the House of Commons) and a staff of clerks. Among the matters placed under the supervision of the Board may be mentioned the areas of parishes, &c., local taxation returns, the administration of the poor-law, sanitary improvements, baths and wash-houses, vaccination, and the prevention of disease. The Local Government Board of Scotland is provided over by the Secretary for Scotland. From the nature of the case, the multiplicity of subjects included in Local Government are best treated in a large number of separate articles, some of which are noted below.

See Probyn, *Local Government and Taxation* (1882); Gouly and Smith, *Local Government in Scotland* (1880); Mackenzie Chalmers, *Local Government* ('Citizen Series,' 1874-83); *Local Government and Taxation*, by various authors, in 'Imperial Parliament Series' (1885); E. Odgers, *Local Government* (1899); also the several articles:

Advocate (Local).	Government.	Poor-laws.

Education.	Police.	Warrant.

Local Option is a term for the power which temperance reformers have of late sought to secure for the ratepaying inhabitants of any community, enabling them to regulate the liquor traffic within their bounds as to a certain majority of them shall seem best, either by maintaining unchanged, increasing, diminishing, or wholly suppressing the houses for the sale of intoxicating liquors. See LICENSING, LIQUOR LAWS, and TEMPERANCE.

Lochaber, a district in southern Inverness-shire. The Lochaber Axe is a variety of the Halbert (q.v.), with a long handle and a bill-like blade, behind which, on the other side of the shaft, is a formidable hook. This weapon was formerly used by the Highlanders of Scotland and by the native Irish, and is believed to have been introduced into both countries from Scandinavia (see Scott's *Waverley*). It was carried by the old city guard of Edinburgh. The song 'Farewell to Lochaber' is by Allan Ramsay.

Lochleven, a beautiful oval lake of Kinross-shire, 23 miles NNW. of Edinburgh. Lying 353 feet above sea-level, and eight by Benarty (1467 feet), the West Loamond (1743), and other hills, it measures 3½ miles by 2; discharges by the Leven, flowing 16 miles eastward to the Firth of Forth; is 10 to 90 feet deep; and has an area of 3496 acres, drainage operations having reduced its size by one-fourth in 1826-36. Of seven islands, the largest are sandy, treeless St Serf's Inch, an early seat of the Culdees (q.v.), and Castle Island, with the 14th-century keep of a castle which in 1567-68 was

for ten months the prison of Mary Queen of Scots. Since 1633 and earlier the loch has been famous for its delicate pink-fleshed trout, and since 1856 for its fly-fishing, there now being twenty boats on it, and some fifty annual angling competitions, whilst the yearly take has varied from 6092 trout of 5385 lb. in 1877 to 23,516 of 21,074 lb. in 1888, and 10,933 of 9201 lb. in 1890. See Robert Burns-Begg's *History of Lochleven Castle* (2d ed. Kinross, 1877). See also LIVEN (LOCH); and for Lochs Loamond, Long, &c., see LOMOND, &c.

Lochmaben, a market-town of Annandale, Dumfriesshire, 10 miles by rail NE. of Dumfries. It stands amid seven lochs, two of which contain the rare vendace, and has a town-hall (1878), with a statue in front of it of Robert Bruce, and the ruined castle of the Bruces. A royal burgh, it unites with Dumfries, &c. to return one member. Pop. 1039. See W. Graham's *Lochmaben* (1865).

Lock, an arrangement for fastening doors, drawers, &c., and requiring a key or other similar contrivance to open it. The early Egyptians used locks of rude construction, generally made of wood; and locks and keys of bronze and iron have been found in large numbers in Pompeii and Herculaneum. Fig. 1 represents the ancient Egyptian lock in section: *a* is the case, fastened to the door; *b*, the bolt; in the upper part of the case are three openings, *c*, each containing a pin with a head to prevent its falling too far down. When the bolt is pushed home towards *b*, the pins fall into the corresponding three holes, *d*, preventing its being withdrawn. The key is a piece of wood, *e*, which is pushed into the opening, *f*, in the bolt, and by means of its three pins the pins in the case are pushed up while the bolt is withdrawn. An exactly similar lock is still used in the Faroe Islands, and one very like it in St Kilda. The Chinese for many hundred years have had a much superior wooden lock with tumblers.

During the 15th, 16th, and 17th centuries very ingenious and complicated locks, richly ornamented with hammered iron work, were made, especially in Germany, and in every collection may be seen more or less fine specimens. These, however, were necessarily very expensive, and could only be used by the wealthy, and the lock in ordinary use up to the beginning of the 19th century was the common

FIG. 2.

FIG. 3.

spring-lock shown in fig. 2, and which is still used for ordinary purposes. The bolt, *a*, passes through an opening in each side of the case, and is held in position by the two notches, *bb*, which are pressed against the bottom of the opening, *c*, by the spring, *d*, as the bolt is locked or unlocked. The key, acting in the semi-circular notch, *e*, in the bolt, pushes it either to one side or the other as required; the fig. represents the bolt midway between open and locked. Certain notches in the key fitting into corresponding wards, *f*, fastened to the plate of the lock, are supposed to prevent any other

instrument but its own key from opening the lock. The first improvement on this was the common tumbler-lock (fig. 3), which represents the simplest form of it: *a* is the bolt; *b*, the tumbler, with a projection, *c*, which is pressed by the spring, *d*, into the notches, *e*, *e*, according as the lock is open or shut. The key, by the one movement, raises the tumbler and moves the bolt.

Barron's lock, patented in 1778, was a development of the tumbler principle. By putting the notches in the centre of the bolt instead of on the top edge, the pin in the tumbler had to be fitted to an exact height to pass the bolt, rendering it much more difficult to pick. Barron subsequently added a second tumbler which had also to be passed by the bolt. Barron's form of construction is still in use, and it may be considered the parent of the modern many tumbler or lever lock, of which Moses Bird's (1780) was the first.

The lock patented by Joseph Bramah in 1788, and still one of the recognised best locks for certain purposes, is of a different construction.

An inner barrel turning inside a fixed cylinder has a central pin on which the key works. The key (fig. 4) is a simple pipe with generally four slits, *a*, *a*, and a pin, *b*; when it is inserted and pressed down, the slits press on corresponding slides working in the inner barrel, till, arriving at a certain point, the barrel is released and can be turned round by the pin, *b*; another pin on the barrel moves the bolt. A spiral spring on the central pin keeps the slides in their original position till pressed down by the key. The varying depths of the slits in the key agree with the distance which the different slides have to be pressed down; and, as no two locks are alike in this respect, each key can only open its own lock. So much confidence had the Messrs Bramah in this lock that during the Great Exhibition of 1851 they offered a prize of two hundred guineas to any one picking it, which prize was gained by Mr Hobbs, an American, who occupied fourteen days in devising and making tools, and fifty-one hours not idly at work on the lock.

Fig. 5.

Chubb's lock, originally patented in 1818, is a further development of the many tumbler principle. It is shown in fig. 5, which represents it unlocked, and with the inner plate removed the better to show the movement: *a* is the bolt; *b*, the tumblers, six in this instance, which move independently on the common pin, *c*, each having one of the six springs, *d*, to keep it in position. The stump, *e*, riveted to the bolt, must

pass through the *gate*, *f*, in all the tumblers before the bolt can be shot. As this gate is in a different position in every tumbler, they must be raised to correspondingly different heights before they coincide for the stump to pass. For this purpose the key, *L*, has different steps so arranged that, when it is turned in the lock, each step raises its own tumbler to the proper height, and the step nearest the end of the key, *L*, shoots the bolt; the stump passing through the coinciding gatings and slipping into the space, *g*, as the tumblers, released by the key, resume their original position. In opening the lock the reverse of this movement takes place. A pin, *h*, fixed on the backmost tumbler and reaching over the tops of the others is called the detector. Should any false key be tried in the lock when locked, or any other means used which should raise either of the tumblers too high, an ingenious arrangement fixes it so that the lock is obstructed and cannot be opened, even with its own key, till the fixed tumbler is released. This is done by making an extra forward movement of the key, when the tumbler will resume its normal position. This detector movement is intended as a precaution against burglars, and also to record any attempt to pick the lock. False notches, *i*, *i*, are made in the tumblers to defeat attempts to pick the lock by feeling for the different gatings by backward pressure of the bolt applied by ingenious instruments—a method, difficult as it may seem, which has been successfully used against all tumbler-locks, unless specially safeguarded. A movable circular curtain attached to the keyhole in the inner plate is moved by the aftermost step of the key, *m*, as it is turned round. This prevents an inspection of the tumblers for picking purposes by means of a reflector introduced into the keyhole, while they are moved by any instrument, as nothing can be turned round in the lock without also turning the curtain.

Hobbs's protector lock has a series of tumblers as in Bird's and Chubb's locks, but, in addition, has what is termed a *protector*, shown in fig. 6. It consists of a shaped lever,

a, *b*, working on the pin, *c*, which is riveted into the bolt, *A*, and it is kept in position by the friction spring, *e*. The stump, *b*, is fixed to the protector, and, passing through a hole in the bolt, acts on the tumblers (not seen in the fig.) at the other side

Fig. 6.

of the bolt. This arrangement entirely prevents feeling for the gatings of the tumblers by pressing back the bolt. If any attempt is made to push back the bolt when locked, it only moves the protector enough to bring down the long arm, *a*, in front of the pin, *d* (fixed in the back plate of the lock), as shown in the fig. This prevents any further movement of the bolt till the protector is set free by a slight turn of the proper key. This lock, when in combination with another ingenious arrangement called the *preventing notch*, which prevents tampering with false keys, has successfully resisted all attempts to pick it.

Lord Grimthorpe (formerly Beckett Denison) invented a modification of the tumbler lock which locks with a handle, only requiring a small key to open it. The keyhole is so narrow that no instrument strong enough to impair the lock can be introduced. It has other advantages, and its inventor claims that it is unpickable. It has not been patented. He is also the inventor of a dust-excluder for the key-holes of locks, operated by a spiral spring.

Many other varieties of the tumbler or lever

lock have been invented which we have not space to describe.

Combination locks are sometimes used for burglar-proof safes. In these locks the tumblers are represented by wheels, generally four in number, which can be turned independently in connection with an index on the outside of the safe. The lock can only be opened by making certain movements of the handle on the index, which cause the gatings in the wheels to coincide. The combination of numbers on the index with the different wheels can be altered at pleasure, and, of course, the lock can only be opened by those knowing this combination. The weak point of this lock is that the combination may be forgotten. The Yale time-lock is an improvement, by Mr Yale of Philadelphia, on the time-lock invented by Rutherford of Jedburgh, Scotland, in 1831. A watch in combination with the lock may be set so that the lock can only be opened at a particular hour even by the owner.

Changeable key locks were first introduced into England by Mr Hobbs, who brought Day and Newell's *parantoptic* lock to London in 1851. After many improvements, Mr Hobbs perfected this lock in 1862, and in 1865 the firm of Hobbs, Hart, & Co. introduced a simpler and cheaper form of it. By an ingenious modification of the tumblers, which we have not space to describe, the lock may be locked by any one of a great number of keys, but can only be opened by means of the one which locked it. Some of these locks afford a possible choice from about 60,000,000 keys, any one of which will lock it, and which must be used to open it again. To avoid the necessity of having a number of keys, different webs are supplied which fit on the key pipe to form the key. The webs may be kept in the safe, one taken out at random to lock up with; the web removed from the key carried away in the waist-coat pocket, and the key hung up anywhere, useless till the web is brought back.

In the ordinary safe locks the bolts are necessarily on a large scale, and, to prevent the carrying about of a key of corresponding magnitude, the bolts are usually shut by means of a handle, and a small lock with a small key locks one of them and fastens them all.

Latch locks used on street doors which shut of themselves, and are opened by means of a handle

Fig. 7.

d is a movable barrel turning inside the lock; 1, 2, 3, 4, 5 are five pins pressed down by spiral springs working in holes in the fixed part; *e, f, g, h, i* are five corresponding pins, moving in holes in the inside barrel; they are of irregular lengths, and when the key is out, *e, f, g, h, i* drop down, as shown by the dotted lines, allowing 1, 2, 3, 4, 5 to drop into the holes in the barrel, fixing the lock. As the key, which has indentations exactly corresponding with the varying lengths of *e, f, g, h, i*, is pushed in, it raises those pins till they and 1, 2, 3, 4, 5 coincide at the junction of the barrel and the fixed part of the lock. The barrel may then be turned and a pin on

it shoots the bolt, not shown in the fig. The key is a thin piece of tempered steel weighing only a small fraction of an ounce, and the keyhole correspondingly narrow.

Locks made for various purposes, such as doors, drawers, writing-desks, portfolios, enboards, &c., however differing in arrangement, are all constructed on the same principle. The *pulllock*, in which the lock is a separate arrangement, is precisely similar to other locks except in shape. It has also a movable bow which is hooked into a staple or other fastening and then locked.

Locks for drawers, enboards, and the like, which only require to be opened on one side, are generally made with a central pin on which the key, with a pipe, works; but in locks which must be opened from both sides this arrangement is impossible, and the key is solid, working through a hole in the lock. It must, however, be symmetrical, so as to exactly reach the turning place of the lock from either side. Locks which are mortised into the thickness of the door are called mortise locks.

Many ingenious automatic latches have been invented for cabinets and the like, which shut of themselves when the door is closed, and can be pulled open without a key or turning a handle; they are used when security is not required, only a means of keeping the door closed.

See Price's *Treatise on Locks and Keys* (1856); Sir E. Beckett (Denison), *Treatise on Locks*; Hobbs and Tomlinson, *Treatise on the Construction of Locks* (new ed. 1868); and G. H. Chubb, *Protection from Fire and Theft* (1878).

Lock, on a river or canal, is an arrangement of two parallel floodgates, by which communication is secured between two reaches of different levels. Without locks, canals are an impossibility in any but exceptionally level country. The principle of locks is explained in the article CANAL, Vol. II. p. 697. The invention of the lock has been claimed for the great Leonardo da Vinci or other Italian engineer of the 15th century; but there seems ground for affirming that the principle was known and used in Holland a hundred years earlier.

Lock of a gun. See GUN, FIREARMS, and BREACH-LOADING.

Locke, JOHN, one of the most conspicuous figures in the intellectual history of modern Europe, in whom, directly or indirectly, the course of opinion, especially in the 18th century, is probably more represented than by any other man. Locke was a native of Somerset; Belton, the rural home of his youth, is 6 miles from Bristol. It was at Wrington, 10 miles from Belton, that he was born, on the 29th of August 1632. Our picture of his boyhood is faint. He lost his pious mother when he was a child. His father, a country attorney, was a considerable factor in the formation of his mind, during fourteen years of home-training in the small Puritan household, which consisted of the father and an only brother, who died young. In Locke's tenth year the Civil War broke out. He was at Westminster School in the years in which the assembly of Puritan divines was discussing Calvinistic theology, and in one of which he may have seen the tragedy at Whitehall in which the Puritan revolution culminated. In 1652 we find Locke at Oxford, after which the picture becomes more distinct. Christ Church was then ruled by John Owen, the Puritan divine, and Cromwell was chancellor of the university. The Aristotle of the schoolmen still determined the course of study, much to the dissatisfaction of young Locke, who preferred facts to words, and persons to books. But free experiential inquiry

was finding its way into Oxford, though not into college lectures, and Locke afterwards confessed the early influence of the spirit of Descartes upon himself. The Restoration found him in 1660 a senior student in Christ Church. For a time he lectured as a college tutor, till the little property of Belton became his by inheritance after the death of his father in 1661. He had now to determine his career. Notwithstanding an inclination to theology, his growing sympathy with free inquiry, in reaction against scholasticism, and against the intolerance and fanaticism of which he complained among the Puritans, discouraged an ecclesiastical career. 'I found,' he says sarcastically, 'that a general freedom is but a general bondage, and that the popular assertions of liberty are the greatest engrossers of it too, and not unjustly called its keepers.' Experiments in medicine, which much engaged him in these years, show his bent to the inductive interpretation of external nature, and aversion to the 'vermicate' questions of the schools. Before 1666 he was in a sort of amateur practice in Oxford, and, although he never took this degree, he was in after-life familiarly known among his friends as 'Doctor Locke.' The philosophic temperament is apt to make a merely professional career irksome; and, besides, he inherited a delicacy unfavourable to medical practice, which ended in the chronic consumption and asthma against which he bravely struggled in later years. Thus medicine did not absorb his attention. Problems of society, the relations of church and state, and above all the right and duty of religious toleration, as his commonplace books prove, were revolved in his thoughts in those Oxford years, always in sympathy with individual freedom and in a spirit of prudential utilitarianism.

It was in the summer after his return from Germany, where he had spent the winter of 1665, that an incident occurred which finally determined this last disposition, for thenceforward he was 'often a man of business, and always a man of the world, without much undisturbed leisure.' Medical practice accidentally brought him into connection with Lord Ashley, soon after first Earl of Shaftesbury, who was visiting Oxford for his health. The meeting ended in a lasting friendship, sustained by common interest in liberty; and in the following year Locke, at Exeter House, became Lord Ashley's confidential secretary. The change did not check his scientific experiments, in which he was encouraged by Sydenham and other savants with whom life in London opened intercourse, while the political experience of Exeter House was in the line of previous interests. It was not long after he entered it that the turning point in his intellectual career was reached. A remission of friends, meeting in the winter of 1670-71 for the discussion of problems social and theological, perplexed in certain inquiries, welcomed Locke's suggestion, that before pursuing them they should face a previous investigation—as to what questions the human understanding was or was not fitted to deal with. This problem, then undertaken by Locke himself, proved unexpectedly large. His best energies, given to it during the seventeen following years, issued in 1690 in the famous *Essay Concerning Human Understanding*.

Those seventeen years were spent partly in England, amidst the tumult of public affairs, partly on the Continent in comparative retirement. In 1672, when Shaftesbury became chancellor, Locke was made Secretary to the Board of Trade. The fall of Shaftesbury three years later enabled his secretary to retire to France, where he lived till 1679, for health and study, chiefly at Montpellier and at Paris. In France he

formed friendships with physicians, naturalists, and travellers more than with metaphysicians; although it was the brilliant era when French metaphysic was represented by Arnauld and Malebranche, whilst Spinoza was (till 1677) in Holland and Leibnitz in Germany. In 1679 Locke returned to London and to Shaftesbury, who was restored to power for a short time, and lived with him in the years of plots and counterplots which preceded the earl's flight to Holland in November 1682. Locke, under suspicion in England, as the confidant of Shaftesbury, became before the end of 1683 an exile in Holland, then the European home of religious and civil liberty. There, during five years of exile, he resumed the studies which affairs in England had often interrupted, and matured voluminous writings for the press. At Amsterdam Limborch, the leader of liberal theology in Holland, and Le Clerc, its most eminent man of letters, became his intimate friends. The intercourse strengthened Locke's theological liberalism, and soothed the pains of exile, aggravated by the withdrawal of his senior studentship in Christ Church, of which he was suddenly deprived in 1684 by the king's command. His first home in Holland was at Amsterdam—his last was at Rotterdam, where the *Essay* was finished.

The political struggle which had been going on for half a century in England was consummated by the Revolution of 1688-89, of which, then unknown to fame, he was to be the philosophical defender. This opened the way for his return, to play his part in authorship, with London at first as the stage of operations. Immediately afterwards, in February 1689, he declined, for health's sake, the post of ambassador at Brandenburg, contented with a modest Commissionership of Appeals as official recognition by the new government. The course of affairs after the Revolution fell short of his hopes. The Toleration Act of 1690 was inadequate, and the withdrawal of the Comprehension Bill, for uniting England in a liberal national church, was another disappointment. Locke made his first appearance as an author late in life. He turned to authorship in the public interest of individual freedom—religious, political, and intellectual. An *Epistola de Tolerantia* was his first contribution, written in 1685, addressed to his Dutch friend Limborch, published anonymously at Gonda in Holland in 1689, a few weeks after his return to England, and translated into English in the following summer by William Popple. A treatise on *Civil Government*, ready for publication when he came home, followed early in 1690; this was also anonymous, and, like the *Epistola*, a defence of individual liberty in another relation. Its economical principles anticipate Hume and Adam Smith, and its principles of jurisprudence are in advance of Grotius and Puffendorf. The *Essay Concerning Human Understanding* appeared in March 1690, unfolding the philosophy of which the treatises on Toleration and on Government were special applications. The *Essay* was Locke's first public acknowledgment of authorship. His philosophy is embodied in these three works.

His ailments had increased in London. It was then, in 1691, that the home of his old age, the brightest of all his homes, opened to receive him. This was the manor house of Oates in Essex, near Epping, the country seat of Sir Francis Masham. Lady Masham was the accomplished daughter of Cudworth (q.v.), the philosophical theologian; Locke had known her family before he went to Holland. Here, for the fourteen remaining years of his life, he enjoyed as much domestic peace, literary leisure, and social intercourse as was consistent with broken health and occasional public

service in London, and his work in the study was resumed with characteristic industry and method. The abundant authorship of the two preceding years now involved him in controversies which lasted to the end of his life. The *Answer* of a certain Jonas Proast of Queen's College, Oxford, to the *Epistola de Tolerantia* had led to Locke's *Second Letter* in 1690. A rejoinder in 1691 was followed by an elaborate *Third Letter* in 1692. Questions of economics and the currency were subjects of other tracts in 1691 and 1695. When he was in Holland he had corresponded with his friend Edward Clarke of Chipley in Somerset about the education of his son, and those letters made the substance of the *Thoughts on Education* in 1693, a characteristic work which still holds its place among educational classics. Proposals for ecclesiastical comprehension, and his own desire for union among Christians, made him anxious to show how few and simple the essential facts of Christianity were, and to bring men to agree to differ about all beyond. One result was the anonymous volume, in 1695, on the *Reasonableness of Christianity*, in which he tried, in the spirit of the *Essay*, to recall Christianity from the verbal reasonings of dogmatic divines, which had disturbed the unity of the church, to its original simplicity in Scripture. This theological departure, followed by excursions in criticism in the last years of his life, which appeared as posthumous *Commentaries on St Paul's Epistles*, was a distinctive feature of the literary life at Oates. In 1696, as a Commissioner of the Board of Trade, with an income of £1000 a year, he was again involved for the four following years in official cares. But they were not years of literary idleness. Successive editions of the *Essay*, in 1694, 1695, and 1700, with important additional chapters in the first and last; defence of its philosophy against the adverse criticism of Norris, Stillingfleet, Sergeant, Burnet, Lee, and Leibnitz; an *Examination* of Malebranche, and *Remarks* on Norris, published posthumously; vindications of the *Reasonableness of Christianity* against theological critics; and the well-known tractate on the *Conduct of the Understanding*, kept him busy in the study at Oates. The *Essay*, translated into Latin and French, was spreading over Europe. But he was now gathering himself for the end. In 1700 he ceased to publish. One attack only moved him in the four years which followed. In 1704 his old adversary Proast renewed the contest, and the fragment of a *Fourth Letter on Toleration*, published in the posthumous volume, exhausted Locke's remaining strength upon the theme that had engaged him at Oxford forty years before, and had been the ruling idea ever since. All that summer he declined, nursed by Lady Masham and her step-daughter Esther. On the 28th October 1704 he passed away, as he said, 'in perfect charity with all men, and in sincere communion with the church of Christ by whatever names Christ's followers call themselves.' His tomb may be seen on the south side of the parish church of High Laver, a mile from Oates, bearing a Latin inscription prepared by his own hand.

Locke's *Essay* presents the philosophical foundation of the right of the individual thinker to follow freely the findings of experience; and, partly even by its metaphysical defects, it has suggested the chief problems which have occupied modern thinkers since it appeared. Its 'design,' according to its own words, was, 'to inquire into the original, certainty, and extent of human knowledge, together with the grounds and degrees of belief, opinion, and assent;—and this as a means to correct the chief cause of human error, which its author found in men's proneness to ex-

tend their inquiries to matters beyond their reach, and then to cover their ignorance by empty phrases, or by dogmas which they assumed to be 'innate,' and therefore out of the reach of criticism. He wanted to make a faithful report, founded simply upon mental facts, as to how far a merely human understanding can go, in the way either of certain knowledge or of more or less probable presumption; and in what man must be contented with ignorance. Although a true report might show that human knowledge must for ever 'fall far short of perfect comprehension of whatsoever is,' it might be 'sufficient for our state;' and at anyrate we cannot overcome facts.

The *Essay* is divided into four books. Only the fourth deals directly with its 'design.' The first book is a preliminary argument against the innateness of any part of our knowledge, meant to open the way for the statement of Locke's main position—that whatever any man can know, or reasonably believe in, or even conceive, is dependent on human experience. The essence of the *Essay* is in its proof that knowledge cannot in any degree have been consciously innate in each man; for it must be in all cases a gradual growth, dependent upon experience, in which we are liable to error. The argument might be thus put: All truths and all errors are expressed in propositions, and every proposition contains two terms, which, if the proposition is intelligible, must each contain an 'idea' or meaning. We may have ideas without having knowledge, but we cannot have knowledge, or even opinion, without having ideas; for 'having ideas, Locke tells us, means 'speaking intelligibly.' Propositions which contain *ideal* terms cannot express truth, or even error, and only connect empty sounds. Now, how do the ideas or meanings which *can* form the subjects and predicates of our propositions enter into human consciousness? All our ideas, the most complex and abstract, as well as the simplest, Locke undertakes to show, are ideas which refer either to data that happen to have been presented through our five senses, or to operations of mind which have been made objects of reflection. If we pretend in words to extend our range further, 'we shall succeed no better than if we went about to clear the darkness in the mind of one born blind, talking into him the ideas of light and colours.' Words which do not mean either what is sensuous or what is mental must be empty words. The proof of this fundamental thesis is offered throughout the second and third books, which thus prepare for the settlement of the proper problems of the *Essay* in the fourth. Much of the proof consists of logical and psychological analysis of the metaphysical ideas of space, duration, infinity, substance, personality, causality, and power, which are taken as 'crucial instances.' If even those ideas must depend upon experience in order to become ideas, *a fortiori* none others can have been consciously born with us before we had experience. The proof is that, if all elements due to experience are left out, the ideas now mentioned must disappear. In the 13th and most of the remaining chapters of the second book this argument is worked out. But here Locke seems too ready to take for granted that, if those crucial ideas are unrealisable without data of experience, it necessarily follows that they involve nothing else than accidents of external or spiritual experience. He was led to interpret 'innateness' as he did partly by his assumption that nothing can be '*in* a mind' of which the mind is not at the moment conscious. He thus overlooks the fact that we are conscious at each moment only of a small part of what—because potentially involved in, and presupposed by, our spiritual experience of the

universe—responds consciously in each man's mind on an adequate appeal.

After this analysis of the possible range of man's ideas, Locke passes to the intuitive and demonstrable, the probable, and the erroneous judgments into which ideas enter. We are thus led into the fourth book, which reports upon the intuitive facts and principles which constitute knowledge. Locke's refusal of immateness (in his meaning of 'innate') to ideas, and *a priori* to knowledge which depends upon ideas, does not imply that he ignores intuition. On the contrary, after arguing strenuously against the immateness of our ideas of morality and of God, he is not less strenuous in arguing for our having an intuitive certainty of the truths of pure mathematics and abstract ethics, and for our being intuitively certain of the individual fact of our own existence as self-conscious, as well as of the existence of external things, as far as they are actually felt, and above all for our having a demonstrable knowledge of the existence of God or Eternal Mind 'as certain as any conclusion in pure mathematics.' Indeed, in his 'demonstration' of God's existence he presupposes in our idea of causality transcendental elements with which his description of that idea in the second book can hardly be reconciled. On the whole, we have intuitive knowledge (so Locke reports) in abstract logic, in abstract mathematics, and in abstract ethics; and we have also an intuitive knowledge of the facts of our own existence, of the existence of actually felt things of sense, and of the existence of an Eternal Spirit: it is on the light of intuition, he says, 'that all the certainty of this knowledge depends.' But all else upon which human understanding can be exercised is referred by the *Essay* to the spheres either of more or less probable presumption or of ignorance. All judgments about absent things of sense; about the relations among the qualities of matter, primary and secondary, or about its laws; and about the attributes of spirits human or divine, can at the most be probable presumptions. Hence probability is virtually the guide of human life. Science of absent facts of sense (if science means intuitively demonstrated truths) is beyond man's reach. The chief exercise of a human understanding must be balancing of probabilities and comparing the relative weight of objections, alike in the so-called physical sciences and in common life. Whether physical science, or even the probable propositions of ordinary life, could be formed without the latent presence in experience of universal and necessary judgments, presupposed in, while incapable of being referred to, its contingencies, Locke does not inquire. His aversion to presuppositions and maxims, to which he traced the empty verbalism and dogma against which he constantly warned, seems here to influence him. He sometimes wrote as if he failed to see that, without presuppositions and principles of some sort, intellectual and moral, being ready to spring out of their latency into experience, there could be neither reasoned scepticism nor reasonable faith. The most significant philosophical discussions of the last two centuries have been about the presence or absence of transcendental presuppositions and principles in our experience; and about man's consequent relation to the infinite and the eternal. Berkeley's *Principles of Human Knowledge*, Hume's *Inquiry* into the understanding, Reid's *Inquiry* into the principles of common sense, Kant's *Kritik of Pure Reason*, Hegel's ontological dialectic, Comte's positivism, and Herbert Spencer's generalisations of universal evolution and involution, are all in their respective ways concerned with questions about the roots of experience which Locke left indeterminate. Locke's teaching in his other works is influ-

enced by what is taught in his *Essay*. Thus, his favourite idea of free toleration for the individual expression of religious belief—then a paradox, now a commonplace—is founded on the dependence of man's knowledge on experience and on the unfitness of persecution as a means of introducing truth to a human mind; while his refusal of toleration to atheists is in harmony with that 'mathematical certainty of God's existence' which he reports to be attainable by every man who uses his faculties enough. The same intellectual individualism pervades what he wrote about government, the education of the young, and the reasonableness of Christianity.

Locke's character is reflected in his works. In all that he wrote and did he is pre-eminently himself, in his caution and calculation with an approach to timidity, steady adherence to the concrete of experience, indifference to abstract speculation, suspicion of mystical enthusiasm, calm reasonableness, love for truth, and ready submission to facts even when they could not be reduced to system in a human understanding. His temperate aim was not to explain the universe, but to adapt his own intellectual life and that of others to the actual conditions. He sought to awaken the intellectual spirit, and to bring about an amendment of the operations of the understanding, more than to solve the enigmas of existence. Hence the lasting educational value of his authorship.

Numerous editions of Locke's works, individually and collectively, have appeared, about 40 of the *Essay* alone, besides translations into Latin, French, and German. Of the collected editions none are adequate, but the best is probably that of Bishop Law in 4 quartos (1777). Among criticisms of the *Essay*, the *Nouvaine Essais de Leibnitz* (1765) still takes the foremost place. Cousin's *Lectures on Locke* (1829), Webb's *Intellectualism of Locke* (1857), and Green's criticism in his Introduction to Hume (1874) are noteworthy. See also Fowler's *Locke* ('English Men of Letters,' 1880), and the present writer's *Locke* (1890), and his critical edition of the *Essay* (2 vols. 1894).

Lockerbie, a market town, with a great August lamb-fair, in Annandale, Dumfriesshire, 15 miles ENE. of Dumfries and 26 NW. of Carlisle. Pop. 2391.

Locker-Lampson, FREDERICK, son of a naval officer, was born in 1821, served some years as précis writer in the Admiralty office, and made his name widely known as a writer of unusually bright and clever *vers de société*, by his *London Lucies* (1857), collected from the various papers in which they had appeared. Later books are *Late Elizabethan* (1867) and *Parliament* (1879). In 1859 he married a daughter of the seventh Earl of Elgin, who died in 1872; and in 1874 the daughter of Sir Curtis Lampson, when Locker added the name of Lampson to his own. In 1878 his daughter was married to Lionel Tennyson. He died 30th May 1895. See *My Confessions* (1896), which is an autobiography.

Lockhart, JOHN GIBSON, was born in Cambusnethan manse, near Wishaw, 14th July 1794. All his boyhood was spent in Glasgow, where at eleven he passed from the high school to the college, and whence at thirteen, with a Balliol Snell exhibition, he went up to Oxford. In 1813 he took a first class in classics; then, after a visit to the Continent (to Goethe at Weimar), studied law at Edinburgh, and in 1816 was called to the Scottish bar. But he was no speaker; and having while still at Oxford written the article 'Heraldry' for the *Edinburgh Encyclopædia*, and soon after translated Schlegel's *Lectures on the History of Literature*, from 1817 he took more and more to literature, and with Wilson became the chief mainstay of *Baldwin's Magazine*. In its pages he first exhibited the sharp and caustic

wit, his most salient characteristic, that made him the terror of his Whig opponents. *Peter's Letters to his Kinsfolk* (2d ed., 1819), a clever skit on Scottish society, was followed by four novels - *Valerius* (1821), a romance of the times of Trajan; *Adam Blair* (1822); *Reginald Dalton* (1823), a tale of university life; and *Matthew Wald* (1824). Of these *Adam Blair* alone retains its vitality - the strong, sad story of a good man's fall and repentance; Henry James has likened it to Hawthorne's *Scarlet Letter*. The spirited *Ancient Spanish Ballads* appeared in 1823; *Lives of Burns and Napoleon* in 1828 and 1829; and the *Life of Scott*, Lockhart's masterpiece, in 1837-38. He had met Scott first in May 1818, in April 1820 had married his eldest daughter, Sophia, and for five and a half years had divided his time pretty equally between Edinburgh and Chiefswold, near Abbot-ford. In 1825 he removed to London to assume the editorship of the *Quarterly Review*, at a salary of £1 00 per annum; and this post he retained till 1833, in 1843 becoming also auditor of the duchy of Cornwall, a sinecure worth £400 a year. But his closing years were clouded by illness and deep depression; by the secession to Rome of his only daughter, with her husband, Mr Hope-Scott (q.v.); and by the loss of his wife in 1837, of his two boys in 1831 and 1833. The elder of them was the 'Hugh Littlejohn' of Scott's *Tales of a Grandfather*; the younger, Walter, was a scapegrace in the army. Like Scott, Lockhart visited Italy in search of health; like Scott, he came back to Abbot-ford to die - 25th November 1854. He is buried in Dryburgh at Sir Walter's feet. See his *Life and Letters*, by Andrew Lang (1896).

Lock Haven, capital of Clinton county, Pennsylvania, is situated in a beautiful mountain valley, on the south bank of the West Branch of the Susquehanna River (here crossed by a bridge), and on the West Branch Canal, 69 miles N.E. of Altoona by rail. It contains a state normal school, large foundries and tanneries, machine-shops and mills, and has an active trade in lumber. Pop. 7345.

Lock Hospital, in London, for female contagious diseases, was founded in 1746, the chapel in 1764, and the asylum in 1787. The Loke or Lock, in Southwark, from which it derives its name, was an ancient leazar-house, and was itself perhaps so-called from Fr. *loquet*, 'rags' or 'lint.'

Lock-jaw. See TETANUS.

Lockport, capital of Niagara county, New York, on the Erie Canal, 25 miles N.N.E. of Buffalo by rail. The canal here passes through a deep channel, several miles long, cut in the solid limestone, and falls 66 feet, by ten combined double-locks. Its surplus water drives a number of lumber, flour, and woollen and cotton mills, besides other factories, foundries, machine-shops, &c. Pop. (1880) 13,522; (1890) 16,038.

Lockyer, SIR JOSEPH NORMAN, K.C.B. (since 1897), was born at Rugby on 17th May 1836, and in 1857 became a clerk in the War Office, being subsequently transferred to the Science and Art Department. In 1869 he was elected an F.R.S., and in 1870 was appointed secretary to the Royal Commission on Scientific Instruction, made lecturer on Astronomy at the Normal School of Science at South Kensington, and sent out to Sicily as head of the eclipse-expedition. In the following year he headed a similar expedition to India and was elected Rede lecturer at Cambridge. He had already in 1866 discovered a new method of observing the sun; and in 1874 he gained the Rumford medal of the Royal Society, and was appointed editor of *Nature*. He is an able popular lecturer on astronomical physics, and has written *Elementary Lessons in*

Astronomy (1868), *Studies in Spectrum Analysis* (1878), *Contributions to Solar Physics* (1873), *The Spectroscope and its Applications* (1873), a primer on *Astronomy* (1875), *Star-Gazing* (1878), and *Chemistry of the Sun* (1887). In 1888 he was Bakerian lecturer.

Loche, a Swiss town, 10 miles N.W. of Neuchâtel, is one of the chief seats of the Swiss watch-making industry. Pop. 10,464.

Locomotion. See FLYING, HORSE, &c.

Locomotives. See STEAM ENGINE and RAILWAY.

Locomotor Ataxia, or TABES DORSALIS, is a remarkable disease of the nervous system, the most characteristic symptom of which is a want of power of co-ordinating the muscles. The lower limbs are almost always first and most severely affected, and the patient walks with a peculiar gait; he lifts the feet high and brings them down with a stamp; he has difficulty in balancing himself; and though he may be able to walk pretty well in a straight line on level ground, any more complicated movement (turning round, surmounting or avoiding obstacles, &c.) much increases his unsteadiness. When deprived of the aid of sight (in the dark, or on closing the eyes) these difficulties are much aggravated. In the great majority of cases sensation is early affected; and he may complain that he always feels as if he were walking upon a thick carpet. The power of the muscles is in many cases quite unimpaired.

Besides the symptoms of incoordination, and often long preceding them, are others, some of which are so characteristic that they may lead to the recognition of the disease. Severe shooting pains, especially in the lower limbs (called *lightning pains*), are frequent. Similar pains in the region of the stomach, associated with vomiting, faintness, &c. (*gastric crises*); paralysis, often transient, of one of the eye-muscles; extreme contraction of the pupil; atrophy of the optic nerve; a peculiar form of inflammation of one or more joints, are all met with in a certain proportion of cases.

The progress of the disease is always slow and uncertain; it may generally be measured by years, often by decades; but, although in some cases the condition of the patient may remain stationary for years, it generally becomes gradually worse. Death usually results from some intercurrent disease. Locomotor ataxia generally begins between the ages of thirty and fifty, and is much more common in the male sex. It seems sometimes traceable to severe acute illness, to chill, over-fatigue, injury, &c., and many of those who suffer from it have previously had syphilis; but in a large number of cases no cause is discoverable.

After death a fibrous degeneration (sclerosis) of the whole or part of the posterior columns of the spinal cord is found. The extremely uncertain course of the disease renders it very difficult to be certain of the effect of treatment, though many different methods have been advocated, and asserted to produce amendment if not cure. The most hopeful cases are those which follow syphilis; for in them a prolonged anti-syphilitic treatment not unfrequently seems to lead to great improvement or even disappearance of the symptoms.

Locri, a people of ancient Greece, divided into two distinct tribes, differing in customs and civilisation. The one, known as Locri Epicnemidii and Opuntii, dwelt on the mainland over against the island of Eubœa, whilst the other, called Locri Ozolæ, lived on the northern shore of the Gulf of Corinth. The chief town of the eastern Locri was Opus, of the western Amphissa. A colony from one or the other of these tribes founded *circa* 710 B.C. in South Italy the celebrated city of Locri,

which stood near the southern extremity of the Britian peninsula. Loeri was generally in opposition to Rome, first as the ally of the Syracusans, then of the Carthaginians. Excavations were carried out here in 1889-90.

Locus, in Geometry, denotes the line or surface traversed by a point which is constrained to move in accordance with certain determinate conditions. Thus, the locus of a point which must always preserve the same uniform distance from a fixed point is the surface of a sphere; but if the motion be at the same time confined to a plane, the locus then will be a circle; this is an illustration of the division into *solid* and *plane* loci which prevailed among the ancients. In modern Geometry plane loci are treated under the name of Curves (q.v.).

Locust, a name applied to the members of a family (Acrididae) of orthopteron insects nearly related to grasshoppers. It is unfortunate that the family Locustidae and the genus *Locusta* do not include what are usually called locusts, but the related grasshoppers, katydids, &c. Locusts in the popular sense, members of the family Acrididae, are large, ground-loving insects, of world-wide distribution, famous for their voracious vegetarian appetite. In size they vary from $\frac{1}{4}$ inch to 5 inches in length. They have strong hind-legs with great leaping powers, large heads with formidable mouth-organs, shorter antennae and robuster bodies than grasshoppers. Both winged and wingless forms occur, the former with strong powers of flight, though they are doubtless aided in traversing seas and continents by the prevailing winds. The females have strong ovipositors by which they bore holes for their eggs; the males are without the grasshoppers' stridulating organ at the base of the wings, but rub their thighs against the edges of the wing covers. The numerous eggs are hid in holes drilled in the ground; the young develop with incomplete metamorphosis, and when hatched generally resemble the parents except in the absence of wings. From the first they are gregarious, and excessively voracious except during their repeated moults; they devour all green things, and even one another, and are often forced by stress of hunger and excessive multiplication to migrate in great swarms, 'which have been traced over a stretch of country many hundreds of miles in length.' They periodically appear in destructive hordes, 'thick as snow-flakes,' darkening the sky in 'myriads numberless, the rushing of whose wings is as the sound of a broad river.' Their ceaselessly moving jaws make a noise comparable to a spreading flame or to 'chaufours in battle;' in a few hours cornfields are reduced to bare stalks or stubble; 'the land is as the garden of Eden before them, and behind them a desolate wilderness.' The prophet Joel's description is at once vivid and accurate. Their ravages sometimes cause widespread famine and ruin; their rotting corpses produce pestilential effluvia. In many countries they are eaten, roasted or fried in butter, preserved in brine, plain boiled, or dried in the sun. 'In taste the red locust, which is the female, resembles green wheat, having a very delicate vegetable flavour.' One of the most famous and destructive forms is the Rocky Mountain Locust, *Calyptenus spectus*; the most abundant migratory species of the East, so often mentioned in the Scriptures, is *Pachytelus maculicornis*, Acridium, Oedipoda, Stenobothrus are among the

numerous other genera of importance. See GRASS-HOPPLER; and for a complete account of the Rocky Mountain Locust, see C. V. RILEY in Reports of United States Entomological Commission (Washington, 1877-87). For the 'seventeen years' locust or harvest fly of North America, see CICADA.

Locust Destruction. Numerous systems both in the Old and the New World have been adopted for destroying these terrible swarms. They were beaten down as they flew; they were pushed into bags as they crawled, and their eggs were collected and burned on a very large scale before the young were hatched. A bounty has been offered for their destruction, in Minnesota, for instance, so much a bushel being paid, and thousands of bushels brought in. But no method was of any practical avail, until in Cyprus, under British administration, a system was perfected which has been so completely successful that it may be said to be the only one worthy of notice or consideration. It was suggested as early as 1870 by an enterprising land owner in Cyprus, Mr Richard Mattei, and was modified and perfected by Mr Samuel Brown,

Locust *Pachytelus maculicornis*

government engineer-in-chief in the island in 1881. Mr Mattei was created a C.M.G. in 1886.

By his system, based upon a close observation of the nature and habits of the insects during many years, the locusts are caught while they are 'on the march'—that is to say, while (some ten days after they are hatched) they march across the country in countless hosts or 'armies.' Mr Mattei, having observed that no obstacle causes them to turn back in their onward progress, but that they climb and crawl over everything that bars their direct course, and that furthermore they are unable to obtain foothold on any perfectly smooth or polished surface, hit upon the ingenious expedient of barring their progress by means of long canvas screens put up on stakes and furnished at the top with a band of varnished leather or what is called American cloth. Deep pits are dug at intervals of some few yards on the side of these screens facing the advancing hosts, and the locusts, reaching the obstacle and being unable to surmount it owing to the polished surface on the upper edge, fall down and are caught in the pits, which are themselves edged and lined to a depth of a few inches with polished zinc. Finally, the locusts as they fall into the pits are rendered ineffectual by crawling out, not only by the smooth surface of the zinc, but by the superincumbent weight of the tens of thousands of fresh victims that are perpetually piling in upon them. By this system the locusts in Cyprus were in five years entirely destroyed, and at a cost, though large for Cyprus, certainly not excessive, amounting to less than £13,000 a year. But the magnitude of the operations conducted for this comparatively moderate sum of money may be gathered from the statement that there were employed over half a million yards of canvas-screen, and thirteen thousand zinc traps, with stakes, tools, and tents for the men engaged,

in proportion. Locusts were trapped (in 1883) in about 26,000 pits, and a far larger number of holes were actually dug; while a special staff of no less than 2621 persons was employed during the campaign. Nor was the destruction on a scale incommensurate with these immense preparations. The number of the slain in 1883 is estimated, after careful calculation by Mr. Brown, as being nearly 200,000,000,000, with an expenditure of only £12,300. And in the following year the enemy still remained sufficiently numerous to supply a list of casualties numbering over 56,000,000,000 locusts. Taking these numbers together at, say, 250,000,000,000 for the two years 1883 and 1884, and the expenditure during the same period at £27,500, we find the cost of slaying locusts has been 2s. a million, which is perhaps as economical a slaughter of living creatures as is recorded in the history of nature or art. Locust destruction on this system was only commenced in 1881, and in 1886 there were few if any locusts in Cyprus left to be destroyed. See the *National Review* for March 1888.

Locust-tree, a name given in different parts of the world to different trees of the natural order Leguminosæ. The Carob tree (*Ceratonia siliqua*) is often so called in the countries bordering on the Mediterranean, and its pods are the locust-beans of our shops (see CAROB). The Locust tree of America (*Robinia pseudo-acacia*), also called the False Acacia, or Thorn-acacia, and on the continent of Europe and in Britain very generally the Acacia, is a valuable and extremely beautiful tree (see ROBINIA). The wood, known as *Locust-wood*, is useful for all purposes in which great strength, and especially toughness, is required; 'locust,' indeed, is the slang term in the United States for a policeman's baton. The Honey Locust-tree (q.v.) of America is a *Gleditsia*. The Locust-tree of the West Indies is *Hymenocaulis caribæol*, a gigantic tree whose pods also supply a nutritious matter, a mealy substance in which the pods are embedded. The bark of the tree is antiseptic; it yields a kind of resin called Anime (q.v.), and it is valuable as a timber tree, the timber (also known as *Locust-wood*) being close-grained and tough.

Lode, a miner's term for Veins (q.v.) in which minerals occur. See ORE-DEPOSITS.

Lodestar (lit. 'way-star,' or star that shows the course), an old name for the Pole-star (q.v.).

Lodestone. See LOADSTONE, MAGNETISM.

Lodève (anc. *Lutecæ*), a town in the French department of Hérault, at the foot of the Cevennes, 43 miles by rail N.W. of Montpellier. A bishop's see till 1790, it has a cathedral, founded in 950, but rebuilt in the 14th century. Cardinal Fleury was a native. Pop. 9225.

Lodge, EDMUND (1756-1839), successively Lancaster, Norwy, and Clarenceux herald, published *Illustrations of British History* (3 vols. 1791), a *Life of Julius Cæsar* (1810), and an annual *Portrait*; but is best known as author of the *Portraits of Illustrious Personages of Great Britain* (4 vols. fol. 1821-34), the cost of engraving and printing which exceeded £10,000.

Lodge, THOMAS, English dramatist, romance-writer, and poet, was born at West Ham about 1556. After studying at Trinity College, Oxford, he entered at Lincoln's Inn, but seems to have led a wild and rollicking life, using his pen occasionally, as in a duel with Gosson, against whom he defended stage plays in a couple of pamphlets (edited by D. Lang for the Shakespeare Society in 1853). In 1589-91 he varied his life by taking part in two sea-expeditions against the Spaniards, in the neighbourhood of the Azores and Canary Islands. On

the first of these voyages he wrote an eulphastic romance, *Rosalynde* (1590; reprinted in Hazlitt's *Shakespeare's Library*, vol. ii., and again, separately, in 1887), which supplied England's great dramatist with the chief incidents, and even more than the chief incidents, of *As You Like It*. Lodge himself wrote two second-rate dramas, *The Wounds of Civil War* (1594; reprinted in Hazlitt's Dodsley's *Select Collection of Old Plays*, vol. vii.), and *A Looking-glass for London and England* (1594), written in collaboration with Robert Greene (q.v.), another dissipated author. He was generally stated to have been a player, until the point was effectively disproved by C. M. Ingleby in 1868. But he is believed to have taken a medical degree at Avignon, and to have written a *History of the Plague* (1603). He died himself of the plague in 1625. Of his remaining writings we may mention *A Fig for Moanus* (1595; reprinted in Sir A. Boswell's *Frondeur's Calendar*, 1817); translations of Seneca (1614) and Josephus (1602); *Life of William Longshard* (1593); *History of Robin the Drevell, Wals Miseric, and Glanous and Salla* (poems, one of which suggested the plan of Shakespeare's *Veins and Adonis*, 1589). See the *Works*, edited by Gosse (4 vols. 4to, 1884).

Lodgings in another person's house constitute the relation of landlord and tenant. It is not necessary that the contract should be in writing, though it is highly expedient. In England, unless there has been part performance, a verbal contract to let lodgings cannot be enforced, since it is an agreement relating to land, and so void by the Statute of Frauds. But where a furnished house is let, and a written agreement or lease is used, it is absolutely necessary that there should be a stamp on such writing, which, if adhesive, must be cancelled by the parties under a penalty of £10. One of the risks which the lodger in England ran was that if his landlord, L, were himself a tenant to A, then, if L's rent were in arrear, the lodger's goods might be taken by A to pay this, for the rule was that all goods found on the premises (with certain definite exceptions, of which this was not one) could be taken under a distress for rent; but by the 31 and 35 Viet. chap. 79, 1871, it was provided that, if the lodger has paid the mesne (or intermediate) landlord, the superior landlord must leave his goods alone; if he has not paid the mesne landlord, then he may pay the superior landlord in lieu of the mesne landlord, and again obtain protection for his goods. The statute 2 and 3 Viet. chap. 71, sect. 38, provides that a police-magistrate may award compensation up to £15 for wilful damage done by lodgers. The Larceny Act, 1861, makes the stealing of chattels or fixtures by lodgers a felony punishable by imprisonment for two years or penal servitude for seven years, according to the value of the thing stolen.

A lodger is entitled to the use of the door-bell and knocker, and the landlord impliedly promises that the rooms are fit for occupation. In letting an unfurnished house there is no such implication. A lodging-house keeper, even where he keeps a boarding-house, which nearly resembles an Inn (q.v.), is not liable for the safe custody of the lodger's goods. He is merely liable for ordinary care; but he does not warrant at all hazards that the goods will not be stolen. Even if the lodger's goods are stolen by a servant of the house, the lodging-house keeper is not liable. The notice to quit depends on how the lodgings were taken. If they were taken by the week, a week's notice is sufficient; if by the month, a month's; and if by the quarter, a quarter's notice, unless some other agreement was made. Hence, if the lodger quits without notice, he is liable for one week's, or month's, &c. rent, even

though the landlord put a notice in the window. The lodging-house keeper may distrain the lodger's goods for unpaid rent. When a lodger refuses to quit the lodgings after a notice has expired he cannot be put out by force, but in many cases a summary remedy is given for recovering possession. Since 1868 a lodger is entitled to vote for members of parliament in boroughs, if he pays rent of the clear annual value of £10, provided also that he has resided twelve months in the district, and put in his claim to be registered. The lodger-franchise was extended to counties by the Representation of the People Act of 1884. In Scotland the lodger's goods cannot be taken by the landlord of the lodging-house keeper for rent, nor is it yet decided whether the householder's liability in case of loss of the lodger's goods is equal to or less than that of an innkeeper.

Continental Lodging-houses, where poor people lodge by the night, are subject to police supervision. The Public Health Act, 1875, provides (in continuation of earlier statutes) for their registration and inspection, and enacts that they are only to be kept by registered keepers. Before being licensed they are inspected by the medical officer of health, every room being measured and restricted to a specified number of lodgers. Every room has this number painted on the door, and a copy of the police regulations is posted up in a conspicuous part of it. The keepers are bound to thoroughly cleanse all the rooms, stairs, &c., as often as by laws shall direct, and to keep a proper supply of water. If fever break out notice must be given to the local authority. These duties are enforced by means of penalties. The same act directs that, if any person suffering from any dangerous infectious disorder has lodged in any rooms, such rooms must be disinfected to the satisfaction of a legally qualified medical practitioner, as testified by a certificate signed by him, before they are again let. Similar provisions are in force in Scotland and Ireland. Of recent years very great improvements have been effected in common lodging-houses. In most large towns in Great Britain 'model lodging-houses' have been erected on approved plans, wherein greater privacy is ensured in the sleeping quarters, and a complete system of ventilation secured. The latest inventions in cooking apparatus, washing-houses, &c. have been introduced; while reading, recreation, and bath rooms form indispensable parts of these establishments. See VAGRANTS.

Lodi, a town of North Italy, stands on the Adda, 18 miles by rail SE. of Milan. It has a Romano Gothic cathedral dating from the 12th century; manufactures of linens, silks, and Majolica porcelain; and a great trade in Parmesan and Stracchino cheese and wine. Pop. 18,689. -- **Lodi Vecchio**, a ruined village, 4 miles W., was destroyed by the Milanese in 1111-58. Here Bonaparte, on 10th May 1796, forced the long and narrow bridge in the face of a tremendous fire from the Austrian batteries.

Lodomeria (Lat. for Vladimir), formerly an independent principality in Volhynia, has, since the division of Poland in 1772, constituted an integral part of the Austrian 'kingdom of Galicia and Lodomeria.' See GALICIA.

Lodz, sometimes called 'the Manchester of Poland,' lies 76 miles SW. of Warsaw on a branch railway. It consists chiefly of one main street, 6 miles or more long, and has more than 120 manufactories making cotton and woollen stuffs. Pop. (1879) 39,978; (1881) 49,332; (1895) with enlarged boundaries, 119,309, nearly half Germans.

Loess. See BOSS.

Loewe, JOHANN CARL GOTTFRIED, composer, was born 30th November 1796, between Kothen

and Halle, the twelfth son of a schoolmaster. He became a choir-boy at Kothen, later studied music and theology at Halle, and in 1821 settled at Stettin, where he became successively professor in the gymnasium, musical director to the city, and organist. He made visits to Norway, Sweden, and France, and in 1847 sang and played before the English court in London. He died 20th April 1869. He composed five operas (of which only one, *The Three Wishes*, was performed), sixteen oratorios (several of them for voices only, without accompaniment), and numerous symphonies, concertos, duets, and other works for the pianoforte. But his ballads are his most notable bequest to posterity: they are, many of them, remarkable dramatic poems, and in some respects Loewe may claim to have done for the ballad what Wagner did for opera. Gehring, in Grove's *Dictionary* (1880), said that Loewe's 'music has gone for ever,' but more recently a good deal of attention has been called to the ballads. See *The Art Ballad, Loewe and Schubert*, by A. Bach (Edin. 1890).

Lofft, CAPLE, described by Byron in *English Bards* as 'the Mæcenas of shoemakers and preface-writer-general to distressed versemen; a kind of gratis acconcheur to those who wish to be delivered of rhyme, but do not know how to bring forth.' This description, though not the ill-nature of it, was so far just that Lofft was the patron of Bloomfield, and stood sponsor to his *Farmers' Poem*. Lofft himself was a London barrister of the Whig persuasion, with a taste for letters, especially poetry: he wrote some legal treatises and magazine articles, and books on theological, astronomical, political, and poetical subjects. All are now forgotten. He was born in London on 11th November 1751, and died at Moncalieri, near Turin, on 26th May 1824. See *Gentleman's Magazine* (1824).

Lofoden, or LOFOFEN, a chain of islands on the north-west coast of Norway, between 67° and 69° 15' N. lat., and stretching south-west and north-east for 150 miles. They include the Lofoten proper and the Vesterdaalen, lying farther north. The largest islands are Hind, And, and Lang in the Vesterdaalen group, and East Vaag, West Vaag, Flakstad, and Moskenas in the Lofoten proper. Total area, 2247 sq. m. All of them are rugged and mountainous, many of the summits being crater-shaped. In several places they present walls of bare rock rising sheer from the ocean. The highest point is 3090 feet above sea-level. The waters on the east side of these islands are visited in January to March every year by vast shoals of cod fish, which attract a large fleet of fishermen. The average number of boats is 5000 to 6000, manned by 28,000 to 30,000 men; and the produce of the fishery is about 30,000,000 fish, 24,000 barrels of cod-liver oil, and 25,000 to 26,000 barrels of roe. The fishing is attended with considerable danger, on account of the sudden and violent storms from the west, and of the strong currents which set in between the islands (see MAELSTRÖM). Besides fishing, sheep-farming is also carried on, as, owing to the influence of the Gulf Stream, the winters are mild and grass grows abundantly. The permanent population number about 20,000.

Log is the instrument by which a ship's rate of motion through the water is measured. In its oldest and simplest form it is a quadrantal piece of teak wood called a log-ship, loaded in the air so as to float vertically, point upwards. Every hour or two hours it is hove overboard for twenty-eight seconds, or, if the ship is going very fast, for fourteen seconds. It is attached to a line called the log-line. The supposition is that when hove into the sea it will remain stationary in the water while

The log-line is freely paid out from a reel held by hand on board. In actual practice a conical canvas bag, called a log bag, with its open mouth facing the vessel, is often used instead of the log-ship. The log-line, which is attached to the log-ship or to the log bag, is divided into equal sections by pieces of marline which are tucked through its strands, each section being that part of a geographical mile which twenty-eight seconds is of an hour, so that the number of sections of the log-line which run out during twenty-eight seconds is the same as the number of geographical miles which the ship is going per hour at the time of testing the speed. To facilitate counting the number of sections of the log-line which have been paid out, one, two, three, &c. *Knots* (q.v.) are tied on the

Fig. 1.—Rotator with four vanes.

tails of the pieces of marline. In practice, each section is made 46 feet 8 inches long, which is designedly rather shorter than the theoretical length.

A ship's progress through the water is, however, much more generally obtained, especially near land, by towing continuously a small cylindrical tube to which are attached oblique vanes, usually four in number. This rotator, as it is called, revolves as it is towed with a speed which is proportional to the speed of the vessel. This proportion is ascertained by experiment by the makers, and a registering apparatus, consisting of the usual cog-wheels and pinions, records the revolutions of the rotator, and so records the progress of the ship. In the older form of this log the registering gear is

Fig. 2.—Log Register (A), with governing fly-wheel (B) attached, the tow-line being hooked on at C.

attached directly to the rotator, and is towed with it through the water. The progress of the ship can in this case only be ascertained by hauling the log on board. In the newest forms the rotator alone is in the water. The registering gear is contained in a small case which is secured to the taffrail of the ship, or to an outrigger, so that it can be conveniently read at any moment, the revolutions of the submerged rotator being transmitted to the taffrail register by the tow-line which also rotates. A fly wheel or rotating triangle or dumb-bells are placed on the tow-line between the rotator and the register, but close to the register, to secure greater smoothness in the working of the latter. The registering dial is usually graduated to knots (nautical miles) up to 100, and a smaller dial gives subdivisions of a quarter of a nautical mile. An automatic bell rings at every mile. But even under the most favourable circumstances a navigator is

not justified in regarding any form of log as an instrument of precision.

Log-book.—The courses steered, distances run, wind, state of the weather and sea, leeway, daily employment of the crew, and other incidents, which in the first instance are noted at the moment in the bridge-book or deck-book, are daily entered in the log-book, which thus becomes the diary of the ship.

Official Log-book.—The official log-book is a book issued by the Board of Trade at the beginning and returned to that department at the end of each voyage. It contains a record of the crew and their characters, ship's draught of water, offences committed, desertions, sickness, deaths, medical treatment, collisions, &c., and is thus a sort of civil or police record of the voyage.

Logan, JOHN, poet and sermon-writer, was born at Sontra, in Midlothian, in 1748. His father was a small farmer, but was able to send his son to college. In 1773 he was licensed as a preacher, and from his eloquence and fervour in the pulpit soon became so popular that he was chosen minister of the second charge of South Leith parish that same year. In 1786, however, owing to intemperate habits, and for kindred reasons, he was constrained to resign his charge, after which he proceeded to London, and there engaged in literary work. He died there, December 28, 1788. Besides two volumes of sermons and lectures which were published after his death, he was the author of a tragedy called *Kennilode*, but this, after a single performance at the Edinburgh Theatre, was withdrawn from the stage. In 1781 he published a volume of poems, which, though coldly received in critical circles, speedily reached a second edition. His name is best known now in connection with that of Michael Bruce and the controverted authorship of the 'Ode to the Cuckoo' and certain of the Paraphrases. The most effective statement in behalf of Logan's claims which has yet appeared will be found in two papers by the Rev. Robert Small, Edinburgh, which were published in the *British and Foreign Evangelical Review* for 1879. That Logan is entitled to a place among the minor poets of Scotland is sufficiently attested, though there were nothing more, by his exquisite lyric, 'The Braes of Yarrow.'

Logan, JOHN ALEXANDER, an American statesman, was born in Illinois, the son of an Irish doctor there, in 1826. He served in the Mexican war, was admitted to the bar in 1852, and was elected to congress as a Democrat in 1858. He raised an Illinois regiment at the beginning of the civil war, and served with credit to the last battle, retiring with the rank of major-general. In 1866 he was returned to congress as a Republican, and was one of the managers of the impeachment of President Johnston. He was chosen a United States senator in 1871, and was returned to the senate in 1879 and in 1885. In 1881 he was nominated by the Republicans for the vice-presidency of the United States, but was defeated along with James G. Blaine (q.v.). He died in Washington, 26th December 1886. There is a Life by G. F. Dawson (Chicago, 1887).

Logan, SIR WILLIAM EDMOND, geologist, was born, a Scotch baker's son, at Montreal, in Canada, on 20th April 1798, and in 1814 was sent over to Edinburgh High School. For ten years he worked in a commercial counting-house in London, and was then, about 1828, sent to Swansea to take charge of the finances of a copper-smelting

company. Whilst living in South Wales he prepared geological maps of the coal basins in that part of the country, and his work was so well done that it was incorporated in the 1-inch maps of the Geological Survey. In 1842-71 Logan was director of the Canadian Geological Survey. He was the discoverer of the Stigmairia underclays and of the *Eozoon Canadense* (q.v.). He was knighted in 1856, and died in Wales, 22d June 1875. See the *Life* by Harrington (1883).

Logan. See ROCKING-STONE.

Loganiaceæ, a natural order of corollifloral exogens, consisting of trees, shrubs, and herbaceous plants, with opposite entire leaves, and usually with stipules, which adhere to the footstalks, or form sheaths. A few species of this order occur in Australia and in the temperate parts of North America; the rest are all tropical or subtropical. No natural order of plants is more strongly characterised by poisonous properties. It includes the genus *Strychnos* (q.v.; and see *NUX VOMICA*) and the Curai Poison (q.v.). See also SPIGELIA.

Logansport, capital of Cass county, Indiana, is 75 miles N. by W. of Indianapolis, at the crossing of three railroads, where the Eel River joins the Wabash. There are extensive railway-shops, besides flour and lumber mills and foundries; and the town has a large shipping trade in grain, pork, &c. Pop. (1880) 11,198; (1890) 13,328.

Logarithms, a series of numbers having a certain relation to the series of natural numbers, by means of which many arithmetical operations are made comparatively easy. The nature of the relation will be understood by considering two simple series such as the following, one proceeding from unity in geometrical progression, the other from 0 in arithmetical progression:

Geom. series, 1, 2, 4, 8, 16, 32, 64, 128, 256, 512, &c.

Arith. series, 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, &c.

Here the ratio of the geometrical series is 2, and any term in the arithmetical series expresses how often 2 has been multiplied into 1 to produce the corresponding term of the geometrical series; thus, in proceeding from 1 to 32, there have been 5 steps or multiplications by the ratio 2; in other words, the ratio of 32 to 1 is compounded five times of the ratio of 2 to 1. It was this conception of the relation that led to giving the name of *Logarithms* to the terms of the arithmetical series, the word *logarithm* (Gr. *logon arithmos*) meaning 'the number of the ratios.' As to the use that may be made of such series, it will be observed that the sum of any two logarithms (as we shall now call the terms of the lower series) is the logarithm of their product—e.g. 9 (= 3 + 6) is the logarithm of 512 (= 8 × 64). Similarly, the difference of any two logarithms is the logarithm of the quotient of the numbers; a multiple of any logarithm is the logarithm of the corresponding number raised to the power of the multiple—e.g. 8 (= 4 × 2) is the logarithm of 256 (= 16²), and a submultiple of a logarithm is the logarithm of the corresponding root of its number. In this way, with complete tables of numbers, and their corresponding logarithms, addition is made to take the place of multiplication, subtraction of division, multiplication of involution, and division of evolution.

In order to make the series above given of practical use, it would be necessary to complete them by interpolating a set of means between the several terms, as will be explained below. We have chosen 2 as the fundamental ratio, or base, as being most convenient for illustration; but any other number (integral or fractional) might be taken; and every different base, or *radix*, gives a different system of logarithms. The system now in use has 10 for its

base; in other words, 10 is the number whose logarithm is 1.

The idea of making use of series in this way would seem to have been known to Archimedes and Euclid, without, however, resulting in any practical scheme; but by the end of the 16th century trigonometrical operations had become so complicated that the wits of several mathematicians were at work to devise means of shortening them. The real invention of logarithms is now universally ascribed to John Napier (q.v.), Baron of Merchiston, who in 1614 printed his *Canon Mirabilis Logarithmorum*. His tables only give logarithms of sines, cosines, and the other functions of angles; they also labour under the three defects of being sometimes + and sometimes -, of decreasing as the corresponding natural numbers increase, and of having for their *radix* (the number of which the logarithm is 1) the number which is the sum of $1 + 1 + \frac{1}{1.2} + \frac{1}{1.2.3} + \dots$, &c. In many calculations, however, the latter is an advantage rather than a defect. These defects were, however, soon remedied; John Speidell in 1619 amended the tables in such a manner that the logarithms became all positive, and increased along with their corresponding natural numbers. He also, in the sixth edition of his work (1624), constructed a table of Napier's logarithms for the integer numbers, 1, 2, 3, &c., up to 1000, with their differences and arithmetical complements, besides other improvements. Speidell's tables are now known as *hyperbolic logarithms*. But the greatest improvement was made in 1615, by Professor Henry Briggs (q.v.), of London, who substituted for Napier's inconvenient 'radix' the number 10, and succeeded before his death in calculating the logarithms of 30,000 natural numbers to the new radix. Briggs's exertions were ably seconded; and before 1628 the logarithms of all the natural numbers up to 100,000 had been computed. Computers have since chiefly occupied themselves rather in repeatedly revising the tables already calculated than in extending them.

Construction of Tables.—The following is the simplest method of constructing a table of logarithms on Briggs's system. The log. of 10 = 1; the log. of 100 (which is twice compounded of 10) = 2; the log. of 1000 = 3, &c.; and the logarithms of all powers of 10 can be found in the same manner. The intermediate logarithms are found by continually computing geometric means between two numbers, one greater and the other less than the number required. Thus, to find the log. of 5, take the geometric mean between 1 and 10, or 3.162..., the corresponding arithmetic mean (the log. of 1 being 0, and that of 10 being 1) being 0.5; the geometric mean between 3.162... and 10, or 5.623..., corresponds to the arithmetic mean between 0.5 and 1 or 0.75; the geometric mean between 3.162... and 5.623..., or 4.216..., has its logarithm = $\frac{1}{2}(0.75 + 0.5)$ or 0.625; this operation is continued till the result is obtained to the necessary degree of accuracy. In this example the twenty-first result gives the geometric mean = 5.000,003, and the corresponding arithmetic mean = 0.698,970, which is in ordinary calculations used as the logarithm of 5. Since division of numbers corresponds to subtraction of logarithms, and since $2 = \frac{10}{5}$, the log. of 2 = log. 10 - log. 5 = 1 - 0.698970 = 0.301030. The logarithms of all prime numbers are found in the same way as that of 5; those of composite numbers are obtained by the addition of the logarithms of their factors; thus the log. of 6 = log. 2 + log. 3 = 0.301030 + 0.477121 = 0.778151. This method, though simple in principle, involves an enormous amount of calculation; and the following method, which depends on the modern algebraic analysis, is much to be

preferred. According to this method, logarithms are considered as indices or powers of the radix; thus, $10^0 = 1$, $10^0 \cdot 301030 = 2$, $10^0 \cdot 477121 = 3$, $10^2 = 100$, &c.; and the laws of logarithms then become the same as those of indices. Let r represent the radix, y the natural number, x its logarithm; then $y = r^x$, or, putting $1 + a$ for r , $y = (1 + a)^x$; and it is shown by the binomial and exponential theorems (see the ordinary works on Algebra) that $y = 1 + \mu x + \frac{\mu^2 x^2}{1 \cdot 2} + \frac{\mu^3 x^3}{1 \cdot 2 \cdot 3} + \&c.$, where $\mu = r - 1 - \frac{1}{2}(r - 1)^2 + \frac{1}{6}(r - 1)^3 - \&c.$, the former equation expressing a number as the sum of different multiples of its logarithm and the radix. If $1/\mu$ be substituted for x , then $y = 1 + \frac{1}{1 \cdot 2} + \frac{1}{1 \cdot 2 \cdot 3} + \&c. = 2.71828182$, which, as before mentioned, is Napier's radix, and is generally called e . Hence $r = e^{\mu}$, or μ is the logarithm of r to the base or radix e . Then, referring to the above-mentioned value of μ , we have $\log_e r$ (i.e. log. of r to the base e) $= r - 1 - \frac{1}{2}(r - 1)^2 + \frac{1}{6}(r - 1)^3 - \&c.$, or, as before, putting $1 + a$ for r , $\log_e (1 + a) = a - a^2/2 + a^3/3 - \&c.$; a series from which $\log_e (1 + a)$ cannot be found, unless a be a proper fraction. But if we put $-a$ for a , $\log_e (1 - a) = -a - a^2/2 - a^3/3 - \&c.$; and, subtracting this expression from the former, $\log_e (1 + a) - \log_e (1 - a)$ or $\log_e \frac{1 + a}{1 - a} = 2a + a^3/3 + a^5/5 + \&c.$; and, for the sake of convenience, putting $(a + 1)/a$ for $(1 + a)/(1 - a)$, in which case $a = 1/(2a + 1)$, we finally obtain $\log_e \frac{a + 1}{a} = 2 \frac{1}{2a + 1} + \frac{1}{3} \frac{1}{(2a + 1)^3} + \frac{1}{5} \frac{1}{(2a + 1)^5} + \&c.$; or $\log_e \frac{a + 1}{a} = \log_e a + 2 \frac{1}{2a + 1} + \frac{1}{3} \frac{1}{(2a + 1)^3} + \frac{1}{5} \frac{1}{(2a + 1)^5} + \&c.$. If 1 be put for a in this formula, the Napierian logarithm of 2 is at once obtained to any degree of accuracy required; if 2 be put for a , the Napierian logarithm of 3 can be calculated, &c. Now, as logarithms of any system have always the same ratio to one another as the corresponding logarithms of any other system, no matter what its base, if a number can be found, which, when multiplied into the logarithm of a certain number to one base, gives the logarithm of the same number to another base, this multiplier will, when multiplied into any logarithm to the first base, produce the corresponding logarithm to the other base. The multiplier is called the modulus, and, for the conversion of Napierian into common or Briggs's logarithms, is equal to 0.4342944...; so that, to find the common logarithm of any number, first find the Napierian logarithm, and multiply it by 0.4342944.

As in Briggs's system the logarithm of 10 is 1, and that of 100 is 2, it follows that all numbers between 10 and 100 have for their logarithms unity + a proper fraction; in other words, the integer portion of the logarithms of all numbers of two figures is unity; similarly, the integer portion of the logarithms of numbers between 100 and 1000 is 2, and, in general, the integer portion of the logarithm of any number expresses a number less by unity than the number of figures in that number. This integer is called the *characteristic*, the decimal portion being the *mantissa*.

As the logarithm of 1 = 0, the logarithms of quantities less than unity would naturally be negative; thus, the logarithm of $\frac{1}{2}$ would be -0.30103. But, for convenience in working, the mantissa is kept always positive, and the negative sign only affects the characteristic; the logarithm of $\frac{1}{2}$ or 0.5 would thus be 4.69897, the characteristic in this and similar cases expressing, when the fraction is reduced to a decimal, the number of places the first figure is removed from the decimal point; thus, the logarithm of 0.0005 is 4.69897.

Directions for the use of logarithms in calculation will be found prefixed to any set of mathematical tables.

The tables most distinguished for accuracy are the French ones of Callet, Lalande, Bagays; Hutton's, those which Babbage produced with the aid of his calculating machine, Shortrede's, and Sang's; and the German ones of Gauss, Schron, Bruhns, Von Vega, Bremker. A serviceable handbook is *Chambers's Mathematical Tables*, edited by Pryde.

Loggia, an Italian word signifying an open arcade, enclosing a passage or open apartment. It is a favourite class of building in Italy and other warm countries. The Loggiade' Lanzi at Florence is one of the finest examples extant; and the Loggie of the Vatican, which are arcaded passages round the interior of the cortile of the palace, ornamented with beautiful paintings and arabesques by Raphael and his pupils, are well-known specimens.

Logic may be most briefly defined, in accordance with the etymology of the word, as the science of reasoning or 'the art of thinking.' It is a scientific account of the laws which regulate the passage in thought from one statement to another, and which must be observed if the thinking process is to be valid. The theory of every operation is later than its performance, and men were accustomed to think correctly long before they began to reflect upon their thinking faculties and the processes by which their results were reached. The attention which Socrates devoted to the meaning and justification of general names is signalled by Aristotle as the beginning of logical theory. It was Aristotle himself, however, who first elaborated the idea of the science, and defined its sphere by separating it from the metaphysical questions with which logical discussions are always associated in his predecessors. The six treatises afterwards collected under the name of the *Organon* contain the gist of what is still taught as formal logic; but the term logic was probably first used by the Stoics in the wide sense with which we are familiar. Aristotle himself possessed no single name for the science of which he was the founder.

The independence which Aristotle conferred upon the new science has enabled it to survive to the present day almost without change, and with very few additions of importance. But, while the edifice of Aristotle remains architectonically complete upon its own basis, it has become customary to add to this science of logic proper a second part, called Mixed, Material, or Inductive Logic, embracing an account of the methods of science and the conditions of scientific proof. The modern version of the Aristotelian Logic is then called, by way of distinction, Pure or Formal Logic. The meaning of this designation is that logic, as such, takes no account of the *matter* of our reasonings—i.e. of the things reasoned about; it deals solely with the *form* or skeleton of the reasoning process itself. Thus, if we say, 'Englishmen are white-skinned,' logic has no occasion to consider the truth of this statement as a matter of fact or science; it deals only with the form of the proposition or judgment as a general logical mould into which any pair of notions may be fitted. It treats the proposition, in short, only so far as it is expressible in the form, 'X is Y.' To this abstraction from all questions regarding the adequacy of our notions, and the material truth of our assertions, formal logic owes its completeness as a science. It looks upon thought, not as the expression of the truth of things, but as a series of mechanical operations, and its aim is to lay down the general or symbolic forms which these operations must assume in order to insure that the end shall be consistent with the beginning. It is apparent, then, that in any reasoning process formal logic only guarantees that the conclusion

is true *if* the premises from which we started were true. It has accordingly been called the logic of consistency, as opposed to induction, which seeks to be a logic of truth. Pure logic takes its material, as it were, ready-made from the hands of observation, and merely watches over its correct manipulation. Reasoning in the strict logical sense is, in fact, merely analytic; the conclusion only brings to explicit consciousness what was implied or involved in the premises. Formal logic is thus, in its most general aspect, an application, by means of many subordinate rules, of the laws of identity and non-contradiction. Practically, however, it is of great service in clarifying the thought of the individual, though, in a sense, merely teaching him what he knows already.

Formal logic is usually treated under the three heads of Notions, Judgments, and Reasonings; or, if regard be had to the verbal expression of thought, the Notion, Judgment, and Reasoning appear respectively as Term, Proposition, and Syllogism. Though pure logic has strictly nothing to say about the formation of general names or the adequacy of our notions, it is customary for logical writers to expound under the first head the nature of generalisation and definition—the processes by which our notions are formed and tested. The Judgment, however, may be taken as the unit in logic, for it is only in their relation as subject and predicate of a judgment that notions become susceptible of logical treatment. The combination of two judgments (involving three notions), in such a form that a third judgment is deduced from them, constitutes a Syllogism—e.g. 'All fishes are cold-blooded. The whale is not cold-blooded. Therefore the whale is not a fish.' The variations of this fundamental type of reasoning constitute the scholastic doctrine of the moods and figures of the Syllogism. As an appendix to this exposition of the normal forms of inference there follows a discussion of the different classes of fallacies to which any deviation from them may give rise. It is in this aspect that logic vindicates its claim to be 'a cathartic of the human mind.' For, like ethics, logic is a normative science; that is to say, it does not, like the physical sciences, or like psychology, simply generalise facts. Its laws are not statements of what always happens, but rules of what ought to be done. This distinction contains the answer to the question, once much debated, whether logic is a science or an art. The question is essentially a dispute about words.

The perception that pure logic treats thought simply as a process of comparison and classification has induced a number of recent logicians (chiefly English) to attempt an extension of Aristotle's scheme by a thorough-going application of the notion of logical quantity. Thus, Sir W. Hamilton maintained that the relation between subject and predicate in a proposition is that of logical equation. The proposition, 'All men are mortal,' means, when fully expressed, 'All men are some mortals.' If the predicate be thus explicitly quantified, it is evident that we may substitute for the copula the algebraical symbol of equation. This doctrine, which is known as the Quantification of the Predicate, was expounded by Archbishop Thomson, Spencer Baynes, and others. It leads to a multiplication of the old propositional and syllogistic forms, but in its Hamiltonian form it has been shown by Venn to rest on a confusion of views. A similar line of thought has been worked out by Jevons, who defines inference as 'the substitution of similars.' He would make the proposition run 'All men are mortal men' (*All a is ab*). De Morgan's formula for the proposition resembles this; but his innovations, as well as Boole's development of logic into a branch of

mathematics, are rather specimens of the ingenuity of their authors than transcripts of actual thought processes. They show no signs of taking their place as a permanent addition to logical doctrine. The same may be said of Jevons' Method of Indirect Inference, by which he claims to have reached the same results as Boole without the use of mathematics. The Method consists in 'developing' all the possible combinations of the terms mentioned in the premises, and then proceeding, by elimination of those which violate the conditions there laid down, to reach those combinations which are consistent with our data. Jevons applied his principle in the invention of a logical machine which effects this process of counting out with unerring accuracy; but where the terms are multiplied to any extent the operation is, of course, cumbrous in the extreme.

Bacon is commonly regarded as the founder of Inductive Logic. In his *Novum Organum* he put himself at the head of the revolt against the scholastic logic which marked the men of the Renaissance, and, though his own apprehension of scientific method was gravely defective, his eloquence and his position made him the most influential prophet of the scientific movement which Galileo and others had initiated. In point of fact he came to supplement the old, not to supersede it; but he allowed his dislike of the abuses of the Aristotelian logic to carry him away into indiscriminate denunciation. Bacon's animus is perhaps excusable as the zeal of the reformer; and it may be granted that in the Aristotelian logic, as in Greek philosophy generally, there is a tendency to let the study of words usurp the place of the investigation of facts. The middle ages had exaggerated this tendency by habitually assuming the distinctions existing among things to be correctly and adequately rendered by traditional names. Beyond this, Bacon's diatribes against 'syllogism' betray a misapprehension of the real function of formal logic, which, as has been seen, makes no pretensions to be an instrument of scientific discovery. Inductive theory has received many developments since the time of Bacon, notably at the hands of J. S. Mill. The progress of science has made it easier to formulate its methods and to determine the conditions of valid scientific proof. It is sufficient here to point out that, whereas in formal or deductive logic, reasoning proceeds from a whole to the particulars included under that whole, we seem in inductive logic to rise, in reliance on the uniformity of nature, from observation of particulars to the enunciation of a universal proposition. The nature of the certainty which belongs to such scientific generalisations is one of the subjects which the philosophy of induction has to deal with. The profound interest and value of these investigations, when compared with the rigid framework of symbols with which pure logic presents us, may well lead men to overestimate the former at the expense of the latter. But the two disciplines are essentially distinct; and the exactness and scientific completeness of pure or formal logic will always constitute it a valuable educational instrument.

BIBLIOGRAPHY.—The handiest elementary manuals of logic are those by Jevons and Fowler—Jevons' *Elementary Lessons in Logic*, Fowler's *Deductives and Inductive Logic*—to which may be added Whatly's *Logic*, an older book, and Keynes's *Formal Logic*, which is somewhat more advanced. Among larger treatises in English of comparatively recent date may be mentioned Mill's *Logic*, Hamilton's *Lectures on Logic*, Ueberweg's *Logic* (translated), Bradley's *Principles of Logic*, Bosanquet's *Logic*, Venn's *Empirical Logic*, Jevons' *Principles of Science*, Lotze's *Logic* (translated). The German works of Sigwart and Wundt should also be named. Thomson's *Out-*

lines of the *Laws of Thought*, Baynes's *New Analytic of Logical Forms*, Jevons' *Pure Logic and Other Papers*, Venn's *Symbolic Logic*, and the works of De Morgan and Boole deal with proposed developments of logic on algebraic lines. There is an elaborate history of logic by Fraulit in German; and the works of Trendelenburg in German and of Hamilton and Mansel in English are also valuable in this connection.

Logogram (Gr. *logos*, 'a word,' and *gramma*, 'a letter') is simply a complicated or multiplied form of the Anagram (q.v.), where the puzzlemonger, instead of contenting himself with the formation of a single new word or sentence out of the old by the transposition of the letters, racks his brain to discover all the words that may be extracted from the whole or from any portion of the letters, and throws the whole into a series of verses in which synonymic expressions for these words must be used. The puzzle lies in ascertaining what the concealed words are, and, through them, what is the primary word out of which they have all been extracted. A specimen is given in Henry B. Wheatley's book on *Anagrams* (1862), in which, out of the word 'curtains,' no less than ninety-three smaller ones are framed.

Logos (Gr., 'word,' and also 'reason,' corresponding in Latin to both *oratio* and *ratio*) is a term that has played an important part in philosophical and theological speculation, long ere the 'Word of God' came, through the fourth gospel, to be identified with the second person of the Christian Trinity. The notion of a certain self-manifestation or revelation of the Godhead, standing in some way between the infinite and the finite, has from time immemorial been the property of the whole East. With the Stoics the Logos is the active principle living in and determining the world (see *Stoics*). The apocryphal writers of the Old Testament personify the 'Wisdom' spoken of in Prov. viii. 22, and give it the functions of a Logos. In the Targum *Metura*, 'Word,' is constantly used instead of God or Jehovah. In the Jewish-Alexandrine philosophy (see *PHILO*) the Logos is the Divine Reason, the Power of all Powers, the Spirit of God. The doctrine of the Logos reaches its fullest development in St John's Gospel, where it is the Word of God incarnate. See *JOHN (GOSPEL OF)*, *CHRIST*, *TRINITY*.

Logroño (Lat. *Julia Briga*), the capital of a Spanish province, on the Ebro, 65 miles E. by N. of Burgos. It has manufactures of woollens, machinery, and leather goods. Pop. 13,393.

Logwood, the dark red heart-wood of *Hæmatoxylon campechiannum*, a tree of the natural order Leguminosæ. This tree, which is a native of Mexico and Central America, and has been naturalised in some of the West India Islands, grows to a height of 20 to 50 feet. The tree is generally felled when about ten years old, and the sapwood being worthless is hewed off with the bark. The heart-wood is slightly heavier than water, hard, and close-grained. It has a slight smell resembling that of violets, is astringent, and has a sweetish taste. The source of the colouring properties of logwood is a crystalline substance called hæmatoxylin, $C_{16}H_{14}O_6$, itself colourless when pure, but in an alkaline solution in the presence of oxygen (air) it becomes converted into hæmatein, $C_{16}H_{12}O_6$, which is of a purple-red colour. For dyes use ground or rasped logwood is moistened and made up into heaps or layers in a moderately warm place, where, turned over at intervals, it undergoes fermentation, ammonia being one of the products of the process. The result is that hæmatoxylin is first formed and afterwards hæmatein, crystals of which, of a reddish brown colour and greenish lustre, coat the particles of wood. The hæmatein or colouring matter is easily dissolved by placing the rasped wood, so treated, in hot water. Extracts

of logwood also are made for dyeing purposes. Logwood, although itself dark red, does not produce red colours either alone or with any of the ordinary mordants in use for it. Shades of purple, blue, lavender, drab, and gray are obtained from it with suitable mordants, but none of these are permanent. Its most important application is for dyeing black colours (see *DYEING*). It is also used in the manufacture of writing ink (q.v.). As a medicine logwood is sometimes given in cases of chronic diarrhœa. The introduction of coal-tar colours has not as yet materially diminished the use of logwood as a dyeing substance, as the quantity sent to Great Britain in 1888 (62,306 tons, valued at £366,131) rather exceeded the annual average imports twenty years earlier.

Lohengrin, the hero of an old High German poem, written in the end of the 13th century. He was the son of Parzival, and a knight of the Grail. At King Arthur's command he was taken by a swan through the air to Mainz, where he fought for Elsa, daughter of the Duke of Brabant, overthrew her persecutor, and married the lady. Then he accompanied the emperor to fight against the Hungarians, and subsequently warred against the Saracens. On his return home to Cologne, Elsa, contrary to his prohibition, persisted in asking him about his origin. After being asked a third time he told her, but was at the same time carried away by the swan back to the Grail. Rieckert's edition (1857) of the poem is the best. The poem is a continuation of Wolfram (q.v.) von Eschenbach's *Parzival*. Wagner made it the subject of his great opera, *Lohengrin* (1848).

Loir. See *DORMOUSE*.

Loire (anc. *Liger*), the longest river in France, has its source in the Cévennes, in the department of Ardèche, at an elevation of 4511 feet, flows in a north and north-western direction through the centre of France as far as Orleans, where it bends round to the south-west and continues on to Tours; thence it follows, in general, a western course to its embouchure in the Bay of Biscay. It is tidal to Nantes (q.v.), 35 miles from its mouth. Entire length, 620 miles. It becomes navigable a little above Roanne, 550 miles from the sea. At one time the depth of the water at its mouth was 19½ feet at ebb-tide; now it is only about 6½ feet. This is due to the vast quantity of sedimentary matter the river brings down with it. To the same cause are due the numerous islands that obstruct its lower course and the sandbanks that lie athwart its mouth. The Loire is notorious for the destructive inundations it causes, although the lower part of its course is protected by large dykes or *levées*, 20 feet high. The principal tributaries are the Nièvre and the Maine (which is formed by the Sarthe, its affluent the Loir, and the Mayenne) on the right; and the Allier, Cher, Indre, and Vienne, on the left. The Loire is canalised along considerable stretches of its course, and is connected with the Seine, the Saône, and the harbour of Brest by canals. Its valley is extremely fertile. Area of drainage basin, 44,450 sq. m. See *The Seine and the Loire*, with sixty-one illustrations by Turner (new ed. 1886).

Loire, a department in the south-east of France, formerly part of the province of Lyonnais and the county of Forez, comprises the arrondissements of Montbrison, Roanne, and St Etienne, with St Etienne for its capital. Area, 1838 sq. m.; pop. (1872) 550,611; (1891) 616,227. The basin of the Loire in this department is a rather unfruitful valley, but the mountains yield iron and lead, and the coalfields are the richest in France. Some 17,000 miners are employed in the extraction of nearly 3,000,000 tons of coal annually, 25,000 in the iron industries, 12,000 in the silk, and 5500

in the cotton industries. Woollens, linen, glass, paper, leather, &c. are likewise manufactured. Wine, fruit, fodder, and potatoes are the principal agricultural products. Timber and turpentine are yielded by the pine woods. Mineral springs abound, as at St. Galmier, St. Alban, &c.

Loire, HAUTE, a department of central France, formed out of the former province of Languedoc, the duchy of Auvergne, and the district of Forez, and bounded on the south by Lozère and Ardèche. The Loire crosses it going northwards, the Allier going north-westwards. Area, 1915 sq. m.; pop. (1872) 308,732; (1891) 316,735. The surface forms a plateau, deeply trenched by river-courses; it ranges in elevation from 2000 to 3000 feet, and rises in peaks and domes up to 5755 feet above sea-level (Mount Mézenc). In spite of the ungenerous nature of the soil, agriculture is the chief calling of the inhabitants. But about 120,000 persons find employment at home in making lace from wool, cotton, flax, silk, gold, and silver. Some thousands of the inhabitants leave their houses for a time every year, to work in other parts of France. Coal and building-stone are worked. The arrondissements are Le Puy, Yssingeaux, and Brioude; the capital, Le Puy.

Loire-Inférieure, a maritime department in the west of France, formed out of the southern portion of the old province of Brittany, and comprising the arrondissements of Nantes, Ancenis, Paimbœuf, Châteaubriant, and St. Nazaire, with Nantes for its capital. Area, 2654 sq. m.; pop. (1872) 602,206; (1891) 645,263. It has a coast-line of 78 miles. The Loire, flowing westwards, intersects it and forms a wide estuary; the Vilaine skirts its north-west boundary. In the south of the department lies the lake of Grand-Lieu, 26 sq. m. in extent. The interior is on the whole flat, and the soil fertile, producing cereals, potatoes, beet-root, hemp, and fodder. Bees are kept. There are fine oak and pine forests. Salt marshes are numerous along the shore. The vineyards yield annually about 30 million gallons of wine, and the orchards some 4½ million gallons of cider. Granite, slate, and limestone are quarried. The industrial establishments include ironworks, sugar-refineries, glass-works, factories for tinning fruits and sardines, &c. St. Nazaire has grown into an important seaport, having taken the place formerly occupied by Nantes. Shipbuilding is carried on at Nantes. The coast-fisheries and general export trade are extensive.

Loiret, a department of central France, formed out of the old provinces of Orléanais and Berri, and comprising the arrondissements of Orleans, Montargis, Gien, and Pithiviers, lies on the northern loop of the Loire. Area, 2614 sq. m.; pop. (1872) 355,921; (1891) 377,718. The county is for the most part an elevated, fertile plain, producing corn and wine in abundance, except in the sandy district of Sologne, lying south of Orleans, the chief town. Loiret contains several large forests. Cattle, sheep, and bees are extensively reared. Pottery and porcelain, sugar, vinegar, and soap are the principal industrial products.

Loiret-et-Cher, a department of France, formed out of the old province of Orléanais, comprises the arrondissements of Blois, Vendôme, and Romorantin. The Loire flows through it south-westwards, almost bisecting it. The south-eastern portion belongs to the infertile district of Sologne. The Loire crosses it parallel to the Loire farther to the north-west. Area, 2452 sq. m.; pop. (1872) 268,891; (1891) 280,958. The department is almost a uniform plain. The chief products are corn, fruits, wine, beetroot, and timber. Fish, poultry, and bees abound. Principal town, Blois.

Loja, a decayed town of Spain, on the Genil, 32 miles by rail W. of Granada. It suffered severely from earthquake in 1885. Pop. 18,249.

Lokeren, a town of Belgium, 11 miles by rail N.E. of Ghent, with manufactures of linen, cotton, and woollen goods, lace, chemicals, and tobacco, and large bleach fields. Pop. (1890) 19,667.

Loki, a demigod in the Scandinavian mythology. He did not belong to the race of the Æsir, but to an older dynasty. His appearance is beautiful, and he is possessed of great knowledge and cunning. He often brings the new gods into difficulties, from which, however, he again extricates them. Hence he is to be regarded as the principle of strife and disturbance in the Scandinavian mythology; the 'Spirit of Evil,' as it were, mingling freely with, yet essentially opposed to, the other inhabitants of the Norse heaven, very much like the Satan of the Book of Job. By his artful malice he caused the death of Balder (q.v.). See SCANDINAVIAN MYTHOLOGY.

Lokmán, the reputed author of a certain number of Arabic fables, who gives a title to a *Sura* of the Koran. He is variously said to have been a Nubian slave contemporary with David, and the son of Job's sister or daughter; but others again follow M. Derenbourg (*Fables de Lokmán le Sage*, 1850) in identifying him with Balaam, both names signifying 'devourer.' It is now generally admitted that the fables attributed to his name are late and of Greek origin. See *The Thousand Nights and a Night*, Lady Burton's edition, vi. p. 260.

Lolium. See DARNEL, and RYE-GRASS.

Lollards, a name given to the followers of Wyclif. *Lollardus* was a Latinised form of the old Dutch *lollaerd*, literally 'a singer of psalms,' a term which had been applied to a sect in Brabant akin to the Fratitelli and Beghards; but in English usage it was confounded with the native word *loller*, 'a lazy fellow.' Wyclif's Bible had supplied England with the phraseology and the seminal ideas of a popular theology, and his peripatetic 'poor priests' preached evangelical religion fearlessly throughout the land. Oxford University was a stronghold of the new doctrines, which were most widely spread in the district between the Thames and the Trent. The Lollards' petition to parliament in 1395 contained the famous twelve *Conclusions* against temporal possessions of the church; the ordination of unfit priests; the celibacy of the clergy, and all vows of chastity; exorcism, and blessing of inanimate objects; transubstantiation, the holding of secular offices by priests, prayers for the dead, pilgrimages, image-worship, compulsory auricular confession, war, capital punishment, and such trades as fostered luxury, like those of the goldsmith and the armourer. Many also objected to oaths, denied the necessity of baptism for salvation, and held marriage a mere civil contract. The corruptness and ignorance of the preaching friars made the progress of the new doctrines the easier, and ere long they had obtained enormous influence. There is no doubt that Lollardism prepared the soil for the Peasant revolt of 1381. Its popularity was imperilled by the extravagance of its devotees, and its adherents fell off rapidly under Henry IV., being vigorously persecuted by Archbishop Arundel. The statute, *De Heretico Comburendo*, was passed, and William Sawtre, a Norfolk priest, was burned in 1401, John Budby in 1410. Yet the Lollards remained numerous enough to be formidable at the accession of Henry V. Its most prominent supporter at that period was the martyr Sir John Oldcastle (q.v.), of Cobham, on whom many mocking ballads were written, and whose name was travestied for nearly two centuries after as a fat, dissolute old

knight, his mouth full of Scripture phrases: he was the prototype of Falstaff. Early in 1414 occurred the obscene attempted rising near London, which sent forty Lollards to their doom and proved the death-blow of the cause, but it was not till four years later that Oblecastle himself was captured and put to death. During the early years of Henry VI. the Lollards were sharply persecuted in London and the eastern counties, and some individuals were burned at London and Norwich. But ere long the government ceased to be strong enough for anything beyond self preservation, though it need not be supposed, because the persecution ceased, that the opinions had died out. After the accession of Henry VII. the persecution was renewed, and henceforward the Lollards appear as a secret brotherhood, called the 'known-men' or 'just-fast' men, marrying only among themselves, and instructed by itinerant readers in conventicles. Amersham, Colchester, and Newbury are noted as strongholds. From the time of Henry VIII. Lollardy becomes merged in the rising Protestantism, but it is worth noting that most of the Marian martyrs came from Lollard districts, and that much of their spirit and teaching reappears strongly in Puritanism. Lollardism made its way into Scotland in the 15th century, and became especially strong in the south-western counties, in later times the stronghold of the Covenant. In 1494 thirty persons belonging to the district of Kyle in Ayrshire were tried before James IV. in person, and dismissed with a caution to adhere to the doctrines of the church. *Piers Plowman* reflects closely the religious unrest of its time; but the same is by no means true of Chaucer, whose Parson, when he objects to profane swearing, is denounced as a Lollard.

An interesting account of Lollard principles may be gathered from Reginald Pecock's *Repressor of Over-much Blaming of the Clergy* (ed. by Churchill Babington, Rolls series, 1869), written about 1450. Here the writer assails the three erroneous 'trowings' maintained by Lollardists, or Biblemen, as he styles them. These were (1) that Christian men owe allegiance to nothing but the law of God as stated in Holy Scripture; (2) that any Christian is capable of grasping its plain meaning, if meek and willing to understand; (3) that no one who has so grasped the meaning of Scripture need listen to any clerk's interpretation from Scripture or reason, especially the latter. In the Lollardist assertion that there was no need of human learning to open up Scripture, they but anticipated a delusion not unknown among 19th-century evangelicals. Their claim that none but those enlightened by grace could understand Scripture opened a wider door for self-delusion and error.

Lolos, a fair complexioned aboriginal people on the frontiers of China and Tibet, mainly in Szechwan and Yun nan.

Lombard, PETER, one of the most famous of the Schoolmen, was born about the beginning of the 12th century, at a village near Novara, in Lombardy. He was educated at Bologna, and came to France with recommendations to Bernard of Clairvaux. His uncommon talents soon procured him a chair of theology in Paris. In 1159 he was appointed Bishop of Paris, but he died in the following year. He was very generally styled *Magister Sententiarum*, or the 'Master of Sentences,' from his work *Sententiarum Libri IV.*, an arranged collection of sentences from Augustine and other Fathers, on points of Christian doctrine, with objections and replies, also collected from other authors of repute. The first book treats of God; the second of the

creature; the third of the incarnation, redemption, and the virtues; the fourth of the seven sacraments and eschatology. A subtle heresy, *Nihilianism*, was detected by some in Peter's teaching, and the theological doctors of Paris in 1300 denounced it in sixteen propositions culled from his writings. Peter Lombard's work was the subject of many commentaries down to the time of the Reformation. His writings were edited by Aleaume (Louvain, 1546).

Lombard Architecture is the style which was invented and used by the Gothic invaders and colonists of the north of Italy, from about the age of Charlemagne till it was superseded by the importation of the Pointed style from France in the beginning of the 13th century. The architecture of the Lombards was derived from the debased Roman style which they found in the country—the general plan of the churches, and the general form of the pillars, arches, &c., being almost identical with those of the Roman Basilicas (q.v.). But in

detail, Roman traditions are almost entirely abandoned, and instead of the debased acanthus leaves and fragments of entablatures the Lombards adopted a freer imitation of natural forms in their foliage, and covered their buildings with representations of the fights and hunting-expeditions

in which they delighted. The north of Italy belonged at the time of Charlemagne to the great German empire, and thus we find nearly the same style of architecture in Lombardy and in Germany as far north as the Baltic (see RHEINISCH ARCHITECTURE). Few early examples of Lombard architecture exist. In the unruly times when the style originated, the buildings were no doubt frequently destroyed by fire; this seems to have led to the desire to erect fireproof structures, and thus the earlier as well as almost all the later examples are vaulted with stone. The earliest example is a small chapel at Frinli, built probably during the 8th century, and it is covered with an intersecting vault. Examples of this date are rare in Italy; but in Switzerland, where the style is almost identical, several interesting specimens of early architecture remain, such as the churches of Romain-Motier, Gramon, Payeme, &c. We there find the peculiar arch ornament so characteristic of Lombardy and the Rhine (Fig. 1), and we can trace the timid steps by which the Goths advanced in the art of vaulting.

The vaulting is the leading feature of Lombard architecture, and from it spring the other distinguish-

ing forms of the style. Thus, the plain, round pillars, with a simple base and capital, which served to support the side-walls and roof of a basilica, are changed for a compound pier, made up of several shafts, each resting on its own base, and each provided with a capital to carry the particular part of the vaulting assigned to it. This change is deserving of particular notice as the first germ of that principle which was afterwards developed in the Gothic (q.v.) styles. Buttresses are also introduced for the first time, although with small projection.

The cathedral of Novara is one of the most striking examples of Lombard architecture. It belongs to the 11th century. The plan (fig. 2) is derived from the old basilican type, having at the west end an open atrium, with arcade around, from which the church is entered by a central door. The interior is divided into central and side aisles, with vaulted roof, and terminated with an apsidal choir. At the end of the atrium opposite the

church is situated the baptistery. The same general arrangement of plan was common in the German churches, where the atrium was sometimes at a later period roofed over and included in the nave, and the baptistery changed into the western apse of the double-apsed churches.

San Michele at Pavia and San Ambrogio at Milan are also good early examples of this style. In both the grouping of the piers into vaulting shafts, wall-arch shafts, &c. is complete, and that beautiful feature of

Fig. 3.

the style, the arcade round the apse (fig. 3), is fully developed. The atrium and west front of San Ambrogio form one of the finest groups of Lombard architecture.

Lombards, a people of Germanic descent, who were called by the Latin writers *Longobardi* or, more correctly, *Langobardi*, a name which is differently derived by different authorities. 'Long beard,' *Longe Borde* = 'a long fertile plain beside a river,' *borde* being used in that signification in the Lower Elbe district, and *longa paxa* or *harte* = 'a long battle-axe,' have all been suggested as original forms of the name. The people so designated first appear in history as settled about the Lower Elbe, in Hanover and western Prussia, at the dawn of the Christian era. In the two centuries that followed they came more than once into conflict with the Romans; and then till the end of the 5th century nothing more is known about them. When next mentioned (*circa* 455) the *Longobardi* were settled in Moravia, and were tributary to the Herulians. The oppression of these masters stung them into revolt: they subdued the Herulians, and after them the Gepidae, and established themselves as the ruling race in Pannonia. Under Alboin, their king, they invaded Italy in 568, and at the end of three years had possessed themselves of the greater part of Northern and Central Italy, Pavia being the last city to submit. They subsequently extended their power as far south as Spoleto and Benevento, both of which duchies were held by Lombard dukes. His second successor, Authari, assumed the Roman

title of Flavius, and under the influence of his queen, Theodelinda, a Frankish princess, the nation began to change its Arian faith for the Catholic. The *Longobardi*, though never a numerous race, were distinguished above most of their Germanic brethren for their fierce love of war and their rude manners. But in Italy they soon fell under the influence of the existing civilisation: they adopted the Latin language, began to build churches and found monasteries, and gradually became assimilated with the Italians. King Rothari in 643, and his successors, embodied the legal customs of the Lombards in a code, written, however, in Latin—*Leyes Longobardorum*. Liutprand, king from 712 to 744, made an unsuccessful attempt to subdue all Italy. His strongest opponent was the pope, who summoned the Franks to his assistance. Charlemagne in 774 overthrew the Lombard dynasty, and had himself crowned king of the Franks and the Lombards; and thenceforward the Lombards were entirely merged in the Italians. The only traces extant of the Longobard language are a few names. Their earliest historian whose works survive, Paul the Deacon, wrote in Latin. See **LOMBARDY**.

The 'Lombards' in England.—In the 13th century Italian merchants from Lucca (even as early as the 9th century), Florence, and Piacenza, and at a later date from Venice and Genoa also, visited England for purposes of trade. They came originally to collect the taxes and dues payable to the pope, which they transmitted in large part in the shape of wool. They also traded on their own account, and in course of time, settling in the country, were granted special privileges, such as the right to farm the customs and to conduct the transactions on exchange. The merchants of Florence, for instance, had branches at Boston, Lynn, and Northampton, as well as at London, and regularly bought the wool of some 200 monasteries in England and Scotland. On occasion they lent large sums on loan, and gradually took up the business of banking, as it was understood in those days: Edward III. owed the Florentine house of Bardi the sum of 900,000 gold ducats, and another house of the same city, that of Peruzzi, 600,000 ducats. The Jews even took advantage of the favourable position of these Italians: many of them braved Edward I.'s edict of expulsion (1290), and stayed behind under the character of Lombard merchants, the name by which these Italians were generally known to the English. In London the Lombards dwelt principally in the street now called Lombard Street, still the chief centre of the banking interest. They eventually incurred as much odium as the Jews, not only because they exacted interest for their loans, but also because the commercial privileges accorded to them were believed to injuriously affect the native English merchants.

Lombardy, that part of Upper Italy which lies between the Alps and the Po, having the territory of Venice on the east, and Piedmont on the west. Its geographical characteristics are discussed under **ITALY**. Its history begins with the conquest by the Romans in 222, who called it *Gallia Cisalpina*. After the break up of the Roman empire it was successively in the hands of Odoacer, the Ostrogoths, the Byzantine emperors, and the Lombards (q.v.). Charlemagne incorporated it in his empire, but from 843 it was ruled by a separate line of kings, though before the kingdom ended (961) it had broken up into a number of independent duchies and civic republics. The Lombard cities, like those of Flanders at a later epoch, grew wealthy by industry and trade, and nurtured a vigorous love of freedom and independence. They resisted sturdily and successfully the attempts of the emperors Frederick I. and II. (q.v.) to curtail their

liberties, forming themselves into strong leagues, which were powerful enough to rout the emperors in pitched battles. But, freed from threatening danger, they began to quarrel amongst themselves, and the country was for many years more or less distracted by internal dissensions. After the death (1447) of the last duke of Milan, whose ancestor, Count Azzo, had acquired the sovereignty over nearly all Lombardy in 1337, the country was made an object of contention between the king of France and the emperor. The last named having got the better in the contest, Lombardy passed through Charles V. to Spain, which held possession of it till 1713, when the duchies of Milan and Mantua came into the hands of Austria. Napoleon made it part of the Cisalpine republic, the Transpadane republic, and the kingdom of Italy successively. But in 1815 it was restored to Austria, and associated with the newly-acquired Venetian territory. In 1859 Lombardy was given up to Italy, and divided into the provinces of Bergamo, Brescia, Como, Cremona, Mantua, Milan, Pavia, and Sondrio. See Hodgkins, *Italy and her Invaders* (vols. v. and vi.); W. K. Williams, *The Communes of Lombardy* (1891).

Lomond, Loch, the 'queen of Scottish lakes,' in Dumbarton and Stirling shires. Lies 23 feet above sea-level, and is 22 miles long, $\frac{3}{4}$ mile to 5 miles wide, 6 to 630 feet deep, and 27 sq. m. in area. It is studded with thirty wooded islands; receives the Endrick and six other principal streams; sends off the Leven 7 miles southward to the Clyde; contains trout, pike, and perch; is sometimes frozen over as far northward as Luss; and is enlivened by hills and, towards its head, Highland mountains, the highest of which, Ben Lomond (q.v.), attains 3192 feet. In 1263 Norsemen launched their galleys on Loch Lomond, having drawn them across the narrow isthmus of Tarbet; on Incheilloch stood of old a nunnery; and a cave is associated with both Bruce and Rob Roy.

Louza, the capital of a government in Poland, 80 miles N.E. of Warsaw, was formerly one of the most important cities of the country, but is now of secondary rank only. Pop. 15,000.

London is situated on the north or left bank of the Thames, about 60 miles from the sea, in 51° 30' 48" N. lat. and 5° 48" W. long. It may be reckoned the capital of the British empire, but the Houses of Parliament and the offices of government are in the adjoining city of Westminster. The Thames at London Bridge is about 900 feet wide, being much wider both above and below. This fact probably accounts for the original foundation of the city, which, according to many authorities, took place in 43 A.D., when Aulus Plautius was the Roman governor of Britain. The name is Celtic, and would appear to signify a fort on a lake or lagoon, the Thames being here a tidal estuary which covered all the low-lying land on which Rotherhithe, Newington, Southwark, and Lambeth are now situated. It seems likely that the easiest ford across the river was at Westminster, where it was widest (more than 1200 feet), and that by the building of London Bridge at the narrowest place the old Watling Street from Dover toward Chester was diverted. The old line led from Edgware through Tottil Fields to Westminster, where Stone Gate still marks the place of crossing. The newer road turned eastward at what we call the Marble Arch, and, passing diagonally from Newgate through the city, crossed by the bridge, and was carried on towards Dover on embankments among the shallows, the sites of which are still marked by such local names as Stone Street and Newington Causeway. The course of Watling Street in the

city was again diverted, probably in the 13th century, to make way for the extension of St Paul's Cathedral, and now no longer leads in the direction of Newgate.

During the greater part of the Roman occupation of Britain London consisted of two forts, one at either end of the bridge; and Ptolemy, the geographer, puts London in Cantium, where, and not on the left bank, it is very possible the largest of these forts may have stood. The unwall'd suburbs seem to have been populous and wealthy from an early period; and, when abandoned by Suetonius, they were burned by Boadicea in 61 A.D. They were still undefended in 286 and the subsequent years, when the rebel emperors, Carausius and Allectus, held both sides of the channel, making Clansentum (Bitterne, near Southampton) their headquarters in Britain. Asclepiodotus, the general of Constantius, defeated Allectus in the neighbourhood of London, and under one of the Constantines the place began to be looked upon with favour and to be extensively fortified. The wall which for so many centuries was destined to defend the boundaries of the city was built between 350 and 369, and enclosed a space which has been computed at 380 acres. In this Roman wall there was a gate due north of the bridge in what is now Canonile Street, and another at the spot at which the Watling Street, crossing the Fleet or Holborn, took its course towards Tyburn. The new city was defended on the east by the Lea and its extensive marshes, and on the west by the Fleet, whose waters were tidal as far up as what we call King's Cross. Traversing the middle of the city was the narrow stream of the Wallbrook, with the harbour of Dowgate at its confluence with the Thames, and from the remains which have been discovered it is probable that the chief Roman fort, before the building of the outer wall, was on the east or left bank of the Wallbrook, and extended far enough eastward to cover the approaches to the bridge. Some bastions of peculiar strength where the wall reached the Thames on the site of the Tower gave rise to the medieval tradition that the Tower of London was built by Julius Caesar. From 369 till 412 London was reckoned the capital of Britain, and enjoyed the title of *Augusta*. After the Roman departure London disappears from history until 457, when the Britons, fleeing before the victorious Hengest, took refuge behind the Roman wall. How far it availed them for defence we know not. London does not again emerge from complete obscurity for about a century and a half, but in 604 we find it named as the 'Metropolis' - i.e. the ecclesiastical capital - of the East Saxons. Mellitus was appointed first bishop, but the Saxons soon expelled him, and Christianity did not make much way with them until Ethelbert, king of Kent, the over-lord of the East Saxon king, took the matter in hand. A little later we hear for the first time of a tribe of Middle Saxons, but London was evidently a place of but small importance, apart from its bridge, as the Saxons preferred to fight without walls, and as no doubt the Roman defences had become greatly dilapidated. At length during the Danish wars they became completely ruinous, and London was abandoned and lay desolate during the long period of thirty years, the lifetime of a whole generation.

To King Alfred we must look as the real founder of modern London. He saw the possibilities of the place as a bulwark against the Danes, and, repairing the wall and gates, made the place again habitable. There is a tradition that he specially rebuilt and strengthened a work on the site of the Tower. During the long period of disaster which followed his reign, the kingdom of some of his

successors consisted of little else but London, which the Danes were never able to take, even though they made a canal round Southwark, and half rowed, half dragged their ships to Westminster. Undoubtedly the settlement made in London, whether by Alfred or by one of his immediate successors, formed the germ of the subsequent municipal government. Athelstan is often pointed to as the king who chiefly restored London, and, as we have nothing else, tradition must be received with some respect. The Roman lines of road and the gates were abandoned. New gates at Aldersgate, Newgate, and Bishopsgate were constructed, and posterns seem to have been opened at Landgate (A.S. *Ludgat*, 'a postern'), Cripplegate (A.S. *Crepulgat*, 'a covered way'), and possibly at what was afterwards Moorgate. There were two great market-places, one near the western gate, in which the folk-mote was held, and where stood the church of St Paul; and the other in East Cheap, of which the only modern remains are Leadenhall Market and the fish-market at Billingsgate. The West Cheap was bordered by the highway still called Cheapside, which led from Cornhill, the northern extremity of the East Cheap, by a bridge over the Wallbrook to the Westgate, now Newgate. There were many empty spaces within the circuit of the walls, and, if we may judge by the comparative size of the local divisions, the first settlers chose the shores of the Thames and the lines of the two great roads for their habitations. It is very probable that ecclesiastically the city was divided into three great parishes; one, of which St Paul's was the church, to the westward; a second, of which St Mary Aldermary was the church, in the centre; and a third, possibly dedicated to All Saints, or All Hallows, in the east.

The municipal government before the Norman conquest was not very complicated in form, and may be compared to that of a county elsewhere in England. The lords of manors in the city were represented by aldermen of wards, and the ward division is the oldest with which we are acquainted. Every magnate had his ward; and the government was carried on by the bishop who was alderman of the ward about St Paul's, and the portreeve who had the Portsoken outside the city to the east. It is not easy to unravel the knot presented to us by the names we meet with in old records of city officials in and before the 11th century. A guild, composed chiefly or wholly of aldermen, was perhaps, under the name of *Knigheten Guild*, the governing body; but this is by no means certain, nor is the tradition that King Edgar was their first founder. Some such body existed; its members transmitted their rights to their sons, and they may or may not have become the governing guild of the city. The king's reeve, or port-reeve—*port* probably denotes a market—answered to the sheriff or shire-reeve of a county; and the aldermen of wards had many and extensive powers on their respective estates, answering to those exercised in a county by the lords of manors. The reeve united in his own person many offices afterwards separated. He was chamberlain or treasurer; he was 'vicecomes,' and accounted to the king's exchequer for the farm of the city; he was coroner; he was escheator; he often bore office as a royal minister, like Ansgar, 'the staller,' who fought and was wounded at Hastings. William recognised the great position and ancient rights of London in a special charter by which the privileges enjoyed by the citizens under Edward the Confessor were confirmed to them; but the most important grant from the crown was that of Henry I., who, in 1101, in recognition no doubt of the assistance London had given him in his successful attempt to seize the crown, allowed them,

among other things, (1) the right to elect their own chief-magistrate, and (2) the farm of Middlesex at an annual rent, with power to appoint a sheriff of that county. These extraordinary grants, with that of leave to hunt in the neighbourhood of London, are so unlike what we should expect from a Norman king, that some have been tempted to suppose that they were all renewals of privileges enjoyed under the Saxon kings, and there is much plausibility in this view, but their recognition led eventually to the establishment of the mayor. The sheriffs of London and sheriff of Middlesex were no longer 'high' sheriffs; they were the nominees and deputies of the whole body of the citizens. As at Winchester, and some other places, the mayor does not seem to have received any royal acknowledgment during his first years of office; but the date 1189 is generally assigned as that of the first year of Henry, the son of Ailwin, an alderman of old family. There seems to be a question whether this Ailwin is to be identified with a citizen of that name who in 1125, with all his brethren of the Knighten Guild, became canons of the priory of Holy Trinity at the newly-opened Algate (now corruptly called Aldgate), and conferred, with the king's leave, the title of an alderman (of the ward of Portsoken) on their prior, Norman. Be this as it may, the necessities of the kingdom, and the difficulties consequent on the payment of the ransom of Richard I., must be taken as causes for the recognition of the new chief-magistrate; and down to our own day, when (Local Government Act, 1888) this ancient custom was abolished, the citizens elected annually, on Midsummer Day, two sheriffs for the city, one of whom was sheriff also of Middlesex on alternate days. They are now elected for the city only. They enter on their office on Michaelmas Day, and the citizens then proceed to choose the Lord Mayor. Legally any citizen is eligible for the mayoralty, but for many generations the senior alderman who has not passed the chair is chosen.

This may be the most convenient place in which to name the chief municipal officers. The mayor, who has been called 'Lord Mayor' from time immemorial, is held to rank as an earl, but within the city boundaries next to the sovereign. In commissions of Oyer and Terminer his name precedes even that of the Lord Chancellor, and since the reign of Edward III. he has sat as a judge. At first the Lord Mayor was a representative of the city in the House of Commons, and he still takes a seat at the opening of parliament on the ministerial bench. He attends at the Law Courts to be sworn in on the 9th November, and holds office for a year. He is in the city in the position of the Lord-lieutenant of a county, and a commission of lieutenancy is issued to him and the magistrates he may nominate. The Chamberlain is the city treasurer. The office was separated from that of mayor when the mayoralty was temporarily superseded in the reign of Edward I. He is the official guardian of the orphans of citizens, and has special charge of apprentices. He is annually re-elected during good conduct. The Recorder is the legal adviser of the Court of Aldermen. Geoffrey Hartpole, elected in 1304, was the first Recorder. The Common Serjeant stands in the same position toward the Common Council, who have also their Common Clerk, now called town clerk. The first Common Serjeant was Thomas Juvenal, elected in 1290. The Court of Aldermen now consists of twenty-six members, of whom the senior sits for the ward of Bridge without, or the borough of Southwark. The others are elected by the city wards.

The Common Council was first elected in 1200, when twenty-five citizens were chosen by the

wards to take council with the aldermen. There are now 206 common councillors.

The Common Hall consists only of members of the Livery Companies, and has obtained or usurped many of the rights of the whole body of citizens. An act passed in 1725 regulates admission to the franchise of the city through the livery, but seems to have been founded on a misapprehension, as the Act of 1475 which it was supposed to confirm does not seem to have ever existed. Admission to the citizenship could be obtained by application to the Hustings Court, as well as by joining a company, but the latter course, being the easiest, became usual, and so was supposed necessary.

The hustings, a meeting of the whole body of the citizens, was called in other cities Portmannimote, and was an assembly under cover, as distinguished from the folkmote, held at first in the open space between St Paul's and West Cheap, and afterwards in Smithfield.

The growth of this municipality was slow. At first the rights of the aldermen possessed of hereditary jurisdiction interfered with its progress; but by degrees all the wards were able to elect their aldermen. The interference of the crown also greatly retarded the prosperity of the city. Nevertheless, commerce increased, and the settlement of such foreign merchants as those of the so-called Steelyard, and of the Lombard and other Italian bankers, raised London by the time of Edward III. to a wealthy and prosperous condition. In reading a detailed history it is observed that weak sovereigns caused a depression of trade, while under a strong government confidence was restored and capital was safe. Henry III. was constantly at feud with the citizens, whom he greatly oppressed, leaving to his successor the task of dealing with the disorder he had created. Edward I., to use the language of contemporary chroniclers, 'took the city into his own hands,' and his ministers, Sandwich and Breton, governing like mayors, with the help of the aldermen and the common council, brought everything into order. In 1290 they expelled the Jews. After twelve years the mayoralty was restored. Under Edward II., again, there was disorder and discontent in the city, the great body of the citizens adhering to the party of the queen. Under Edward III. London prospered, new privileges were granted to the mayor, and the French wars were extremely popular. In the end, however, a reaction ensued, and under the weak government of Richard II. things did not improve. The usurpation, as many deemed it, of Henry IV., could hardly have succeeded had it not been for the support of the city; and Henry V., whose French victories inflated trade, was most popular with the citizens. Henry VI. was unable to grapple with the inevitable period of depression which naturally followed; and his queen, Margaret of Anjou, failing to gain the confidence of London, whose importance to the Lancastrian cause she did not know, contrived to divert the weight of the city influence into the opposite scale. The reign of Edward IV., with his strong commercial instinct, by reviving and creating outlets for foreign trade, restored the prosperity of the city. Under the Tudors there were great fluctuations. Although the settled government of Henry VII. tended on the whole to the satisfaction of the city, his continual exactions and the heavy fines he imposed for trivial offences, alienated its loyalty. The accession of Henry VIII. was an occasion of rejoicing. The tenets of the Reformation were warmly welcomed in London, where the priests, monks, and friars had become a heavy burden; and at first the high handed proceedings

of the king in the suppression of the religious houses and the confiscation of their endowments was a popular measure. The further suppression of guilds under his successor led to a considerable change in the feeling of the citizens, many of whom, but for the religious persecution under Queen Mary, would have been very willing to return to the old faith.

The guilds had for centuries been an integral part of the social life of the citizens. The municipal guild, or what we know of it, has already been mentioned. At an early period after the Conquest we hear of 'trade guilds,' that is, of combinations of men of one calling for religious and other purposes. The many attempts made of late to distinguish between trade guilds and religious guilds have ended in failure, for all guilds were religious, and most religious guilds were trade guilds as well. As time went on the governing body occasionally found it convenient to consult a trade guild on the regulation of their particular business. This was especially the case under such mayors as Walter Harvey (1271-72), who, indeed, made an endeavour to enrol every citizen under the banner of a guild of his trade, and to formulate rules for each. Though he failed, his ideas took root; and in a few years many of the guilds obtained royal charters forming them into companies, able to hold lands, and in some cases, as that of the goldsmiths and that of the fishmongers, to regulate the conduct of their respective trades. The old guilds were thus generally merged in the companies whose governing bodies acted as trustees of the funds of the guilds. There was probably a good deal of confusion between the guild property and the companies property, but for the most part that of the guild could be distinguished, because it was applied to religious purposes. The act which confiscated these funds made, of course, a profound impression on the city. Some companies were wholly ruined, having perhaps no funds but those which might be applied to a 'guildable use;' and others, more prosperous, found it expedient, and even necessary, to sell their company estates in order to buy the guild estate which they had administered. The companies which recovered from this heavy blow prospered for the most part eventually, and those now extant deal with large charitable funds and hold large estates, to the great benefit of their tenants and their pensioners.

Under Queen Elizabeth the work of the Reformation was continued and completed. The history of the church in London was greatly complicated with that of the municipality. We have seen that the bishop was an alderman; but at a very early period, a period in fact so early that no record of its date survives, the ecclesiastical and lay administrations drifted apart, and the church had less and less concern in the affairs not strictly religious. There are historical reasons for believing that St Paul's was at first a parish church, but before the end of the 12th century, perhaps as a consequence of the great fire of 1136, the parochial arrangements of the whole city were readjusted, new parishes were formed and their boundaries marked, and a great number of new churches were built. The dean and the lordly canons of St Paul's no longer cared to have the common people worshipping in their church, and built St Peter-le-Queene, at the corner of Cheap, with St Gregory and St Faith closely adjoining St Paul's, the one at the east end, the other at the west. The canons of St Martin's built St Vedast's, and the friars of Newgate Street St Ewen's; and private individuals or wealthy aldermen increased the number of churches as long as they could obtain parishes to attach to them.

When land failed for this purpose, they founded chantries, some in St Paul's, some in other monastic and parochial churches. No doubt the act *Quia Emptores*, which in 1290 practically forbade the subdivision of manors, had its influence in restricting the multiplication of churches, but the number of city parishes (114) was out of all proportion to the population, great comparatively as that must have been; and, since churches were built rather as chapels where mass might be celebrated than for any other purpose, the later Puritan and Protestant idea, that they should be places where a large number of people could listen to sermons, had no influence on their dimensions. Although there was no abbey in the city, if we except St Mary's in East Smithfield, a Cistercian house founded by Edward III., and sometimes called Eastminster, which never flourished, the number of priories, colleges, and hospitals was immense. The Whitefriars had a large house on the south side of Fleet Street in the western suburb. The Blackfriars occupied the south-western corner of the city, and had leave to divert the course of the wall between Ludgate and the Thames. The Greyfriars were within Newgate, on the site now occupied by Christ's Hospital. Close to them was St Martin-le-Grand, a very ancient foundation for canons, which, in the later years of monasticism, having fallen into decay, was attached to Westminster Abbey. Close to the Franciscans on the north, but without the wall, was the Austin Canons' house in Smithfield. Elsing Spital was within Cripplegate. The Austin Friars had great buildings near Moorgate, and St Helen's Priory, for nuns, occupied the eastern side of Bishopsgate Street. The canons of the Holy Trinity held Aldgate, and south of their priory was that of the Crutched Friars. The suburbs teemed equally with religious houses, and there were several minor foundations within the city. The number of mass priests attending altars in St Paul's alone was reckoned at over one hundred; and the great pestilence of 1348 added largely to the chantries and chapels. In the 15th century this state of things became an intolerable burden, and contemporary literature is full of complaints. Unfortunately, in abolishing monasticism the beautiful churches of the monks and friars were not respected, and although one or two were named as worthy of preservation as preaching-houses, all perished except a portion of Austin Friars and the nuns' aisle of St Helen's. The Austin Friars' church, wholly disguised under a mistaken idea of 'restoration,' still remains as a Dutch church. Even St Paul's was mutilated: the campanile and the cloisters known as Pardon Churchyard were ruined; and after the destruction of the lofty spire, 520 feet high, by fire in 1561, the whole church fell into a very dilapidated condition.

The influence of the church told also upon London in another way. The addition of suburbs to the city as 'wards without' was prevented by the ring of ecclesiastical estates which gradually closed round it. On the east was Stepney, a manor belonging to the bishop. The mayor and corporation obtained a lease of the manor of Finsbury from a prebendary of St Paul's in 1315, and held it till 1867, when it was taken up by the Ecclesiastical Commission. To the westward there were several prebendal manors, and outside Temple Bar was the great parish and manor of St Margaret, Westminster, which belonged to the abbey. Southwark was annexed to the city in 1327, and was made a 'ward without' in 1550. But in addition to Portpool (now Gray's Inn), St Pancras, Ruggmere (now St Giles's), and Bloomsbury, the Moor (or Mora), at Cripplegate, Isling-

ton, Hoxton, and Eald Street (now Old Street), St Luke's, all of which were manors belonging to canons of St Paul's, the Knights of St John had Clerkenwell; the canons of St Bartholomew, Canonbury; the abbey of Barking had Tyburn, or the eastern half of the parish of St Marylebone; the Knights of St John had the western half, or Lylloston; the abbey of Westminster owned Paddington and Westbourne; and the abbey of Abingdon, Kensington. Finally, the abbey of Westminster held Chelsea for a time. It will be seen that every extension of the city jurisdiction was effected with great difficulty, and the effects of the division of the monastic estates by the Tudor dynasty did not greatly benefit the city, which in fact only obtained St Bartholomew's Hospital and the Grey Friars' from Henry VIII., and Bridewell from Edward VI.

The accession of Queen Elizabeth gave a considerable impetus to London trade. Her reformation of the coinage was only one item of a settled policy; and the Merchant Adventurers, chartered by her father, now stepped into the place previously occupied by the Germans of the Steelyard, which was abolished at the instance of the famous Gresham. The last charter of Queen Elizabeth was granted to the East India Company. The silk manufacture, driven out of Flanders by the cruelties of the Spaniards, was naturalised in England; and even the short-sighted policy of the first Stuart could not repress the rapidly-growing enterprise of the Londoners, whom the discovery of America and of a sea-passage to India stimulated to greater and greater exertions.

While the wealth and population of London thus increased during the 16th and part of the 17th century, the city itself became less and less fit for habitation. Its unhealthiness was partly caused by the deficiency of the water-supply, partly by overcrowding. The plague scarcely ever left its narrow streets and filthy alleys. The sanitary arrangements of the time of Edward I. were scarcely suited to the needs of the time of James and Charles. But, known only to a few Londoners, Sir Hugh Myddelton, by bringing clean water to the city in abundant quantity, bestowed upon it the greatest possible boon. This was in 1620; but some forty or fifty years elapsed before the New River was made generally available. In the meantime the citizens were overwhelmed with one great misfortune after another. James I. had reverted as far as he could to the mistaken policy of such kings as Henry III. and Richard II.; but it was reserved for Charles I., after a long series of high-handed proceedings, to seize the money of the city goldsmiths deposited in the Tower. His downfall was certain when the city turned against him; but, except for a very brief period, the Commonwealth found little favour in London, and Cromwell imposed one humiliation after another upon the citizens. Charles II. was warmly welcomed, and it was mainly owing to the co-operation of the wealthy merchants with Monk that his return was possible. But Charles followed in the footsteps of his father. Extortion and oppression were the instruments of his policy, and in 1672 he closed the Exchequer, and ruined nearly all the London bankers at a blow. He never afterwards was able to win the confidence of the citizens, on whom two other disasters of even greater vehemence had already come, the Great Plague of 1665 and the Great Fire of 1666.

There had been many previous visitations of the plague, and to that of 1625, long known as the Great Plague, 35,000 deaths were attributed. But the epidemic of 1665 threw all others into the shade. It commenced at St Giles's, in the suburbs, and the official statements enumerated the deaths

during the year at 97,306. As the population was reckoned at about 500,000, it will be seen that nearly a fifth perished.

There had also been many great fires, but that of 1666 exceeded them all. It commenced on the 2d September, at 1 o'clock A.M., in Pudding Lane, and raged for five days. It was estimated that 396 acres of houses were destroyed, fifteen city wards were consumed utterly, and eight others damaged, comprising 400 streets, 13,200 private houses, 88 churches and St Paul's Cathedral, and 4 city gates. The loss in mere money was estimated at about 4 million. It took London many years to recover from this terrible misfortune. Sir Christopher Wren built a new St Paul's, and also gave us St Stephen's, Wallbrook (until 1888, when it was in great part ruined by the parochial authorities), the chief monument of his powers after the cathedral, the spire of St Mary-le-Bow in Cheapside, and many other beautiful buildings, including the Monument, set up near where the fire began. This is a Tuscan Doric fluted column 202 feet high. St Paul's has a dome 404 feet high and 145 feet in external diameter; the length of the building east and west is 500 feet. Street, commenting on the superiority of St Paul's to St Peter's as an architectural composition, says: 'The great magnitude of the latter may strike the vulgar eye with admiration in the contrast; but the rudest taste must appreciate the surpassing merit of the former in the form and arrangement of the cupola and the noble peristyle' (see WREN). It contains many memorials, the best of which are Wellington's, in the Consistorial Court, on the south side of the nave, by Stevens; Lord Melbourne's, by Marochetti; and a recumbent figure of General Gordon, by Boehm. In the crypt are buried Lord Nelson (1805), Reynolds (1792), Turner (1851), Wellington (1852), Landseer (1873), and Wren himself (1723). The Exchange (q.v.) of Sir Thomas Gresham was burned, rebuilt, and then burned again, and finally rebuilt in 1844 by Sir William Tite. The Guildhall, partly of the 13th century, partly of the 15th, which had been the scene of so many historical events, was damaged in 1666, but not destroyed, and was handsomely restored first by Jarman, an eminent contemporary of Wren, and more recently by Sir Horace Jones. Among the churches spared by the fire is St Bartholomew's, in part, a fine Norman structure; St Giles's, Cripplegate, built 1545, in which John Milton (born in Bread Street, 1608) was buried, 1674; St Helen's, Bishopsgate, full of fine monuments; St Katharine Cree, said to have been designed by Inigo Jones, 1631; and St Andrew Undershaft, in which is Stow's monument.

During the rest of the reign of Charles II. and the whole of that of his successor, the city and the court were more or less at variance; and in 1683 Charles took London, to use the old phrase, into his own hands. The Lord Mayor was deposed, the charter was seized, and both aldermen, and also a so-called Lord Mayor, in reality a warden, were appointed by the king. At first James II. carried on his brother's policy towards the city. At the news of the landing of the Prince of Orange the charter was sent back, but the concession came too late, and the judicial murder of Alderman Cornish was too fresh in the minds of the citizens. In December 1688 they formally petitioned William to assume the crown, and in a few hours found ample funds for his use. Subsequent events were largely influenced by the city, and it has often been observed that the opposition of London, in old times fatal to a king or his family, has of late equally affected the fortunes of a ministry. King George III. was galled by the supremacy of the citizens as Henry III. had been before him; but

he made no way against them. The last events that need be noticed here are the establishment of the Bank of England in 1694; the removal of the old wall and its gates in 1760; the clearing of the houses from London Bridge about the same time, and its complete rebuilding in 1831, when it was only one of a large number of bridges. A great number have been built since then; the latest addition, a bridge below the Tower, is an engineering work of great importance, which will add greatly to the picturesque aspect of the east of London. See BRIDGE, Vol. II. p. 416.

The population of the city has dwindled year by year, and especially since the multiplication of railways. Few tradesmen now live in their place of business, and the difference between the number of people who actually reside within the ancient boundaries and of those who only come in to business is immense. In 1881 there were 6493 inhabited houses and a population of 50,526; but 25,143 houses were used during the day, when the population rose to 261,061. The rateable value of property was, in 1887, no less than £3,767,000. Meanwhile the suburbs have spread in all directions, and the houses of Londoners are found in Berkshire, Buckinghamshire, Hertfordshire, and Sussex, as well as in Kent, Surrey, Essex, and Middlesex.

The city has its own police force, in six divisions, with seven stations and two courts—one at the Mansion House, the official residence of the Lord Mayor, and one at the Guildhall. Several railway stations have been made within the precincts of the city, as the Temple, Blackfriars, the Mansion House, the Monument, and Mincing Lane on the Metropolitan Railway, with Cannon Street Terminus, which stands exactly on the site usually claimed for the Roman pretorium. The diocese of London has varied very frequently in extent, having at one time comprised Middlesex, Essex, and Hertfordshire, besides the city. It now consists of the city with Middlesex, and that part of the new county of London which was formerly reckoned in Middlesex. The bishop resides in Westminster, and at an ancient manor house of the see at Fulham. There is a dean of St Paul's who resides close to his church, on the site of the old brewhouse of the chapter. He is assisted by four residentiary or stagiarj canons, and by a precentor, a chancellor, and two archdeacons, and there are thirty canons of the old foundation, now usually called prebendaries, and a college, incorporated by Richard II., of minor canons.

London formerly returned as many as six members to parliament, of whom two were supposed to be on duty at a time. From about 1357 the number was usually four. Under the Reform Act of 1885 it was reduced to two.

Like other ancient towns the city of London had its own customs, some of which still have the force of law. Thus, by the custom of London, every shop is deemed an 'open market' for the goods usually sold there. There were also special rules as to the prosecution of certain classes of offenders, &c. The London custom which governed the succession to personal property was taken away in 1856. There is a customary right of foreign Attachment (q.v.).

THE COUNTY OF LONDON. Under the Local Government Act of 1888 a new county was defined, to consist of the suburban parishes of Middlesex, Surrey, and Kent. These parishes, or a great part of them, had previously been described in certain acts as 'the Metropolitan Area,' a term quite inappropriate. By the Act of 1888 a county council was provided for this district, and the jurisdictions formerly existing of the city of London, and the authorities of the three counties were abolished. Before describing the new county we may point

out that under this act the county of Middlesex (q.v.) was removed from the sheriffship of the citizens, and divided, one part forming a new county of Middlesex, and the other, united with parts of Surrey and Kent, forming the new county of London. The work of the County Council has been multifarious and far-reaching, and has evoked a corresponding amount of criticism. By the London Government Act of 1899 the administrative county of London, with the exception of the City, which had heretofore been under the authority of more than a hundred and twenty local authorities (vestries, district boards,

burial boards, &c.), was reorganised into twenty-eight municipal boroughs, each under a municipal council. These boroughs are: Battersea, Bermondsey, Bethnal Green, Camberwell, Chelsea, Deptford, Finsbury, Fulham, Greenwich, Hackney, Hammersmith, Hampstead, Holborn, Islington, Kensington, Lambeth, Lewisham, Paddington, Poplar, St Marylebone, St Pancras, Shoreditch, Southwark, Stepney, Stoke Newington, Wandsworth, Westminster, Woolwich. The councils have all the power and duties of the old vestries and district boards and some of those of the London County Council. The suburbs form a ring round the city, and the

efforts of the medieval rulers were directed—first, to restricting as much as possible their growth; and secondly, to bringing them, when they were settled, under the control of the city. In this policy the Londoners were unsuccessful. The suburbs grew in spite of city and parliament; and by 1222 a continuous street united Westminster with London; another stretched beyond the Tower to Stepney; and a third, flowing out of Bishopsgate, reached northward to Islington. In the same 13th century the city made its final attempt to keep the suburbs under control. A great 'ward without' was formed westward, extending to the Temple and Holborn Bars; and, on the north, part of Moorfields was made a 'ward without' in the jurisdiction of the alderman of Bishopsgate. But, except for the formal addition of Southwark in Surrey, made

in 1327, confirmed and defined in 1550, no further extension of the city liberties took place. The estates of the church stopped the way. London was surrounded by manors, of which ecclesiastical dignitaries and monastic bodies were the lords. Foremost among these were the canons of St Paul's and the Bishop of London. Stepney, an immense parish to the eastward, belonged to the bishop, all that is, except such parts of the precinct of the Tower as were taken out of it. On the west the Abbot of Westminster had the parish of St Margaret, which at first came up to the Fleet, at what we know as Ludgate Circus, and was with difficulty pressed back beyond Temple Bar. The abbot continued to hold the churches in the new ward, and the dean and chapter still present to St Bride's, Fleet Street. On the north, the canons

of St Paul's held Cantler's, now Kentish Town, Eald Street, Hoxton, Islington, and St Pancras, while Mora and Wenlocksborn were parts of the parish of St Giles, Cripplegate. Other canons, monks, and friars, and the Knights of St John and of the Temple had holdings in Smithfield and Canonbury, at Clerkenwell and in St John's Wood, and in the Temple. All these church estates were in hands which bitterly resented any interference on the part of the city; and when the monastic orders were abolished, their estates were for the most part granted to individuals at least as tenacious of their independence. The canons of St Paul's had already for the most part ceased, owing to the prevalence of a corrupt system of leasing, to own except in name the manors of which they had been the lords. In the more distant parishes similar influences were at work, and except in Westminster, where the abbot and his successor, the dean, held the reins of local government, the parishes of the so-called Metropolitan Area were governed by elected vestries and other such institutions, and the lands were divided and parcelled out in freeholds, some large and a few small, among owners who had little general control or influence.

The precinct of the Tower, eastward of the city wall, was formed partly by aggressions on the

Lady Jane (Grey) Dudley lived, is in good preservation, but is now, for some unknown reason, called the Queen's House. The Beauchamp and Devereux towers seem to have held the most illustrious prisoners; they, with the Bell Tower, in which Fisher, Bishop of Rochester (1534), and Mary, Countess of Lennox (1565), were confined, form the western side of the inner ward, being united by a curtain wall, on which the prisoners walked. Unfortunately, the inscriptions from many different chambers have been brought together in the principal room of the Beauchamp Tower, by which their historical significance has been in some cases wholly lost. Here we see, among others, memorials of the incarceration of the six sons of John Dudley, Duke of Northumberland (beheaded 1553). Of them, John, the eldest, was released and died; Ambrose, the second, became Earl of Warwick, and lived till 1599; Guildford, the third, was beheaded on the same day as his wife, 12th February 1554; Robert, the fourth, is best known as Queen Elizabeth's Earl of Leicester, and died in 1588; and Henry, the youngest, was killed in the French wars in 1558. Other illustrious prisoners were Edward, Earl of Warwick, called the last of the Plantagenets, beheaded 1499, and his sister Margaret, Countess of Salisbury, beheaded 1541; Edward Seymour, Duke of Somerset, beheaded 1552; Sir Thomas More, 1535; Thomas Cromwell, Earl of Essex, 1540; Queen Catharine Howard, 1541; Henry Howard, Earl of Surrey, 1547; Henry Grey, Duke of Suffolk, 1554; Sir Walter Raleigh, beheaded at Westminster in 1618; Thomas Wentworth, Earl of Strafford, 1641; William Laud, Archbishop of Canterbury, 1645; James Scott, Duke of Monmouth and Buccleuch, 1685; James Rueliffe, Earl of Derwentwater, 1716; and the Scots lords implicated in the risings of 1715 and 1745—Kennure, 1716; Kilmarnock and Babmerino, 1746; and Lovat, 1747. Many of these prisoners were buried in St Peter's Church, which having been burned in 1512 was rebuilt in time to receive the bodies of Queen Anne Boleyn and other victims of the Tudor times. It was 'restored' some years ago in a very thorough manner, every vestige, except some

The Tower of London from the River.

citizens, partly by acquisitions from the lord of Stepney, and partly by reclamations from the Thames. Two bastions of the old wall, generally called Roman, and certainly dating back to the reign of Alfred (see above, p. 696), were removed, and the White and Wakefield towers were built on them. They were fenced round by a palisade at first, but by the end of the 12th century the precincts comprised 26 acres, about 12 being covered with buildings. Gundulf, a monk of Bee, designed the White Tower, begun in 1078. The works went on steadily, the chapel of St John in the White Tower being supplemented by the parish or precinct church of St Peter 'ad Vincula' on the Green in the reign of Henry II. The keep is approximately in the centre, and is surrounded by walls and towers forming the inner and outer wards. The towers of the inner ward were those chiefly used for prisoners' lodgings, but a complete royal palace was in the south eastern corner. Of this palace, from which Queen Anne Boleyn went to her death on the adjoining green, scarcely a vestige remains. The lieutenant's lodgings, where, or in the chief warder's house next door,

monuments, of the period which witnessed these sad scenes being carefully obliterated. The crown jewels were long kept in the Brick Tower, at the north-eastern corner, but in 1867 were removed to a chamber in the Wakefield Tower. This chamber, in which they are now exhibited, has shared the fate of the chapel, every vestige of its occupation by Henry VI, probably at the very time of his death, having been carefully 'restored' away. The great collection of armour, founded by Henry VIII, in his palace at Greenwich, is on the upper floor of the White Tower. Two or three pieces date from before the time of the Tudors. The ticket-office, by which the visitor enters the fortress, is on the site of a menagerie which dates back to the time of Henry I, whence the saying 'to see the lions,' meaning to visit the Tower. The principal feature of the outer ward is St Thomas's Tower, or the Traitor's Gate, facing the Bloody or Garden Tower, the entrance of the inner ward. The view of the Tower from the westward is much interfered with by the new bridge, but, except for some ugly barracks and the demolition of the palace, has still very much the aspect it bore in the 17th century.

The new bridge just mentioned starts from the boundary between the precincts of the Tower and that of St Katharine's Hospital, an institution founded by Matilda, the queen of Stephen, and refounded in 1273 by Eleanor, queen of Henry III. It still subsists, having been spared at the Reformation, but was removed in 1827 to the Regent's Park, and St Katharine's Dock made on the old site. A little farther east, still on the Thames bank, we come to one of the numerous divisions, known as the Tower Hamlets, into which the original parish of Stepney has been parcelled. This used to be Ratchiff and Wapping, but has long been known as St George's in the East. Next to it is Limehouse, a name whose original form, Limehurst, sufficiently denotes the old character of the region. Next to Limehouse is Poplar, which includes the Isle of Dogs, a kind of delta formed by the river Lea, which derives its name from its docks. Farther inland are Bethnal Green, a vast district, chiefly covered with factories and with the houses of the lower class of artisans and labourers. Mile End, Old and New Towns, whose names show their situation on the great eastern road made through Aldgate (see above) in the 12th century, which led to an arched bridge, locally known as the Bow, where there had previously been only the dangerous Stratford over the Lea. These parishes, with Whitechapel north of the Tower, form a complete ring round Stepney, where an ancient church, dedicated to St Dunstan, still stands among surroundings very different from those which marked the district when the bishops of London had a palace here, with wide parks, and the noble hunting grounds of Hackney and Hornsey on the hills beyond; when Edward I. held a parliament in 1299 at the house, near the church, of the mayor, Henry le Waleys; when the good Dean Colet had a country house here, where he was visited by More and Erasmus; and when Bishop Ridley, the martyr, surrendered the manor to Lord Wentworth, the same whose loss of Calais is said to have been the proximate cause of the death of Queen Mary I. Since Wentworth's death the estate has been divided among many owners, and there are few traces of antiquity anywhere. The Bethnal Green Museum of the Science and Art Department is in a style not likely to improve the architectural taste of the neighbourhood, but has housed and exhibited various fine collections of pictures and works of art. Much of Hackney, which adjoins Stepney on the north, has been kept open; an old park of the bishops being now laid out as Finsbury Park, and the commons and fields eastward to the Lea having been rescued from the builder. South of this district, which stands high, are Haggerston and Hoxton, densely populated parishes, comprising the ancient Shore-ditch, and reaching to the city wall. Westward are the two divisions of Finsbury, St Luke's and Clerkenwell. In St Luke's was the 'Artillery Ground,' or place of exercise for volunteer bowmen, from which the modern Artillery Company took its rise. In Clerkenwell, but not strictly speaking of it, is the Carthusian monastery, now a kind of refuge for decayed gentlemen, known as the Charterhouse. Here was formerly a school, in which John Leech was educated as well as Thackeray, who describes the place under the name of the Slaughterhouse. In the Liberty of Saffron Hill was a palace of the bishops of Ely, and their chapel, a beautiful building sold to the Roman Catholics in 1874, still exists in Ely Place. Clerkenwell, the site of the house of the Hospitalers, has still its St John's Gate, with memories of Dr Johnson. Northward and westward, we come to a group of old prebendal manors. Islington has a very ancient history

extending back to the time of the Conquest; Stoke Newington with a curious old church and a new one; St Andrew's, Holborn, in which Lord Beaconsfield was baptised, and in the cemetery of which, in Shoe Lane, Chatterton was buried in 1770; Portpool, the original name of the ground now covered by Gray's Inn, whose great ornament was Lord Bacon; and Rugmere, now known as St Giles's and Bloomsbury. The last named district, in which the British Museum is situated, was brought by the good Lady Rachel Wriothesley to her second husband, William, Lord Russell (beheaded in Lincoln's Inn Fields in 1683), and still belongs to her descendants, the dukes of Bedford. The celebrities of Bloomsbury have been too numerous to mention; but we cannot forget Richard Baxter, who lived in Southampton, now Bloomsbury Square; Charles Dickens, who lived long in Gower Street and in Tavistock Square; and Charles Lamb, who lived in Little Queen Street.

In St George the Martyr, a small parish taken out of Holborn, is Queen Square, called after Queen Anne. Macaulay lived at 50 Great Ormond Street while he was a boy. St Giles's, long a rookery of wretched tenements, has been greatly cleansed and improved of late, but the too famous Seven Dials continue to deserve an evil reputation. Some of the streets and squares of the district were places of repute two centuries ago. Nell Gwynn lived in Wardour Street, the Duke of Monmouth in Soho Square, Dryden in Long Acre and in Gerard Street. The small parish of St Paul, Covent Garden, boasts of a church designed by Inigo Jones, of the greatest vegetable and flower market in London, and of innumerable literary associations. In Bow Street was Wilks's Coffee-house, where Pepys met Dryden; Turner, the landscape-painter, was born in Maiden Lane; Charles Lamb lived in Russell Court; and Pope, Sheridan, Butler, and Prior are among the names we meet with in the history of the locality.

We now reach the Strand. Beginning at its eastern end, next to Temple Bar, we have the colossal buildings of the New Law Courts (1874-82), of which George E. Street was the original designer; but so thwarted by meddling authorities, that only the best features, such as the noble hall (238 feet long) and the tower, can be considered his. North of the courts is Lincoln's Inn Fields, the largest square in London. Here is situated the College of Surgeons, with its museum, and the museum of Sir John Soane. Close to the Law Courts is the church of St Clement Danes, by Wren, in which a brass tablet marks the seat habitually occupied by Dr Johnson. On the south side are Arundel and Norfolk streets on the old site of Arundel House. Essex Street commemorates the residence of Queen Elizabeth's unfortunate favourite in the Outer Temple. A brook ran through Milford Lane, and in Strand Lane is a bath of Roman origin. Next, to the westward, we come to the charming little church of St Mary, by Gibbs, and to Somerset House, now full of government offices, built by Chambers (1786), after a design of Inigo Jones. Here Anne, queen of James I., resided. The name is derived from the Duke of Somerset (beheaded 1552), who built a house here. The streets on the north side compete with Fleet Street as the headquarters of periodical literature. Before we reach Waterloo Bridge (see *BRIDGE*) we are in the precinct of the Savoy, continuous with a manor granted by Henry III. to Peter of Savoy, uncle of Queen Eleanor. Here John of Gaunt resided till the palace was burned by the rioters of 1381. Chaucer, who married a sister of the duke's third wife, was much here. It afterwards became a hospital, of which the chapel,

dedicated to St John the Baptist, only remains. In it Gavin Douglas, Bishop of Dunkeld (died 1522), lies buried. Fuller officiated here during the reign of Charles I. The hospital was suppressed in 1703, and the chapel made 'royal' in 1773.

The Thames Embankment (1864-70) borders the Strand from the city round a great bend of the Thames at Charing Cross to Westminster. When we pass the city boundary near the Temple, we are abreast of the building of the London School Board, by Mr Norman Shaw, R.A., next to which, with a short interval, is the river-front of Somerset House, by Chambers, one of the best elevations in London. Gardens beautifully laid out conduct us past the Savoy, the Adelphi Terrace, an Egyptian obelisk bearing the names of Thothmes III. (18th dynasty) and Rameses II. (19th dynasty), and the old gateway which marks the site of Buckingham or York House, where Bacon was born in 1561. Charing Cross station occupies the site of Hungerford Market. The cross in the court toward the Strand is believed to be a copy of the Eleanor Cross erected by Edward I. The statue of Charles I. stands on its exact site. Northumberland Avenue was made in 1874 over the site of the last of the great riverside palaces with which the Strand was formerly lined on the south. Trafalgar Square is on the site of the old King's Mews. Its chief ornament is the church of St Martin 'in the Fields,' by Gibbs (1726). The National Gallery is a poor building (by Wilkins, 1838). The National Portrait Gallery behind it was opened in 1895.

The monumental Corinthian column to Nelson is very conspicuous, with four lions by Landseer at its base. Behind it is a statue of General Gordon by Thornycroft. There are other statues, all poor. For Whitehall, see WESTMINSTER. A statue of George III., by Wyatt, is in Cockspur Street, which leads us past the Haymarket and its great opera-house to Waterloo Place, where is Bell's Guards' Memorial, a very poor figure of Victory in bronze, the Duke of York's (Tuscan red granite) column with statue by Westmacott; and monuments, mostly very bad, to Franklin, Lord Clyde, Lord Lawrence, &c. The clubs in Pall Mall are in many cases justly admired, and, except those most recently built, are in good proportion, especially the Reform, designed by Barry, and the Carlton, by Smirke, and give a stateliness to the street, sadly wanting as a rule in London. At the War Office is part of Schomberg House, occupied by Gainsborough, the painter. When we reach St James's Palace (in Westminster) we turn up St James's Street, noting at the corner a beautiful insurance-office by Mr Norman Shaw. Opposite, on the west side, are several well-proportioned clubs, but some new buildings, covered with ornament, intended apparently to conceal weak designs, go far to spoil the view. Near the top of the ascent are White's, Boodle's, Brooke's, and Arthur's clubs, all celebrated in the social annals of the century, and on the site of Crockford's, the Devonshire. In Bennett and Arlington streets we are reminded of one of the members of the Cabal. Lord Salisbury's obtrusively ugly house looks on the Green Park. In Arlington Street resided another prime-minister, Walpole, and afterwards his son, Horace Walpole.

Piccadilly begins a little to the eastward of Waterloo Place (see above) and its continuation Regent Street, and is called from a kind of teagarden, Piccadillo Hall, which stood where the Criterion is now. The formation of Regent Street, which was to lead from Carlton House (where the York column now stands) to the Regent's Park, which was beautifully laid out on the old Marylebone common, must be ascribed to Nash, to whom must also be assigned the street fronts, often very beautiful, although executed only in

stucco. In the Regent's Park are situated the Zoological and Botanic Gardens. In Piccadilly there are still some fine palaces, as Devonshire House, Northampton House, the residence of Lord Rothschild, and Apsley House, but the finest of all, Burlington House, has been altered and added to in a wretched style, and the architect-earl's design can hardly be made out. Here are lodged the Royal Academy, the Royal, the Antiquarian, the Linnean, and several other learned societies. The gardens are covered by the exhibition rooms of the academy, and by the offices and theatre of the university of London, in a very debased style, overloaded with ornament. The only church in Piccadilly is St James's, the parish having been taken out of Westminster in 1684. It was built by Wren, at the expense of Jermyn, Earl of St Albans, who is generally believed to have been the second husband of Queen Henrietta Maria, and who is commemorated in the adjoining Jermyn Street. The exterior is plain, but the interior is the model and criterion of what a Protestant church should be.

Northward and westward is the great parish of St George, Hanover Square, separated from Westminster in 1724, which comprises Mayfair, Grosvenor Square, and Belgrave, extending from Oxford Street on the north to the Thames on the south. It contains many churches, more or less dependent on St George's, but though some of them are very costly, not one calls for separate mention. The mother-church is heavy in design, except the portico. It is by John James. The parish nearly all belongs to the Duke of Westminster, whose ancestor, Sir Richard Grosvenor, married in 1676, Mary Davies, the heiress of two city families, by which these then open fields had been acquired, not without litigation, in the reign of Queen Elizabeth. The whole estate consists of an almost circular portion around Grosvenor Square, extending along Oxford Street from Davies Street to Park Lane, and bounded on the east by the water-course of the Tyburn; and a southern portion, bounded on the west by the Westbourne, which divides it from Chelsea, and on the east by Grosvenor Place, Vauxhall Bridge Road, and some irregular streets down to St George's Square, which is on a site named in a map of 1723, as 'Mr Weston's garden.' The new churches on this magnificent estate are typical of the other buildings. There is not one which can be named as of good, or even tolerable, design. Belgrave Square and Eaton Place, and the adjacent region are all in stucco. Grosvenor Place is in a French style, very debased. Dorchester House, not on, but bordering the estate in Park Lane, is handsome, having been designed by its owner with the assistance of Vulliamy. In Stanhope Street is Chesterfield House, much pulled about, but still fine, and worthy of its designer, Ware. Grosvenor House has few architectural features, but the picture-gallery in Park Lane is in a fair classical style, and the screen in Grosvenor Street has been admired.

Of St Pancras, large as the parish is, there is very little to be told. It contained, apparently, several of the manors of the canons of St Paul's, and a curious little church, much injured by modern, and indeed recent, restorations, shows Norman features. It is close to the St Pancras terminus of the Midland Railway, and is well worth a visit for the sake of the graveyard adjoining, which, though much curtailed by the railway, still comprises some interesting monuments, those, for example, of the Greys, lords of Portpool, now Gray's Inn; of Walker, the lexicographer; and of Sir John Soane. Many refugees during French and Italian troubles were buried here. In the parish is Kentish Town, the old prebendal manor of 'Cantler's' or Cantelupe's, called after an

ancient canon, and now the estate of Lord Camden. Somers Town used to belong to the family of Somers Coorks. The new parish church of St. Pancras is a very conspicuous object in the Euston Road. It was built in what was thought to be a Grecian style in 1822, by the Inwoods. Another remarkable building is the Midland terminus with a hotel, by Sir G. G. Scott, one of the largest buildings of the kind.

Tyburn was anciently the name of the parish which we know as St. Marylebone. It presents some curious and interesting features. Unlike most parishes it seems never to have been contained in a single manor, but was divided before the dawn of history into two at least, if not three. This division, or inclusion, may have been caused by its remote and lonely situation. A brook ran through it, 'the bourne from which no traveller returns,' its source hidden among the wooded hills of Middlesex; and the little church of St. John was in 1400 pulled down because it had been so often broken into and robbed. A new church was built higher up the brook, where there were a few houses, and the place is still known from its new dedication, *St. Mary-le-Bourne*. The brook was known as the Tyburn, the earlier form of which points to a double stream, and the original church probably stood on a kind of island, a site now covered by the bookseller's shop of Mr. Bumpus. The eastern part of the parish formed the manor of Tyburn, and belonged to the abbey of Barking. It was leased out to various people, and in the 15th century was held by Thomas Hobson. Henry VIII. held the manor, and Queen Elizabeth granted it on lease to Forest, who in the succeeding reign bought it. His descendants sold it to John Holles, Duke of Newcastle, for £17,500, and it has ever since descended in his family, Lady Ossington being the present owner. The western part of the parish was the manor of Lilleston, now commemorated in Lisson Grove, and descended much like the eastern half, through lease-holders, who held from the Knights of St. John (whence St. John's Wood), down to Sir William Portman, whose descendants now own the greater part of it. The western boundary is the Edgware Road. The place of execution for the city of London and the county of Middlesex was at first by the burnside, where in 1330 Roger Mortimer, Earl of March, was hanged. As the suburbs increased and crept towards St. Marylebone, the gallows were removed farther west. In 1512 they stood in the adjoining manor of Lilleston, close to the modern Marble Arch, and eventually they were set up for each execution at the foot of Edgware Road. A house, recently rebuilt, the New Inn, is pointed out as the place where the stout beams of the triangular gibbet were kept. At one or other of the places thus indicated, the Holy Maid of Kent (1534), many priests in the reign of Elizabeth, Felton, the assassin of Buckingham (1628), Jack Sheppard (1724), Jonathan Wild (1725), Lord Ferrers (1760), Mrs. Brownrigg (1767), and the Rev. W. Dodd (1777) were hanged, with an innumerable company of less notable criminals. The last execution here was that of John Austen (1783). It may be worth while here to note that Tyburnia is not in Tyburn, nor yet in Lilleston, but in Paddington. The number of eminent inhabitants and natives of St. Marylebone is very great. Hogarth represented the church, now a parish chapel, in his *Rake's Progress*. Gibbs, the architect, Gibbon, the historian, Hoyle, who wrote on games, and Charles Wesley, the hymn-writer, may be mentioned as having lived or died in the parish. Besides these, we must not omit the Harley family and their famous collection of MSS. now in the British Museum; Oxford Street is called after Edward Harley, second Earl

of Oxford and Mortimer, who married the Holles heiress.

North of St. Marylebone is Hampstead (q.v.), with its splendid open heath, some parts of which are as much as 450 feet above the sea. Paddington lies wholly westward of the Edgware Road. It was early divided into two manors, Paddington and Westbourne, the latter named after a little stream the original source of the Serpentine. Both belonged to Westminster Abbey, but the eastern manor having been appropriated to the bishopric of Westminster, with most of the other estates of that short-lived see, went to the see of London, while Westbourne is still the property of the abbey. There is little of interest in either division. The Great Western Railway and its terminus cover a large part of both, obliterating Westbourne Green where Mrs. Siddons once lived. A small part of Kensington Gardens is in Westbourne, and in the adjoining manor is a cemetery which belongs to St. George's, Hanover Square, and contains the grave of Lawrence Sterne.

Westward of Kensington (q.v.) is Hammersmith, a populous suburb, taken out of Fulham, which reaches down to the Thames, and forms the western extremity of the county. A very interesting church, St. Paul's, built here in 1631 by Sir Nicholas Crispe, has recently been pulled down, and a new church of great size, but otherwise unworthy of the site, has been built in its place. It is designed in a mock-Gothic style. In a better style are some nunneries and other institutions of the Roman Catholics.

Fulham boasts of an ancient church and of the so-called 'palace' of the bishops of London. The manor which is, or was, contemporaneous with the parish, has been the property of the see from time immemorial, and remains the one residential estate of the bishop. The house, which has sometimes been described as the oldest inhabited house in England, surrounds a courtyard. A chapel, consecrated by Bishop (afterward Archbishop) Tait in 1867, is adjoining the house in the grounds. The exterior is unnecessarily plain, but the interior is handsome. The house contains a hall built by Bishop Fletcher (1595), and the arms of Bishop Fitzjames (died 1522) are in the courtyard and in the garden, which lies very low but contains many fine trees and shrubs. The church of Fulham is very plain but contains a few fine monuments. In the churchyard are the graves of eight bishops. Close to them is a tomb which bears the name of Theodore Hook (died 1841), who had a house, now removed, in the village. Of late years the numerous pleasure-grounds and open spaces of Fulham have been covered with second-class houses, and we have but scanty remains of Parson's Green, North End, and other classical localities. Chelsea (q.v.) adjoins Fulham.

Crossing the Thames, we reach that part of Surrey which has been included in the new county. Battersea is chiefly remarkable now for the beautiful park, opened in 1852, close to which was the residence of Henry St. John, Viscount Bolingbroke (died 1751). Westward of Battersea is Wandsworth, south of it is Clapham, and beyond that Penge, in which is the Crystal Palace, usually called from the neighbouring Sydenham. All these are covered with streets, interspersed here and there with villas. Kewington, the site of a manor-house of the princes of Wales, Brixton a little farther south, and Norwood, on the summit of the southern line of hills which enclose what is called the London Basin, come next, and the manor of Lambeth faces Westminster. The archbishops at first rented the house from the see of Rochester, on account, no doubt, of its convenient situation. They finally acquired it by exchange in 1196. The

domestic parts of the house are modern, but the chapel was built about 1250, the 'Lollards' Tower,' 1440, the gateway, 1490, and the hall, now the library, in 1663. There are many beautiful MSS. and rare printed books in the library. The associations of Lambeth with the greatest men in England are too numerous to be detailed here, but we may remember that Bishop Parker (died 1575) is buried in the chapel, and that this was the scene of More's refusal to accept the king's supremacy. St Mary's parish church is close to the gate and contains monuments of archbishops Bancroft, Tenison, and Secker. Two modern buildings are very conspicuous at Lambeth—Doulton's terracotta factory, south of the palace, and St Thomas's Hospital, which unfortunately faces the Houses of Parliament, having been removed to this site in 1871 to make way for London Bridge station. The architecture is unusually ugly, even in London.

From this point eastward to Southwark (see above) the low peninsula, formerly submerged at every high tide, is occupied with mean streets and lanes, and with great warehouses, stores, and wharves; the only point of interest being that on which Shakespeare's Bank-side Theatre the Globe stood. The approaches to Waterloo Bridge probably cover the site. Eastward of Southwark are Bermondsey, where a fine and famous abbey flourished before the Reformation, of which nothing remains, and Rotherhithe, at an abrupt bend of the Thames. Both districts are densely covered with factories and labourers' dwellings. Farther inland and to the southward are Newington, Walworth, the immense parish of Camberwell, with Dulwich College and picture-gallery, and Peckham. All are densely populated, but present few objects of antiquarian or picturesque interest.

Eastward of Camberwell we enter those parishes which are taken from Kent. They comprise Lewisham, a good part of which is still open; Deptford, Greenwich, and Woolwich, which includes some fields on the north side of the Thames. There are many interesting sites in this district. At Deptford was Sayes Court, which John Evelyn lent to Czar Peter; Eltham Palace, with its ancient hall, built by Edward IV.; the Woolwich Academy, for Royal Engineers and Artillery; and Greenwich (q.v.), with its magnificent hospital and its park, and the observatory from which we and most civilised nations reckon longitude.

The commerce of the vast area thus briefly described is in great part carried on in the City; but the best retail shops are in the Strand, Regent Street, and Bond Street. The statistics of the cattle-markets are published at intervals, and show a constantly increasing demand and supply. The tonnage of the port now exceeds 6 millions, and the total trade exceeds 226 millions sterling. The rateable value of the whole county, including the city, amounts to over 30 millions sterling. The annual consumption of food includes 2 million quarters of wheat, 400,000 oxen, 1,500,000 sheep, 8 million head of poultry, 400 million pounds of fish, 500 million oysters, 180 million quarts of beer, 8 million quarts of spirits, and 30 million quarts of wine, besides coal to the amount of 6 million tons.

The following tables show some London statistics:

POP. IN VARIOUS AREAS IN 1891.

	Acres.	Pop.
City of London	608	37,694
County of London (with City)	75,412	222,118
London School Board District	"	"
Registrar-general's Tables of Mortality	75,331	4,211,056
Metropolitan and City Police Districts, 441,539		5,633,352

London within the Registrar general's district: (1800) 958,863; (1811) 1,918,417; (1861) 2,083,989; (1871) 3,254,260; (1881) 3,816,483; (1891) 4,211,056. Rateable value within Metropolis Management

Act: (1859) £12,045,476; (1869) £16,257,643; (1879) £23,960,109; (1889) £31,592,387. Miles of streets: (1801) 470; (1821) 610; (1841) 905; (1861) 1290; (1881) 1740. Houses: (1801) 130,000; (1881) 520,000.

	Imports of Foreign and Colonial Merchandise.	Produce of United Kingdom exported.	Foreign and Colonial Produce exported.
1855	£132,699,036	£50,517,252	£34,845,773
1886	128,008,767	46,125,495	34,455,430
1887	129,430,751	46,023,152	35,339,715
1888	138,183,465	50,211,258	37,572,768
1895	145,937,445	44,613,355	35,977,526

The customs revenue was: (1865) £10,942,913; (1885) £10,584,956; (1895) £9,479,788 (as against £3,030,405 at Liverpool). The total foreign trade of London is over a fourth of that of the United Kingdom, and is to that of Liverpool as £225,000,000 is to £187,000,000. For some industries London is more important than any other town in the kingdom. In 1891 there were 83,448 dressmakers, milliners, &c., in London, 52,346 tailors, 35,069 printers, and 31,867 cabinetmakers.

The death rate of London in 1855 was 24.3 per 1000; in 1881.90 it was 21.4; it is now little over 17. In London in 1891, 65 per cent. of the population were London born, and there were 59,390 persons of Scottish birth, and 66,465 of Irish birth. Of 95,653 foreigners, 26,920 were German, 12,034 Russian, 14,708 Polish, 10,366 French, 5138 Italian, 4903 American (U.S.), 4289 Dutch, 3041 Austrian, 2244 Spanish, 2044 Belgian, 1432 Swedish, 1011 Norwegian, 827 Danish.

London. UNIVERSITY OF. This title was originally assumed by the non-sectarian institution afterwards known as University College, London, the fine building of which, situated in Gower Street, W.C., was opened in the autumn of 1828. The functions of the college were confined to teaching; but in 1834 its promoters applied to the government of the day for power to grant degrees. Meanwhile, King's College (q.v.) had been founded by adherents of the Church of England; and it seemed not improbable that other colleges of similar character would be (as indeed they were) established. If, therefore, the degree-giving power had been accorded to University College, there would have been no excuse for refusing it to King's and other colleges. Hence, to avoid the multiplication of little universities, the government resolved to institute a body which should examine, but not teach, leaving the colleges to teach, but not examine—at least, not for degrees. A charter constituting such a body (the University of London) was issued by the crown on November 28, 1836, and this charter was up to that of 1863 (valid till 1900) followed by four others, as well as by two or three supplemental charters, varying the constitution or extending the powers of the university.

For the first twenty-two years of its existence the university comprised (a) the governing body, or senate, made up of a Chancellor, a Vice-chancellor, and thirty-six 'Fellows'; and (b) the affiliated colleges and medical schools. At first University and King's were the only affiliated colleges; but in twenty years the number of the arts colleges had grown to about fifty, and of the medical schools to nearly twice as many; and of each class only a small minority were in London. Almost a revolution in the university was effected by the charter of 1858 (of which the charter, dated 1863, and in force till 1900, was an amended form). Previously candidates for degrees in arts, although they might matriculate from anywhere, had been required to produce a certificate of two years' study at an affiliated college; but now this requirement was abolished, and candidates might acquire their knowledge when, where, and as they chose. The requirements from medical candidates, however, were not relaxed, and indeed were subsequently made more stringent. The same charter also introduced the graduate body, under the title of 'convocation,' into the constitution; and all masters of arts, all doctors, and all bachelors of a certain standing, upon payment of a trifling fee, became members of convocation. This body became the parliamentary constituency. Again, this charter instituted the Science faculty; and it took away from the fellows the power (which some of them had exercised) of acting as examiners. The chief organic changes between 1858 and 1899 were the institution of degrees in music and the opening of the university to women. The latter change was a gradual process; at first women were admitted to a series of special examinations under a supplemental charter of 1867; but under a later supplemental charter (1878) all the examinations and degrees, and all the exhibitions, scholarships, prizes, and medals were thrown open to them upon precisely the same conditions as to men. The field covered by the operations of the university may be described as imperial rather than local. Its charter declares it to have been founded for the benefit of all classes and denominations of Her Majesty's faithful subjects, without any distinction whatsoever, both in the United Kingdom and elsewhere. In conformity with the character thus professed, certain examinations were to be held at numerous provincial centres in Great Britain and at a few colonial centres. But the university itself originated none of these; they were instituted only upon the application of recognised authorities at the several centres.

This very feature, however, and the detachment of the university from the once affiliated colleges, were the immediate cause of a lively agitation for a 'Teaching University' for London, which sprang up in 1884, and led to negotiations which in 1900 issued in the reconstitution of the university. The senate in 1887 made some concessions, but rejected the claim of the colleges to be represented at its own board. University and King's Colleges, in combination, thereupon petitioned the Privy-council for a university charter of their own; while the Royal Colleges of Physicians and Surgeons, also in combination, petitioned for the power of granting degrees in medicine only. To investigate the merits of the points at issue, a Royal Commission was appointed in the spring of 1888. The report of the commission, issued in May 1889, propounded a scheme for the reorganisation of the university which offered harsher terms to the senate than those that were rejected in 1887, without, however, satisfying the two great London colleges. The senate therefore reopened negotiations with these colleges, and offered still more extensive concessions than those prescribed by the commission. The University of London Act of 1898 made pro-

vision for its reconstitution as a teaching body, and for the appointment of a commission, whose statutes for the reorganisation and regulation of the university received the royal sanction in 1900. The senate now consists of a chancellor, a chairman of convocation, and fifty-four persons nominated by the crown, by convocation, by University College, King's College, the Royal Colleges of Physicians and Surgeons, Lincoln's and Gray's Inns, and the Inner and Middle Temples, by the Incorporated Law Society, and the Guilds Institute. Convocation consists of the chancellor, the vice-chancellor, all members of the three standing committees of the senate not already on convocation, and the registered graduates. Members of convocation, not being women or otherwise disqualified, constitute the parliamentary constituency (4000 in number). Instead of four there are now eight faculties—Theology, Arts, Laws, Music, Medicine, Science, Engineering, and Economics and Political Science. The faculties consist of university teachers, nominated by the Royal Commission, appointed by the university, and admitted by the senate. The schools of the university in 1900 were in the several faculties, or in one or more faculties: University College and King's College, in London, for all the faculties; Hackney College, New College (Hampstead), Regent's Park College, Cheshunt College, the Richmond Wesleyan College, and the London College of Divinity in theology; Holloway College and Bedford College in arts and science; the Royal College of Science in its one faculty; the South-eastern College of Agriculture at Wye; the medical schools of St Bartholomew's, the London, Guy's, St Thomas's, St George's, the Middlesex, St Mary's, Charing Cross, and Westminster Hospitals, and the London School of Medicine, for women; the Central Technical College of the City and Guilds of London Institute in engineering; the London School of Economics and Political Science in that faculty. The Royal College of Music and the Royal Academy of Music were not willing to become a school of the university save on inadmissible conditions; the commissioners therefore excluded also Trinity College and the Guild Hall School of Music, but recognised teachers of the three first-mentioned institutes as teachers of the university. They regretted that, guided by the Gresham Commission, they felt precluded from recognising the training colleges of London and its neighbourhood, as giving too much prominence to elementary teaching and to training for elementary teaching. Boards of studies consisting of teachers of the university and others are appointed by the senate to deal with groups of subjects. Thirty-two boards were provided for. The series of examinations for both sexes begins with matriculation, from which there is no exemption. Numerous exhibitions and other prizes are open to competition among honours candidates at many of the examinations. The regulations for these examinations and all bylaws are laid down by the senate, often upon the recommendation of colleges, examiners, or convocation; but no such rules are valid until they have been approved by the Home Secretary.

The growth of the university, at least in point of numbers, was rapid, especially after 1858. In 1838 there were 23 candidates for matriculation, of whom 22 passed; in 1858 there were 299 candidates, of whom 249 passed; in 1895 there were 3120 candidates, of whom 1710 passed; and the increase in the higher examinations has been on a similar scale. For the first thirty years the university had no fixed abode; but in 1868 the government ordered the erection of a new building, specially for it, in Burlington Gardens, W.; this was completed, opened by the Queen, and occupied in 1870. In 1900 arrangements were made and sanctioned by

the Treasury for housing the newly reorganised university in parts of the buildings of the Imperial Institute at South Kensington. As the university was the child of the government of 1836, both that and succeeding governments recognised the duty of supporting it; and year by year an estimate of expenses has been laid before parliament, and covered by a vote. On the other hand, all the receipts from fees have been claimed by the Exchequer; but up to the year 1876 these scarcely equalled a third of the total cost of the university. Owing, however, to the increase in the number of candidates, the fees received in 1889 (nearly £15,000) more than covered the whole vote for working expenses, leaving the Treasury chargeable with the costs of the building, stationery, &c., altogether equal to perhaps another £8000. The grant in 1890-1900 was £18,840.

UNIVERSITY COLLEGE, at the time of the re-constitution of the university, had in its faculties of arts and laws, and of science, forty-four professorships, and in that of medicine twenty more. Its governing bodies, under president and vice-president, are a council and a senate; the latter comprising all the professors. King's College (q.v.) is the subject of a separate article.

On the re-constituted university see besides the Calendar the reports of the Commission, and the statutes, Professor Karl Pearson's *The New University of London* (1893), discussing the various schemes till then proposed.

London, a city and port of entry, capital of Middlesex county, Ontario, is situated at the junction of the two branches of the Thames, 116 miles by rail SW. of Toronto. It is a handsome city, regularly built, and contains many fine buildings; and the aim of its founders is visible in the names of the principal streets—Pall Mall, Oxford Street, Piccadilly, Cheapside, &c.—as well as of the river, which is crossed by a Westminster and a Blackfriars Bridge, and of the Covent Garden Market, Hyde Park, and St Paul's Cathedral. The centre of a rich agricultural district, and connected by railway with all parts of Canada, London carries on an extensive trade in the produce of the country; while it has also large petroleum refineries, and many foundries, mills, tanneries, and other manufactories. It has several colleges (including the Western University) of good standing, lunatic and orphan asylums, a convent, and a hospital; and its white sulphur-springs attract many invalids. London is the seat of Anglican and Roman Catholic bishops, and returns one member to parliament and one to the provincial legislature. Pop. (1881) 49,746; (1891) 31,997.

London Clay. See Eocene SYSTEM.

Londonderry, a maritime county of the province of Ulster, in Ireland, 40 miles long by 34 broad, is bounded N. by the Atlantic, and elsewhere by Antrim, Lough Neagh, Tyrone, and Donegal. Area, 816 sq. m. Pop. (1831) 222,174; (1861) 181,296; (1881) 164,991; (1891) 152,009, of whom 67,748 are Catholics, 48,936 Presbyterians, and 27,730 are Protestant Episcopalians. The surface rises the farther one travels inland, Mount Sawell, on the southern border, being 2236 feet high. The coast line (30 miles long) is generally bold and precipitous; but the shore of Lough Foyle is in most places an unvarying plain, large tracts having been reclaimed. The river Bann from Lough Neagh forms part of the eastern border of the county. The river Foyle intersects its western extremity. The principal crops are oats, potatoes, flax, and turnips. Thirty-seven per cent. of the area is permanent grass, and a large proportion of the cultivated soil is meadow land and clover. Linen (shirt-making) is the staple industry. The fisheries, both off the coast and in the

lakes, are valuable. The county returns two members to parliament, and the county town, Londonderry (q.v.), returns one. The other towns are Coleraine and Limavady. The county owned in ancient times the sovereignty of the O'Neil sept. It was subjected to English authority in the end of Elizabeth's reign. In 1609 the confiscated estates of the native Irish chieftains were granted by the crown to the corporation of London, the management being vested in the Irish Society, a body twenty-six in number, elected by the common council, one-half retiring each year. Portions of the county were assigned to twelve of the livery companies. At the present time the Irish Society and half a dozen of the London companies own more than one-fourth of the entire county; but several of these last, notably the Drapers' Company, have sold their estates to the occupying tenants under the Ashbourne Act.

Londonderry, or DERRY, a city, seaport, and parliamentary borough in the north of Ireland, is situated on an eminence overlooking the river Foyle, 3 miles from its mouth and 18 miles from the entrance to Lough Foyle, by rail 163 miles NNW. of Dublin and 95 NW. of Belfast. Pop. (1851) 49,888; (1871) 24,242; (1881) 29,162; (1891) 33,200. Londonderry grew up round a monastery founded here in 546 by St Columba. It was frequently held by the Danes from the 9th to the 11th century. The town formed part of the escheated territory granted to the London companies, and under their management rose to some importance, and was strongly fortified. In the Irish war of the Revolution thirteen Londonderry apprentices closed its gates against James II.; and the townsfolk, shouting 'No surrender,' manned the walls. The 105 days' siege that then ensued, from April to August 1689, is one of the most celebrated events in Irish history, and its memories are among the most stirring causes of party animosity. The walls still surround a part of the town one mile in circumference, but now the greater part of the city lies outside them. The four main streets diverge from a square in the centre of the city called the Diamond. The left bank of the river is connected by an iron bridge, 1200 feet in length, with an extensive suburb called Waterside. The Protestant cathedral dates from 1633; it was restored in 1886. A handsome Roman Catholic cathedral, the courthouse, guildhall (erected in 1890 at a cost of £20,000), harbour-offices, post-office, custom-house, and banks are the other chief buildings of note. The historical events of the siege are commemorated by a triumphal arch—one of the gates of the city—erected in 1789 and a column in honour of the Rev. George Walker, who was governor of the city and the soul of the defence. The Presbyterian theological Magee College was founded in 1865. The industrial establishments include linen (shirt-making) factories, distilleries, iron-foundries, flour-mills, and shipbuilding-yards. There are valuable salmon-fisheries in Lough Foyle. The harbour is deep, extensive, and safe. The great Atlantic liners (Allan, Anchor, and State) stop at the entrance to Lough Foyle both in going to and coming from America. The imports (which include grain, flour, timber, and spirits) reach an annual average value of £76,480; the exports, chiefly agricultural produce, vary in value from £6000 to £350,000 annually. This is exclusive of an extensive coasting trade. Londonderry returns one member to the House of Commons. See John Hempton's *Saga and History of Londonderry* (1861).

Londonderry, MARQUIS OF. See CASTLE-REGUL.

London Pride. See SAXIFRAGE.

Long. Loch, a beautiful Scottish sea-loch, striking off from the Firth of Clyde, 17 miles north-north-eastward between the counties of Argyll and Pembrokeshire, and 3 furlongs to 2 miles broad. It sends off Loch Gail (q.v.); is flanked by steep and fantastic mountains, 2000 feet high; and at Arrochar, near its head, approaches to within $\frac{1}{4}$ mile of Tarbet on Loch Lomond. A railway from Helensburgh to Fort William, commenced in 1889, skirts its eastern shore. Since 1862 the loch has been deified with the dredgings from the Clyde at the rate of 1,250,000 tons a year.

Long. George, scholar, was born at Poulton, Lancashire, 4th November 1800, and from Macclesfield went up in 1818 to Trinity College, Cambridge. In 1821 he was bracketed with Malden and Macanlay for the Craven scholarship; in 1822 graduated as a wrangler and senior Chancellor's medalist, and in 1823 was made Fellow of his college. In 1824 he accepted the chair of Ancient Languages in the university of Virginia, United States; but he returned to England in 1828 to become Greek professor in London University. Subsequently, at different periods of his life, he taught as professor of Latin at University College, London (1842-46), reader in jurisprudence and civil law to the Middle Temple (1846-49), and classical lecturer at Brighton College (1849-71). He had a share in founding the Royal Geographical Society (1830), and from 1831 took an active interest in the Society for the Diffusion of Useful Knowledge, writing books for its library and editing its *Journal of Education*. But the *magnum opus* of his life was the editing (1833-46) of the *Penny Cyclopædia*, to which he was one of the most valuable contributors. Besides this he edited the *Biographical Dictionary* (1842-44), Knight's *Political Dictionary* (1845-46), the excellent *Bibliotheca Classica* series, and many admirable versions of classic authors. He also translated *Selections from Plutarch's Lives*, *Thoughts of M. Aurelius* (1862), and *Discourses of Epictetus* (1877), contributed extensively to Smith's Classical Dictionary, and wrote *Decline of the Roman Republic* in 5 vols. He died 10th August 1879.

Longan (*Nephelium Longan*), one of the finest of fruits, of the same genus with the Litchi (q.v.), but reckoned superior to it.

Long Branch, a fashionable bathing-place of New Jersey, on the Atlantic Ocean, some 30 miles S. of New York city and 13 S. of Sandy Hook. Here are many costly cottages, occupied only in summer. Pop. 7231.

Longchamp, the racecourse, lying on the south-west side of the Bois du Boulogne, on the west of Paris, where the race for the *Grand Prix* is run. It was formerly the custom for the great folk of Paris to drive out in this direction, as far as the old nursery of Longchamp (founded in 1260), during the week preceding Easter.

Longchamp, WILLIAM DE, a Norman of low birth, and a favourite of King Richard I. The latter, on his accession, made Longchamp Bishop of Ely, and in 1190 joint justiciar of England with Hugh de Puisey; in 1191 he was likewise made papal legate. But his ambition, his arrogance, and his unpopular manners, combined with his oppressive taxation, made him greatly disliked, and Richard was obliged to send him back to Normandy. He regained the royal favour by his energy in raising the king's ransom; his reward came in the appointment of chancellor. He died in 1197, having been overthrown by the parties of John, Godfrey Plantagenet, the Barons, and Walter de Coutances, some time before. He disliked the English, and displayed his contempt for them in the coarsest way, declaring that he did not

understand their language and would not speak it. Nevertheless he was a clever and energetic ruler, administered strict justice, and was faithful to his prince. See the French monograph by L. Boivin-Champeaux (Eyreux, 1886).

Longevity. A term which in popular usage has come to mean great length of life instead of merely length of life; therefore, after a discussion of centenarianism, will follow a short account of the general theory.

The wide-spread belief that there are cases on record of persons living to the age of 150 or even 200 years, and that centenarians are numerous, is owing to a general love of the marvellous backed by superstition, and also to the fact that noted writers, such as Haller the physiologist, accepted and reasoned upon many such stories. But in 1862 Sir G. C. Lewis wrote in *Notes and Queries* an article in which he professed disbelief in any case of a life exceeding 100 years; he pointed out that neither the peerage and baronetage nor the books of insurance companies contained any evidence of such, and further that the current stories were nearly all of persons of humble rank, careless of registration, so that their statements could not be verified. This led to great correspondence in *Notes and Queries* and elsewhere; the editor, Mr Thoms, took the matter up, went into it with great care, and compiled his work on longevity which is authoritative. He examined many stories of very ancient persons, showing them to be baseless; while as to stock historical cases of Thomas Parr, Henry Jenkins, and the Countess of Desmond, reputed to be 152, 169, and 140 respectively, he found that there was no satisfactory evidence. For Jenkins there was none save his own assertion. Parr was before his death a celebrity, the poet Taylor wrote his life with numerous dates of various events, and Harvey in his post-mortem report repeats the popular hearsay—this is all the evidence to be found. As to the Countess of Desmond, Mr Thoms gives conclusive reasons for believing that the stories from which her age is deduced really relate to two, if not three, ladies of that title.

The evidence which is often said to exist in the registers has been proved in many cases to refer to two persons of the same name; and in one noted case, Carr of Shoreditch, said to be 207, the 2 was found to have been written upon the top of L. As to tombstones, the age 309 in one case being certainly some village chiseller's manner of writing 39, will serve as an example. In fact, a review of the evidence shows that while Lewis was right in renouncing his contention that no certain instances of a greater age than 100 existed, a belief in lives of 150 years is no longer possible. It remains to add that there is no scientific evidence to support the belief that the length of human life was once much greater than it is in modern times, nor the converse opinion that the length of life has been increasing since the Psalmist cited it at three score and ten. All that we certainly know is that in civilised countries the average length of life has been for many obvious reasons emphatically on the increase for several centuries.

There is another question of common interest: How shall we live to attain great age? There have been many teachers with many tads; but from the varied modes of life of those who have lived long it is probable that as no amount of feeding will make a man tall who is destined to be short, so no amount of care will prolong the life of one destined to die young. St Antony lives a life of excessive austerity and he dies at 105. Titian is all his life about a court and he paints a fine picture at ninety-six.

Statistics have been accumulated, and such general facts as that married people live longer

than unmarried, that women live longer than men, and that the clergy have longer lives than other professional men have been established; but deductions from facts such as these are unsafe in the present state of science—the whole subject is too complex.

Turning now to the general question of the length of life of plants and animals, we may notice at the outset that the unicellular organisms cannot and do not die after the fashion of those in which death seems to be the necessary price paid for a 'body'; that increase of intelligence naturally tends to lengthen life; that perfecting of the reproductive processes has the same result; that many males live much longer than their mates, and so on. More than one popular adage makes size the criterion of longevity, but it is at most a partial factor; for while an elephant lives 200 years and a mouse only 6, carp and pike may attain the age of the former, and one of Sir John Lubbock's queen ants surpassed the mouse by almost 9 years. A horse often lives 40 years, but the donkey may exceed this, while both are outstripped by the golden eagle (60), by an almost centenarian captive raven, by a toad, or even by Sir John Dalyell's sea-anemone 'Grannie,' which, after its removal from the Firth of Forth, lived in an aquarium for 59 years—from 1828 till 4th August 1887. Florens supposed that the length of life was five times the period of growth, but this does not hold even approximately for the majority of animals. Rapidity of life is another factor; thus the sluggish amphibian is long-lived, and trees may survive over 2000 years, in contrast to the transient life of many of our rapidly growing, brightly flowering annuals, or the yet more ephemeral existence of many intensely active insects. But on the other hand ants and bees often live for many years, and some of the most active birds attain a great age. According to Weismann, 'Duration of life is really dependent upon adaptation to external conditions; its length, whether longer or shorter, is governed by the needs of the species, and is determined by precisely the same mechanical process of regulation as that by which the structure and functions of an organism are adapted to their environment.' In other words, he maintains that the duration of life is fixed by natural selection; that, given the rate of reproduction and the average mortality, the length of life characteristic of any species is such that the numbers under fixed conditions will remain constant. His essay is suggestive, but natural selection is at present called upon to explain too much; for instance, he believes that that principle has determined that no creature shall long survive the period at which its reproductive activity ceases; but he does not seem to observe that a creature may not have sufficient energy for reproduction and yet quite enough to maintain life in an ordinary way for many years, as is notably the case with women. It may be noted that the unicellular animals in natural conditions probably never or hardly ever die a natural death; they may be eaten up, but, violence apart, they are virtually immortal; they divide, but in this there is no death. In fact, death probably began with the multicellular organisms, as the price paid for a body.

For general aspects of human longevity, see W. J. Thoms, *Longevity of Man*; G. M. Humphrey, *Old Age*; Barn Bailey, *Modern Methuselahs*. For general theory, see E. Ray Lankester, *Comparative Longevity*; and August Weismann, *Essays upon Heredity* (trans. by Foulton, &c.), which contain abundant references to other literature on the subject. See also INFUSORIA, PROTOZOA, REMIOPROCTERA, INSECTS; F. Hillebrand, *Die Lebensdauer, etc. der Pflanzen*, in Engler's *Botan. Jahrbuch*, Bd. ii. (Leip. 1881); and, for further literature, Giddes and Thomson, *Evolution of Sex* (1889).

Longfellow, HENRY WADSWORTH, born in Portland, Maine, U.S.A., February 27, 1807, and died in Cambridge, Massachusetts, Copyright 1800 in U.S. March 24, 1882. He inherited the best blood of the two Massa- By J. B. Lippincott Company.

chusetts colonies—Pilgrim and Puritan. His parents were in easy circumstances, and gave him the best education which the schools of the time afforded. At the early age of eighteen he graduated from Bowdoin College in Brunswick, Maine, in the class with Hawthorne, his life-long friend. His rank in college was high, especially in languages, ancient and modern. His translations then and afterward were noted for a felicity and point quite beyond the reach of ordinary scholars. In 1826 the trustees of the college sent him to Europe to qualify for the chair of Foreign Languages and Literatures; and he spent a year and three-quarters with this end in view in France, Spain, Italy, and Germany.

After his return home he married in 1831 Miss Potter of Portland, who died in Rotterdam in 1835, while they were making a tour in Europe; she is commemorated in the touching poem, *The Footsteps of Angels*. He had written poems while at college, and published them in magazines, chiefly in the *United States Literary Gazette*. His first book, omitting his numerous linguistic works, was a version of *The Captivity of Don Jorge Manrique*, a grave and stately poem, in itself probably inferior to Longfellow's fortunate translation, *Outre Mer*, an account of his first tour, appeared in 1835; and *Hyperion*, which is a journal of a later trip, in 1839. Both are interspersed with translations of German poems, and both have a permanent value as indicating the development of the poet's mind and art.

In November 1836 he became professor of Modern Languages and Literature in Harvard College, and held the chair nearly eighteen years, being succeeded by Mr Lowell. *Voices of the Night*, his first book of original verse, appeared in 1839. This gave to the world a distinctly new impression of tenderness, manly sentiment, and melody, and to the author an assured place among poets. The impression was deepened by the *Ballads* (1841), including 'The Skeleton in Armour,' 'The Wreck of the Hesperus,' 'The Village Blacksmith,' 'Excelsior,' and others. *Poems on Slavery* appeared in 1842. By this he gave evidence of his moral convictions and courage, for at that time anti-slavery poets and orators were unpopular to the last degree. In 1843 was published *The Spanish Student*, a drama slight in substance, but full of movement and gaiety, and brilliant in local colour.

He made a third visit to Europe in 1842, and on his return the following year was married to Miss Frances Appleton of Boston, a beautiful and accomplished woman, the mother of his five children. He made collections of poems, including some of his own translations: *The Wulf* (1845), *The Estuary* (1847)—both now very scarce—and *The Poets and Poetry of Europe* (1845). This last is a large and important work, in which he was aided by his friend C. C. Felton. *The Belfry of Bruges and other Poems* appeared in 1846. In the following year he gave to the world what is probably his most popular poem, *Evangeline*, a tale of the French exiles of Acadia, known and admired by readers of every degree, and translated into most modern tongues. Opinions may differ as to the use of the hexameter measure; but, while critics debate, the vital interest of the pathetic story seizes upon all hearts. *Korranough*, a prose tale, appeared in 1849. *The Seaside and the Fireside* (1850) contains 'The Building of the Ship,' one of the finest of his poems, which has a great hold upon the people of the United States on account of the

grand patriotic invocation with which it closes. *The Golden Legend* (1851), based upon an ancient German ballad, *Der Arme Heinrich*, by Hartmann von Aue, is a striking poem, medieval in tone and well sustained, though not a masterpiece. His genius is shown at its best in *Hiawatha* (1855), founded upon traditions and legends of the North American Indians. The light and tripping measure, the simplicity of phrase, and the well-calculated repetitions at first give an impression of artlessness, almost of baldness; but whoever reads the poem with enlightened eyes finds, under this easy flow of words, a series of poetic conceptions, the suggestion of noble and enduring images, and the mastery of just expression. *The Courtship of Miles Standish* (1858) is a story in hexameters of the early days of the Plymouth colony in Massachusetts. To the people of New England this poem has an inexpressible charm on account of its historical associations: it is a mirror of the life of the Pilgrims. The story is interesting in itself, and is told with easy grace. The poet was descended from the Priscilla of this poem, whose well-known question, "Why don't you speak for yourself, John?" is the keynote of the book. *Tales of a Wayside Inn* is a poem which appeared in parts, in different volumes (1863, 1872, 1874)—its plan suggested evidently by the *Canterbury Tales*. The Inn was in Sudbury, Massachusetts, famous a century ago, and the poet has gathered there a company of well-known men whom he portrays, and who in turn tell stories, some of which are from Boccaccio and other early writers, and some original. *Flower-de-Luce* (1867), though not so famous as other collections, shows in its twelve short poems some of the poet's most exquisite workmanship. *The New England Tragedies* (1868), in blank verse, treats mainly of the Salem witchcraft in the latter part of the 17th century. The next work was a complete and faithful translation of the three parts of Dante's *Divine Comedy* (1867-70). *Christos, a Masque*, being the gospel story in blank verse, appeared in 1872. This was afterwards printed with *The Golden Legend* and *The New England Tragedies* consecutively. *Three Books of Song*, containing the conclusion of *Tales of a Wayside Inn*, *Ambar Macabarius*, &c., was published in 1872; *Aftermath*, in 1874; *The Masque of Pausanias*, in 1875. This last volume contains a poem, "Morituri Salutamus," written for the fiftieth anniversary of the poet's graduation from college. The occasion, which was noticed throughout the United States, was most impressive and affecting. *Keramos* (1878) and *Ultima Thule* (1880) were the last of the long series. No mention is made of his many contributions to magazines and reviews, *Poems of Places*, a collection undertaken by the poet without too much thought of the magnitude of the task, reached 31 volumes.

He paid a last visit to Europe in 1868-69, and was received in England with honour and love. The greater and most fruitful part of Longfellow's life was passed at Cambridge, Massachusetts, where he lived in a stately colonial house which had been the headquarters of Washington during the siege of Boston, and which remains as he left it. His striking features, his full beard, and his massive head, crowned with abundant silvery hair, gave him a singularly noble look. He was free from the faults of many literary men never exhibiting envy or jealousy, and preserving always a serenity and amiability that won the hearts of all who met him. His relations with his contemporaries—Emerson, Hawthorne, Holmes, Lowell, and Agassiz—were intimate and hearty, and the literary society in which he moved was simple and charming.

He began as a translator, and in many respects his translations were his best work. He was

not a minute or methodical observer, but was open to all the impressions of nature, and his verse has a general rather than a particular truth in regard to the external world. He was not a profound student of human nature, and seldom throws any startling light into its secret rifts and contradictions; but he knew mankind in general, especially in their tender fibres, their interior life of alternate hope and depression, and in all that makes the delight of home. Of modern poets he is the one who has best expressed the feelings of natural men in regard to love and maternity, peace and goodwill, death and the future life. The wide gamut and perfect accord of his sympathies have made him the poet of the people without losing the regard and the respect of the cultivated few. How large a place he fills can best be estimated by considering the void that would be left if the *Voices of the Night*, *Evangelium*, and *Hiawatha*, and the long succession of poems could be blotted out from the memories of men. He did not consider himself one of the grand old masters, nor one of

the birds sublime,
Whose distant footsteps echo
In the corridors of Time.

If he was not great among the half dozen great poets, he was among those who have made the best use of their talents. The faculty of full and just, as well as of delicate and suggestive expression, developed by patient study, gave to his thoughts and sentiments a value and currency for which greater men have sought in vain. After all deductions there remains a great and almost incomparable treasure in his varied and beautiful works.

See his Life by his brother, the Rev. Samuel Longfellow (3 vols. 1886-87); and the memorial volume published shortly after his death by the present writer.

Long Firm. See FRAUD.

Longford, an inland county of Leinster, Ireland, bounded on the W. by the Shannon and on the SW. by Lough Ree. Its maximum length is 29 miles, its maximum breadth 20. Area, 421 sq. m. Pop. (1841) 115,491; (1861) 71,694; (1881) 61,009; (1891) 52,647. 91 per cent. Roman Catholics. The surface is for the most part flat, and the soil on the whole fertile, though extensive tracts of bog exist. Oats and potatoes are the principal crops; 51 per cent. of the area is permanent grass. The county is studded with numerous small lakes, and is crossed by the Royal Canal. Marble of good quality is found. Linen and coarse woollens are manufactured, and large quantities of butter are made. The county returns two members to parliament. Longford anciently formed part of the kingdom of Meath, and was included in Henry II.'s grant to Hugh de Lacy. It was erected into a county in 1564. The antiquities are of much interest, the islands of Lough Ree being especially rich in monastic remains.—**LONGFORD**, the county town, on the river Canlin and a branch of the Royal Canal, 76 miles NW. of Dublin by rail. Its best building is the new Roman Catholic cathedral (1840-93). Pop. 3827.

Longinus, DIONYSIUS CASSIUS, a famous Platonic philosopher and rhetorician of the 3d century, born at Emesa or at Athens, about 213 A.D. He studied at Alexandria, under Ammonius, and he himself taught rhetoric in Athens, where the famous Porphyry was a pupil. Later he settled at Palmyra, and became chief counsellor to the celebrated Queen Zenobia, whom he abetted in her determination to shake off the Roman yoke. For this he was beheaded as a traitor, by command of the Emperor Aurelian, 273 A.D. The only work of his that remains is the famous treatise *Peri Hypsion*

(*On the Sublime*), the authenticity of which has been impugned. There are editions by Egger (1837) and Otto Jahn (1867). See Vaucher's *Études critiques sur le Poète du Sublime* (Geneva, 1854).

Long Island, an island which forms three counties of the state of New York, bounded N. by Long Island Sound, E. and S. by the Atlantic Ocean, and W. by the East River (spanned by the Brooklyn suspension bridge). It is 115 miles long, and from 12 to 24 in width, with an area of 1682 sq. m. On its south shore is a series of lagoons, the largest 40 miles long and 5 or 6 wide. A line of low hills rises in the interior to 384 feet. There are numerous small lakes and watercourses, and market-gardening especially is carried on with success for the most part by Germans. But much of the island is waste land or forest, and such popular watering places as Coney Island (q.v.) are planted among deserts of sand. There is still a good deal of game, and the fisheries and oyster-beds are very valuable. The island has nearly 100 miles of railway. The principal towns are Brooklyn, Long Island City, and Flushing. Creedmoor (q.v.) is the principal American rifle-range. Long Island was the scene of a campaign in 1776, in which Sir Henry Clinton finally compelled Washington to evacuate the island. Pop. (1870) 540,648; (1890) 1,029,097. See NEW YORK.

LONG ISLAND SOUND, lying between Long Island and the mainland of New York and Connecticut, is from 2 to 20 miles wide, and from 75 to about 200 feet in depth. It is navigated by an immense number of coasting-vessels and steamers, and receives the Thames, Connecticut, Housatonic, and other rivers on its northern shore.

Long Island City, on Long Island, separated from New York city by the East River and from Brooklyn by the navigable Newtown Creek, was formed in 1870 from five villages. It is a railway terminus, and has some extensive manufactories, including oil-refineries, and carpet and piano works. Pop. (1880) 17,129; (1890) 30,396.

Longitude. See LATITUDE.

Longland, WILLIAM. See LANGLAND.

Longmans, a well-known firm of London publishers, whose name has been associated with high class literature for five generations. Thomas Longman (1699-1755), descended from a line of Bristol merchants, was bound apprentice to John Osborne, bookseller, Lombard Street, whose daughter he married. The earliest title page bearing the imprint of T. Longman is the Countess of Moreton's *Daily Exercise* (1665). The name of T. Osborne also appears on the title. Longman bought the business of William Taylor, publisher of *Robinson Crusoe*, conducted in Paternoster Row, and in 1726 moved there, the present site of the firm. As was the custom at that time, the first Longman held shares in many important publications, such as Boyle's *Works*, Ainsworth's *Latin Dictionary*, the *Cyclopaedia* of Ephraim Chambers, and Johnson's *Dictionary*. His nephew and successor Thomas Longman (1731-97) brought out a new edition of Chambers's *Cyclopaedia*. Under Thomas Norton Longman (1771-1842) the firm reached a high point of literary and commercial success, and from time to time fresh blood was introduced in the partners, Messrs Hurst, Rees, Orme, Brown, Green, and Roberts. When the government was about to impose an additional duty on paper, subsequent to that of 1791, the Longman firm used such arguments as averted that calamity. At that time the house had nearly £100,000 sunk in various schemes. Lindley Murray's *Grammar* was a good property, while the firm had a literary connection with Wordsworth, Southey, Coleridge, Scott, Moore (who received £3000 for *Lalla Rookh*),

Sydney Smith, and others. Byron's *English Bards* was rejected because of its severe handling of the Lake poets, whose works were issued by Longman. After Constable's (q.v.) failure in 1826 the *Edinburgh Review* became the property of the firm. Some of the foremost authors of the day were contributors to Lardner's *Cabinet Cyclopaedia* (1829-46) in 132 volumes. The next guiding spirits of the firm were Thomas Longman (1804-79), eldest son of T. N. Longman, who issued under his special care a beautifully-illustrated New Testament, and William Longman (1813-77), the third son. The latter figured as an author and historian, and printed privately a *See Works' Tour in Switzerland*, contributed to the *Alpine Journal*, was a president of the Alpine Club, and wrote *Lectures on the History of England* (1859), *History of the Life and Times of Edward III.* (1869), and *History of the Three Cathedrals of St Paul* (1873). The event of this generation was the publication in succession of Macaulay's *Lays* (1842) and *Essays* (1843), and *History*. The famous cheque for £20,000 paid to Macaulay 'on account' of his share of the profits of the third and fourth volumes for the first few months (1855) is still preserved. The absorption of the stock-in-trade and business connection of the Parkers in 1863 introduced the works of J. S. Mill, Froude, and Sir Comewall Lewis. The *Traveller's Library* was an excellent cheap series. The partners of the fifth generation are now Thomas Norton Longman and George Henry Longman, sons of Thomas Longman, and Charles James Longman and H. H. Longman, sons of William Longman. One of the earliest ventures of this generation was Lord Beaconsfield's *Endymion*, for which they gave the author £10,000. Lord Beaconsfield's other works had come into possession of the firm in 1870, when they published *Lathair*. Since the stoppage of *Fraser's Magazine* a sixpenny magazine has been published by the house *Longmans*. A partner, Thomas Brown, left in 1869 £10,000 each to the Booksellers' Provident Retreat and Institution, in which the firm has since been much interested. In 1890 Rivington's business and stock was bought by the Longmans. Rivington's was the only business which exceeded that of the Longmans in antiquity, and by this purchase a friendly rivalry of over 150 years came to an end.

Long Parliament, the name by which the fifth parliament summoned by Charles I. is known. It succeeded the Short Parliament, dissolved after three weeks, and met November 3, 1640. It began its work by reversing all the tyrannical and illegal acts of the past eleven years, with the abolition of the Star Chamber and High Commission, and the impeachment of Strafford; while it secured itself by an act that it could not be dissolved without its own consent. Just before Charles I.'s trial it was 'purged' by Colonel Pride of 96 members displeasing to the army, and the remnant the 'Rump'—continued to sit until its members were turned out by the Lord General Cromwell, April 20, 1653. The 'Rump' was recalled by the officers on the failure of Richard Cromwell to maintain his authority, and of the 160 members who had continued to sit after the king's death about 90 returned to their seats. Proving once more displeasing to the army, they were again turned out by General Lambert. They were restored amid the dissensions of the officers, as the only body in the country having any kind of legal authority, and, on the motion of Ashley Cooper, the members ejected by 'Pride's Purge' returned to their seats. After issuing the writs for a new election it dissolved itself, March 16, 1660. Thus ended the Long Parliament, which, twice expelled and twice restored, had lasted for twenty years.

Longridge, a small manufacturing town of Lancashire, 6½ miles by rail N.E. of Preston, on the side of the Longridge Fell, which extends 5½ miles N.E. to the boundary of Yorkshire. Here are Preston reservoirs, and manufactures of cotton goods, nails, &c. Pop. 4191. See Tom C. Smith, *History of Longridge* (1889).

Longships. See SCILLY ISLANDS.

Longstreet, JAMES, an American general, born in South Carolina in 1821, graduated at West Point in 1842, fought in the Mexican war, and in 1861 entered the Confederate service. He took part in both battles of Bull Run, that of Williamsburg, those around Richmond, and at Fredericksburg, Gettysburg, Chickamauga, and the Wilderness. Known to the soldiers as 'Old Pete,' he was considered the hardest fighter in the Confederate service. He was minister to Turkey in 1880-81.

Longton, a municipal borough of Staffordshire, is situated at the southern extremity of the Potteries, 2½ miles S.E. of Stoke-upon-Trent, and included within its parliamentary boundary. It was incorporated as a municipal borough in 1865, and its municipal boundaries were extended in 1883. The prosperity of the town is due to the manufacture of china and earthenware, though potting, brewing, and brick-making are also carried on. Close by are ironworks and collieries. Pop. (1851) 15,149; (1881) 18,620; (1891) 34,327.

Longneuil, BARONY OF. See LE MOYNE.

Longueville, DUCHESS OF (1619-79), the soul of the Fronde (q.v.).

Longwood. See ST HELENA.

Longwy, a small town and fortress in the extreme north of the French department of Meurthe-et-Moselle, 18 miles W.S.W. of Luxemburg. The fortress capitulated to the Prussians in 1792, 1815, and 1871. Pop. 5605.

Lönnrot, ELIAS, a great Finnish scholar and folklorist, was born at Sammatti in Nyland, 9th April 1802. He studied medicine, and practised for twenty years in Kajana, but in 1853 on Castrén's death succeeded to the chair of Finnish at Helsingfors, from the duties of which he retired in 1862. He helped to found the Finnish Literary Society at Helsingfors in 1831, and made throughout his life journeys through the whole of Finland, as well as the neighbouring parts of Lapland, Russia, and Sweden, in order to collect the remains of poetry and tradition lingering among the people. The first fruit of these inquiries was a collection of more or less ancient Finnish folk songs, *Kantelet* (1829-31), after which followed in 1835 the great epic of the *Kalevala*. His *Kanteletar* (1840) was a collection of lyrical folk-poetry; *Saamelaskuja* (1842), of proverbs; *Aseautuksien* (1844; 2d ed., much enlarged, 1861), of riddles. No less important were the contributions to Finnish philology which his profound knowledge of the popular dialects enabled him to make. His latest work was the great Finnish Dictionary (2 vols. 1866-80). He died at his native place, 19th March 1884.

Lons-le-Saunier, capital of the French department of the Jura, stands in a basin of the Jura Mountains, surrounded with vine-clad hills, 42 miles by rail E. by S. of Châlon-sur-Saône. It was founded in the 4th century, when its salt-springs were discovered; these are still in use for bathing, and salt is manufactured from them. Melons, white wine, and mathematical instruments are produced. Pop. (1872) 10,628; (1891) 12,427. Rouget de Lisle, the author of the *Marseillaise*, was born here.

Loo, a round game at cards, formerly called *hundred*. About five players make the best game. Each puts down a stake to form a *pool*.

The dealer stakes double. Three cards are dealt to each player as at whist, and an extra hand, called *miss*. The top card of the stock is then turned up for trumps. Each player in rotation looks at his hand, and *declares* whether he will play, resign, or take *miss*. If he takes *miss* he must play it. The declared players play one card each in rotation, the cards thus played forming a *trick*. The highest whist card wins, or if trumped, the highest trump. The winner of a trick leads to the next. The cards played remain face upwards before the players. If the leader holds ace of trumps (or king when ace is turned up), he must lead it; if he has two trumps, he must lead one. He is not obliged to lead the highest, unless (a) it is the ace (or king, ace being turned); or (b) there are only two declared players. Subsequent players must follow suit, and must head the trick if able. If not able to follow suit, and holding a trump, they must head the trick by trumping. The winner of the first trick must lead a trump if able. In other respects the play is as at whist. The winners of the tricks divide the pool, one-third for each trick. If only one declares to play, the dealer plays *miss* for the pool; tricks won by *miss* remaining in to augment the next pool. If only the dealer declares to play, he takes the pool. If each declared player wins a trick it is a *single*, and a fresh pool is staked as before, the deal passing to the left of the previous dealer. If any declared player fails to win a trick, he is *looted* the amount in the pool; the player who now deals puts in a single stake, no one else contributing. It is advisable to fix a limit beyond which a player cannot be looted. If there is more in the pool, the player is only looted up to the limit. There are no recognised laws of *loo*. The Bleenheim Club, for many years the best authority on *loo*, issued laws for the use of the members. These laws are republished in *Round Games at Cards* (De La Rue & Co.).

Loo, THE. See APPLDORF.

Loochoo (otherwise *Liukiu* or *Loo Kin*), a group of thirty-seven islands, of which the most considerable are Oshima and Okinawa. The islands extend at irregular intervals in a south-westerly direction from Kyūshū in Japan, and form the prefecture of Okinawa in that empire. Their aggregate area is 1863 sq. m., and the population amounts to only 160,000. Linguistically and ethnically the Loochooans are almost identical with other Japanese, and their manners, customs, and religious observances (Shintoist) bear a close affinity. They were formerly subject to the lord of Satsuma, and paid an annual tribute, having been completely subjected in 1609. China has made a claim upon the islands, which she still holds in reserve, but they are essentially Japanese soil. The men do not shave the hair like the Japanese; they pin it on the crown of the head, with a star in front. The women tattoo their hands. The streets are paved with stone, and stone walls ten or twelve feet high, giving the streets a desolate appearance, enclose the houses, which are similar in structure and arrangements to Japanese houses; the tiles used for roofing, however, are not black, but red in colour. There are no shops in Loochoo, only a market place in each town. The food of the people consists principally of sweet potatoes, pork, and fish, a pig being usually kept by each family. Oshima possesses a good harbour, but Naha, the port of Shima, capital of Okinawa, is an unsafe anchorage. Sugar is largely raised, also the sago palm, and an aromatic variety of orange; the cocoa nut palms do not seem to yield fruit. A small breed of ponies is found on the islands.

Loofah, EGYPTIAN. Under this name the fibrous portion of the fruit of one or two species of *Luffa* (nat. ord. Cucurbitaceæ) is sold in England for use as a bath-sponge or flesh-rubber. There are about ten species of the genus known, but the 'towel gourd,' as this bath-sponge is sometimes called, appears to be obtained chiefly from *L. aegyptiaca*. In the West Indies the fruit of *L. acutangula* yields a similar network of fibres, and it is there used as a sponge or dishcloth. The fibrous portion of these gourds is also worked up into baskets and small ornamental articles.

Looking-glass. See MIRROR.

Lookout Mountain, a ridge extending from near Chattanooga, in Tennessee, across the north-west corner of Georgia, and into Alabama, and rising to 1600 feet above the Tennessee River. It was carried by General Hooker in the battle of 24th November 1863.

Loom. See WEAVING.

Loomis, ELIAS, an American physicist, was born at Willington, Connecticut, 7th August 1811, graduated at Yale in 1830, and was tutor there in 1833-36. After a year's study in Paris he was professor (1837-44) of Mathematics in Western Reserve College, Ohio, of Natural Philosophy (1844-60) in the University of New York, and of Natural Philosophy and Astronomy (from 1860) at Yale. He died 15th August 1889. Professor Loomis devoted much of his time to original research, and was the author of over a hundred scientific treatises, and published a series of text-books on mathematics, natural philosophy, astronomy, and meteorology, of which more than 500,000 copies were sold.

Loon, or LOOM. See DIVER.

Loosestrife. See LYTHRACEÆ.

Lopez de Vega. See VEGA.

Loom. See PARAGUAY.

Lophobranchii. See BONY FISHES.

Loquat (*Eriobotrya Japonica*), an esteemed Chinese and Japanese fruit, of the natural order Rosaceæ, sub-order Roseæ, and of a genus closely allied to *Mespilus* (Medlar). It has been introduced into Australia and is now abundant there. The tree or shrub which produces it attains a height of 20 or 30 feet, but in cultivation is seldom allowed to exceed 12 feet. It is a beautiful ever-green, with large oblong wrinkled leaves, and white flowers in terminal woolly panicles, having a fragrance like that of hawthorn-blossom; the fruit is downy, oval, or pear-shaped, yellow, and about the size of a large gooseberry. The seeds have an agreeable flavour which they impart to tarts. The loquat lives in the open air in the south of England, and produces fruit; but a warmer climate is required for fruit of fine quality. It is hardy about London and southward in England. It may be grafted on any species of *Mespilus*.

Loranthaceæ. See MISTLETOE.

Lorca, a town of Spain, 36 miles SW. of Murcia. The gloomy and decayed Moorish part of the town is picturesquely situated on an eminence crowned by a fortified castle, whilst the modern town spreads out on the fertile plain at its foot. Here are saltpetre, gunpowder, and lead-smelting works, and manufactures of cloth, and in the neighbourhood silver and sulphur mines, &c. Pop. (1884) 28,422.

Lord (A.S. *hlaford*: from *hlaf*, 'loaf,' and, probably, *weard*, 'keeper,' 'master' i.e. master of the house), a title given in Great Britain to persons noble by birth or by creation. Peers of the realm are so styled, including such archbishops or bishops as are members of the House of Lords, who are Lords Spiritual. By courtesy, the title Lord

is given to the eldest sons of dukes, marquises, and earls, prefixed to an inferior title of the peerage, and to the younger sons of dukes and marquises, prefixed to their Christian name and surname (see COURTESY TITLES). The following persons, amongst others, bear the title Lord in virtue of their employments—the Lord-lieutenant of Ireland and Lord-lieutenant of counties, the Lord Chancellor, Lord Privy Seal, Lords of the Treasury and of the Admiralty, the Lord High Admiral, Lord Great Chamberlain and Lord Chamberlain, Lord High Constable, Lord High Almoner, Lord High Steward, Lord Steward of the Household, Lords in Waiting, Lords of the Bedchamber, Lords Justices, the Lord Chief Justice, the Lord Mayors of London, York, and Dublin, and the Lord Provosts of Edinburgh, Glasgow, Aberdeen, and Perth, and the Lord Advocate of Scotland (see special articles on TREASURY, JUSTICE, MAYOR, &c.). The judges of the Courts of Session and Justiciary in Scotland have the title 'Lord' prefixed to their surname or some territorial designation assumed by them; and throughout the three kingdoms judges are addressed as 'My Lord' when presiding in court. See ADDRESS (FORMS OF), NOBILITY, and PARLIAMENT.

Lord Howe Islands, a main island, 5 sq. m. in extent, with some small islets, lying in the Pacific in 31° 33' S. lat. and 159° 5' E. long., 300 miles E. of Port Macquarie in New South Wales. It was discovered by Lieutenant Ball in 1788, colonised in 1840, and is attached administratively to New South Wales. The flora is very rich, baobab-trees being particularly conspicuous. The surrounding waters are full of fish. The island consists of three volcanic ridges, rising to 2840 feet, and is crescentic in shape. Pop. (1859) 300; (1895) 60. A group of the Solomon Islands bears the same name; and a Lord Howe's Island is one of the Society Isles.

Lord-lieutenant OF A COUNTY, a permanent provincial governor appointed by the sovereign by patent under the Great Seal. The office in England arose from the occasional commissions of array issued by the crown in times of danger or disturbance, requiring experienced persons to muster the inhabitants of the counties to which the commissioners were sent, and set them in military order. The right of the crown to issue such commissions was denied by the Long Parliament, this question proving the immediate cause of the breach between Charles I. and his subjects. Their legality was established at the Restoration by a declaratory act. The lord-lieutenant, who is usually a peer or other large land-owner, as a rule is also the *Custos Rotularum* (q.v.). He is at the head of the magistracy, and is the chief executive authority. Under him, and of his appointing, are permanent deputy-lieutenants. He recommends qualified persons for the office of justice of the peace. Militia jurisdiction formerly belonged to him, but is now re-invested in the crown in 1871 (see COUNTY).

Lord-lieutenant OF IRELAND, the viceroy or deputy of the sovereign to whom the government of Ireland is nominally committed. The office has existed from a remote period, the appointment having been made under different designations. The powers of the lord-deputy, as the viceroy was frequently called, were in early times very extensive, almost regal. In the latter part of the 18th century the lord-lieutenant resided little in Ireland, visiting it only once in two years, to hold the session of parliament. Some lords-lieutenant never went to Ireland at all, and occasionally, instead of a viceroy, lords justices (see JUSTICES, LORDS) were appointed. Since the Union the lord-lieutenant has constantly resided in Dublin.

The lord-lieutenant is appointed under the Great

Seal of the United Kingdom, and bears the sword of state as the symbol of his viceregal office. He has the assistance of a privy-council, at present consisting of fifty-five members, appointed by the sovereign, and of officers of state. He is commissioned to keep the peace and the laws and customs of Ireland, and to see that justice is impartially administered. He has the control of the police, and may issue orders to the general commanding the troops for the support of the civil authority, the protection of the public, the defence of the kingdom, and the suppression of insurrection. He is the Grand Master of the Order of St Patrick, and may himself confer simple knighthood; and, previous to the disestablishment of the Church of Ireland, had the disposal of such preferment, as well as all the other patronage of the country. The granting of money, lands, and pensions, of all titles of honour except simple knighthood, the appointment of privy-councillors, judges, law-officers, and governors of forts, and the appointment to military commissions are reserved to the sovereign, acting, however, on the lord-lieutenant's advice and recommendation. In recent years, more especially since his chief-secretary has been a member of the cabinet, the position of the lord-lieutenant has become little more than an 'ornamental' one; and the abolition of the office is now contemplated. A memorial signed by almost all the Irish peers was presented to Lord Salisbury in 1889 praying for such abolition, which had been actually arranged for, as long ago as 1848, by Lord John Russell. Lord Clarendon having accepted office in that year on the understanding that he was to be the last lord-lieutenant of Ireland. On the occasional or temporary absence from Ireland of the lord-lieutenant, lords justices are appointed, who are usually the Lord Chancellor, the Vice-chancellor, and the Commander of the Forces. The salary is £20,000, with a residence in Dublin Castle, as well as one in the Phoenix Park. His tenure of office depends on that of the ministry of which he is a member. By Act 10 Geo. IV. chap. 7, a Roman Catholic is ineligible for the lord-lieutenancy of Ireland. There have been over thirty-five lord-lieutenants since the Union.

Lord of the Isles, a title borne by a race of chiefs who ruled the Western Islands of Scotland with almost regal authority. They were descended from Somerled the Lord of Argyll, on whom David I. having in 1135 expelled the Norwegians from Arran and Bute, conferred these islands. Afterwards, however, he quarrelled with Malcolm IV., and with a powerful force sailed up the Clyde, and, near Renfrew, encountering the royal army under the High Steward of Scotland, was defeated and killed, 1164. His three sons, Dugal, Angus, and Reginald, by his marriage with the daughter of Olaf the Red, the Norwegian king of the Isles, inherited the south isles along with a share of his mainland possessions. One of his grandsons left a daughter and heiress, married to Alexander, son and heir of Walter, High Steward of Scotland, who in her right obtained the isle of Bute. Somerled's sons alternately sided with the Norwegians and the Scots in their contests for the sovereignty of the Western Isles, which repeatedly changed masters. But after the defeat of Haec, his successor in 1266 ceded all the Western Islands to Scotland, on condition that a certain annual sum should be paid to Norway. Henceforward the descendants of Somerled held their possessions as vassals of the Scottish crown. They were represented at this time by three great nobles—the Lord of Lorn, who in the war of independence took part with Comyn and Baliol, Angus of Isla, and Allan of the North Isles, who supported the claims

of Bruce. Angus fought at Bannockburn, and it is said that Bruce, when he was about to bring up the reserve, addressed him in words adopted as a motto by some of his descendants, 'My trust is constant in thee.' John, his son and heir, joined the party of Edward Baliol, but he was ultimately pardoned by David II. and confirmed in his possessions. By his first marriage he obtained the isles of Eist, Barra, Bigg, and Ruin, and assumed henceforth the title of Lord of the Isles. He married, secondly, Margaret, daughter of Robert, High Steward of Scotland (afterwards Robert II.), who bore him three sons. Donald the eldest, second Lord of the Isles, in right of his wife claimed the earldom of Ross in opposition to the Regent Albany, and in attempting to make good that claim he fought in 1411 the celebrated battle of Harlaw. His son Alexander, third Lord of the Isles, was allowed by James I. to inherit the earldom of Ross from his mother; but notwithstanding he took up arms against the king, wasted the crown-lands near Inverness, and burned that town. James promptly attacked and routed the rebels, and their leader was fain to throw himself on the mercy of his sovereign. He presented himself before the king in the church of Holyrood, clothed only in his shirt and drawers, and holding his unsheathed sword by the point, and falling upon his knees, surrendered his sword and implored the royal clemency. His life was spared, but he was imprisoned for two years at Tantallon. During the minority of James II. he held the important office of Justiciar of Scotland north of the Forth. In 1445 he entered into a secret and treasonable league with the Earls of Douglas and Crawford, but died at his castle of Dingwall before any overt acts of rebellion had been committed. His eldest son John succeeded to his titles and estates, and carried on similar insurrectionary proceedings. But after the murder of the Earl of Douglas by James II. he took fright, and entreated the forgiveness of the king, which with some hesitation was granted to him, and he was made one of the wardens of the Marches. After the death of James II., the earl, along with the exiled Douglasses, entered into a treasonable league with Edward IV. of England for the conquest and partition of Scotland, and raised the standard of rebellion. His estates were in consequence forfeited, but on his submission he was restored to the lordship of the Isles; the earldom of Ross was annexed to the crown. In his old age his nephew and heir, apparently with his approbation, at the head of his vassals endeavoured to recover possession of that earldom. James IV., who at this time filled the throne, availed himself of the opportunity to break up that confederacy of the islanders, which had proved so troublesome to the peace of the country; and in the parliament of May 1493 John, fourth and last Lord of the Isles, was forfeited and deprived of title and estates. He retired to the monastery of Paisley, and dying about 1498, was buried beside his ancestor Robert II. In 1540 the Lordship of the Isles was annexed to the Scottish crown, and from it the Prince of Wales derives one of his titles. See A. Mackenzie's *History of the Macdonalds and Lords of the Isles* (Iny. 1882).

Lords-and-Ladies, a popular name for the common Anna q.v.

Lord's Day. See SABBATH.

Lord's Supper, one of the sacraments of the Christian religion, so called from its being instituted at supper by the Lord Jesus Christ. It receives also the names of Eucharist and Communion. With the exception of the Quakers, all sects of Christians, however different their views as to its nature,

agree in celebrating it as one of the most sacred rites of religion. The present article is written from the point of view of those who admit more or less the idea of a historical development of the doctrines connected with the Lord's Supper; the views of Roman Catholics, who hold that the doctrines of their church on the subject were delivered by our Lord and His apostles, and have from the first centuries been taught in substance in the church, will be found under TRANSUBSTANTIATION.

The circumstances of sorrow amid which it was instituted, and its intimate relation to the crowning work of Jesus, His death, had, at the very outset, made a deep impression upon the early church. We have four accounts of the institution, one from each of three evangelists, and one from St Paul (1 Cor. x., xi.); and those who hold the doctrine of the Real Presence see in John vi. an allusion to the Eucharist. Not only was the solemnity, in conformity with the original institution, repeated daily in conjunction with the so-called 'Love feasts' (*Agape*, q.v.), and retained as a separate rite when these feasts were set aside, but at a very early period it was believed to possess a peculiar efficacy, and soon ideas of the wonderful and mystical became associated with it. The Lord's Supper was celebrated on every important occasion of life—as when entering on marriage or to commemorate departed friends and martyrs; to those that could not be present at the meeting of the congregation, such as prisoners and sick persons, the indispensable food of heaven was carried by the deacons, and in some churches the communicants took part of the materials of the feast home with them, that they might welcome the gift of a new day with consecrated food. Heathens and unworthy persons, and Catechumens (q.v.) also, were excluded from this holy mystery. As early as the 2d century, Ignatius, Justin Martyr, and Irenæus advance the opinion that the mere bread and wine become, in the Eucharist, something higher—the earthly, something heavenly without, however, ceasing to be bread and wine. Though these views were opposed by some eminent individual Christian teachers, such as Origen, who took a figurative conception of the sacrament, and depreciated its efficacy, yet both among the people and in the ritual of the church, more particularly after the 4th century, the miraculous or supernatural view of the Lord's Supper gained ground. After the 3d century the office of presenting the bread and wine came to be confined to the ministers or priests. This practice arose from, and in turn strengthened, the notion which was gaining ground, that in this act of presentation by the priest a sacrifice, similar to that once offered up in the death of Christ, though bloodless, was ever anew presented to God. This still deepened the feeling of mysterious significance and importance with which the rite of the Lord's Supper was viewed, and led to that gradually increasing splendour of celebration which under Gregory the Great took the form of the mass. See LITURGY.

For a long time there was no formal declaration of the mind of the church on the presence of Christ in the Eucharist. At length, in the first half of the 9th century, a discussion on the point was raised by the Abbot of Corvey, Paschasius Radbertus, and Ratramnus, a learned monk of the same convent; they exchanged several violent controversial writings, *De Sanguine et Corpore Domini*, and the most distinguished men of the time took part in the discussion. Paschasius maintained that the bread and wine are, in the act of consecration, transformed by the omnipotence of God into that very body of Christ which was once born of Mary, nailed to the cross, and raised from the dead,

According to this conception nothing remains of the bread and wine but the outward form, the taste, and the smell; while Ratramnus would not allow that there is any change in the bread and wine themselves, but granted that an actual transformation of their power and efficacy takes place. The greater accordance of the first view with the credulity of the age, its love of the wonderful and magical, as well as with the natural desire for the utmost possible nearness to Christ, in order to be untailedly saved by Him, and the apparently logical character of the inference that, where the power, according to universal admission, was changed, there must be a change also of the substance—all these concurring influences brought it about that, when the views of Ratramnus were in substance revived by Berengarius, Canon of Tours, in opposition to Lanfranc, Archbishop of Canterbury, and Cardinal Humbert, the doctrine of Transubstantiation, as it came to be called, triumphed, and was officially approved by the Council of Rome in 1079. In the fourth Lateran Council at Rome (1215), under Innocent III., Transubstantiation was declared to be an article of faith; and it has continued to be so held by the Roman Catholic Church to the present day. The Greek Catholic Church sanctioned the same view of Transubstantiation at the Synod of Jerusalem in 1672. For the Calixtines and Taborites, see HESS.

The Reformation of the 16th century again raised the question of the nature of the Eucharist. The Lutheran Church rejected from the first the Catholic doctrine of Transubstantiation, as well as of the mass—i.e. the constant renewal of the sacrifice of Christ—and merely taught that, through the power of God, and in a way not to be explained, the body and blood of Christ are present in, with, and under the unchanged bread and wine ('Consubstantiation'). In opposition to this doctrine, it was laid down by Zwingli that the Lord's Supper is a mere commemoration of the death of Christ, and a profession of belonging to His church, the bread and wine being only symbols; a view which is adopted in substance by Socinians and Arminians. Luther bitterly opposed the symbolical view, especially towards the latter part of his career; Zwingli's doctrine was more repugnant to him than the deeper and more mystic Catholic doctrine.

Calvin sought to strike a middle course, which has been substantially followed by the Reformed Churches. According to him, the body of Christ is not actually present in the bread and wine, which he also holds to be mere symbols. But the 'faithful' receiver is, at the moment of partaking, brought into union with Christ, through the medium of the Holy Spirit, and receives of that heavenly power (efficacy) which is always emanating from His glorified body in heaven. Melancthon, in this controversy, was inclined to the views of Calvin; but he thought a union might be effected by adopting the declaration that Christ in the Eucharist is 'truly and really' present (not merely in faith). The endeavours of Melancthon and his party, by arbitrary alterations of the Augsburg Confession and other means, to effect a public reconciliation only served to rouse among the partisans of Luther a furious theological storm, and the result was the establishment of the views of Luther, and the final separation of the Lutheran and Reformed Churches.

The whole controversy relates to the *mode* in which the body and blood of Christ are present in the Lord's Supper; for it was agreed on all hands that they are present in some way. The Reformed theologians argued that *presence* is a relative term, opposed not to distance, but to absence; and that presence, in this case, does not mean local nearness, but presence in efficacy. Here they parted

company both with the Roman Catholic Church and with the Lutherans. They were willing to call this presence 'real' (if they want words, as Zwingli said), meaning true and efficacious, but they would not admit corporal or essential presence. But while the Reformed Churches were at one in holding that by receiving the body and blood of Christ is meant receiving their virtue and efficacy, there is some difference in their way of expressing what that efficacy is. Some said it was their efficacy as broken and shed i.e. their sacrificial efficacy; others, in addition to this, speak of a mysterious supernatural efficacy flowing from the glorified body of Christ.

With regard to the Reformed Churches, it may be remarked that their Confessions on this point were mostly framed for the express purpose of compromise, to avoid a breach with the Lutherans. Hence the language of these Confessions contains more of the mystical element than the framers of them seem, in other parts of their writings, to favour. And it is remarkable that the Anglican Confessions, which were framed under different circumstances, lean more to the symbolical view of Zwingli than do those of most of the Reformed Churches. The Thirty-nine Articles, after laying down that, 'to such as with faith receive the same, it is a partaking of the body of Christ,' repudiate the notion of Transubstantiation, and add, 'The body of Christ is given, taken, and eaten in the Supper only after an heavenly and spiritual manner. And the mean whereby the body of Christ is received and eaten in the Supper is faith.' The Anglican Church is divided on this, as on several kindred topics, into two parties: with one the symbolical view of the rite is predominant; the other party reprobate this view as 'low,' and maintain an *objective* 'mystical presence' of the thing signified, along with the sign. The view of the latter party as to the sacrificial nature of the Sacrament approaches very closely that of the Church of Rome. For the various points of difference amongst Anglicans as to vestments, the eastward position, &c., reference must be made to the books cited below. In the Mackonochie case (1869) it was decided that the celebrant had no right to kneel during the prayer of consecration; in the Purchase case (1871), that he had no right to adopt the eastward position.

The Presbyterian Church adopted substantially the views of Calvin. The words of the Westminster Confession are: 'That doctrine which maintains a change of the substance of bread and wine into the substance of Christ's body and blood (commonly called Transubstantiation) by consecration of a priest, or by any other way, is repugnant not to Scripture alone, but even to common sense and reason. . . . Worthy receivers, outwardly partaking of the visible elements in this sacrament, do then also inwardly by faith, really and indeed, yet not carnally and corporally, but spiritually, receive and feed upon Christ crucified, and all benefits of His death: the body and blood of Christ being then not corporally or carnally in, with, or under the bread and wine; yet as really, but spiritually, present to the faith of believers in that ordinance as the elements themselves are to their outward senses.' But the tendency is nowa-days to regard the rite in its commemorative character, and the signs as means of working upon the mind and feelings subjectively, rather than as the vehicle of any objective, mystically operating *grace*.

This variety of dogmatical opinion as to the Eucharist naturally gave rise to variety in the ceremonial of its observance. The Catholic notion of a mysterious transformation produced the dread of allowing any of the bread and wine to drop, and

led to the substitution of wafers (*hostia, ablata*) to the breaking of bread. The doctrine of the 'real union,' which declares that in the bread as well as in the wine, in each singly and by itself, Christ entire is present and tasted—a doctrine which was attested by waters visibly bleeding—caused the cup to be gradually withdrawn from the laity and non-officiating priests (see LITURGY); this practice was first authoritatively sanctioned at the Council of Constance, 1415. All the Reformed Churches restored the cup; in the Greek Church it had never been given. From the same feeling of deep reverence for the Eucharist the communion of children gradually came, after the 12th century, to be discontinued; the Greek Church alone admits the practice. Grounded on the doctrine of Transubstantiation, the Greek and Roman Catholic Churches hold the 'elevation of the host' (*hostia, victim* or *sacrifice*) to be a symbol of the exaltation of Christ from the state of humiliation; connected with this is the 'adoration of the host,' and the carrying it about in solemn procession. The use of leavened bread in the Greek Church, and of unleavened in the Roman Catholic and Lutheran, of water mixed with wine in the Roman Catholic and Greek Churches, and of unmixed wine in the Protestant Churches, magnified into importance by symbolical explanations, have given occasion to the hottest controversies. The greater part of the Reformed Churches agree in breaking the bread and letting the communicants take it with the hand (not with the mouth); and this practice is owing to the original tendency of those Churches to the symbolical conception of the Eucharist, in which the breaking of the bread and the pouring out of the wine are essential elements.

It has been contended that the early Christians celebrated the Lord's Supper daily, but a weekly celebration—originally in the evening along with the agapee—is more probable. Abuses at the Agapee (q.v.) led to the separation from them of the Lord's Supper, which now took place in the morning. Early synods ordained that the faithful should receive the communion at all the higher festivals—Epiphany, Easter, Pentecost, Christmas. Early morning communion, received fasting, is the rule with Catholics and High Anglicans, mid-day communion being allowed to aged and invalid persons. The Moravians always celebrate the communion in the evening. In the Roman Catholic Church, it is usual to reserve portions of the Sacrament after celebration for the purpose of permitting the sick to communicate in their own houses. As to kneeling or sitting at communion, see KNEELING. In the English Church it was usual to exclude non-communicants from being present during the rite, as the ancient church excluded catechumens; but neither the modern Catholic Church, the High Anglican, nor the Presbyterian practise this exclusion. In the Highlands of Scotland, through a morbid awe of eating and drinking unworthily, it is customary for devout Christians to postpone communicating till late in life. Of late some teetotalers insist on the use of unfermented wine in the Lord's Supper.

But although the great divisions of the Christian world have continued as churches to adhere to those doctrines about the Lord's Supper which were fixed and stereotyped in Acts of Council and Articles and Confessions about the time of the Reformation, we are not to suppose that the opinions of individuals within those churches continue equally uniform and fixed. Even Roman Catholic theologians, like Bossuet, have sometimes endeavoured to understand the doctrine of the church in a philosophical sense; and in the Lutheran Church the greatest variety of opinion prevails. Some uphold unmodified the dogmas of Luther; others accept them with

explanation; Hegel even undertook to ground them on speculative reason. Others, as Schleiermacher, would have recourse to the views of Calvin as a means of reconciliation with the Reformed Churches. Even all 'supernatural' theologians do not adhere strictly to the formulas of the church; while rationalism in all its phases tends to the pure symbolism of Zwingli.

See the relevant works of Hooker, Barrow, Jeremy Taylor, Waterland, Burnet, Calym, Hodge, Oosterzee, Dörner, Schmid; and Hagenbach's *History of Doctrines*; Wilberforce, *Doctrine of the Holy Eucharist* (1845); Pusey, *Doctrine of the Real Presence* (1855); Scudamore, *Notitia Eucharistica* (1875); J. H. Blunt, *Dictionary of Doctrinal and Historical Theology* (1870); Ebrard, *Das Dogma vom Abendmahl* (1846); Kahnis, *Die Lehre vom Abendmahl* (1851); Ruckert, *Das Abendmahl* (1856); Howson, *Before the Table* (1875); Armstrong, *The Sacraments of the New Testament* (New York, 1880); Dean Stanley, *Christian Institutions* (1881); Bridgett, *History of the Holy Eucharist in Great Britain* (1881); and a *Clerical Symposium on the Lord's Supper*, by Luthardt, Pressense, Littledale, and others (1881).

Lorelei, or **LURLEI** (*lri* = slate-rock), a rock which rises perpendicularly from the Rhine, to the height of 427 feet, near St Goar. It used to be dangerous to boatmen, and has a celebrated echo. But the name is best known from Heine's song of the siren who sits on the rock combing her long tresses, and singing so ravishingly that the boatmen, enchanted by the music of her voice, forget their duty, and are drawn upon the rock and perish. The legend is not, however, 'a *utrochen* of olden days'; the first form of it was an invention of Clemens Brentano, published in his ballad 'Zu Bacharach am Rheine wohnt eine Zauberin' (1800). It soon passed into a popular legend, and has suggested several variants to modern German poets. See Leimbach, *Die Lorelei-Dichtung* (1879).

Lorenzo. See MEDICI.

Loreto, an interior department of Peru, watered for thousands of miles by the Marañon and its tributaries. Area, 33,000 sq. m.; pop. 61,125. The quickest route from the coast to this province, which is only some 700 miles distant in a direct line, is round the north coast of South America and up the Amazons, a journey of 6500 miles. The capital is Iquitos (q.v.).

Loretto (properly LORETO), a city of Italy, stands 3 miles from the Adriatic and 15 by rail SSE. from Ancona. It has a royal palace (designed by Bramante), and 4134 inhabitants; but is chiefly noticeable as the site of the sanctuary of the Blessed Virgin Mary called l. 'Santa Casa, or Holy House, which is reputed to be the house in which the Virgin lived in Nazareth. It was miraculously translated, first, in 1291, to the neighbourhood of Fiume in Dalmatia, thence in 1294 to a wood near Recanati in Italy, and was finally transferred to its present site in 1295. The church of the Santa Casa stands near the centre of the town, before it a colossal bronze statue of Pope Sixtus V. Its great central door is surmounted by a splendid bronze statue of the Madonna; and in the interior are three bronze doors with bas-reliefs, representing the principal events of scriptural and ecclesiastical history. The Holy House itself is a single apartment of no great size, originally of rude material and construction, but now cased with white marble, and exquisitely sculptured, after Bramante's designs, by Sansovino, Bandinelli, and other artists. The subjects of the bas-reliefs are taken from the history of the Virgin Mary, with the exception of three on the eastern side, which are devoted to the legends of the Holy House itself. The image of the Virgin which it contains is traditionally believed to have been carved by

St Luke. The rest of the interior of the church is rich with bas-reliefs, mosaics (by Domenichino and Guido Reni), frescoes, paintings, and carvings in bronze. This shrine is visited by about 50,000 pilgrims annually, though formerly the number averaged 200,000.

L'Orient, a seaport in the French department of Morbihan, situated on a good bay, 116 miles by rail NW. of Nantes, is a well-built town, with a deep and spacious harbour. It was founded in 1664 by the French East India Company; but, after the ruin of their trade by the English towards the close of the next century, their plant was acquired by the government, who since 1815 have made L'Orient the principal naval shipbuilding-yard in France. The dockyard and arsenal are consequently among the best and largest in the country, and the place ranks as a fortress of the second class. L'Orient has schools of navigation and marine artillery, and an observatory. The inhabitants are engaged chiefly in shipbuilding and its cognate trades, and in fishing (especially sardines). The trade does not exceed a total of 100,000 tons annually. Pop. (1872) 30,928; (1891) 41,065. Off this port the British fleet under Lord Bridport defeated the French under Villaret-Joyeuse on 23d June 1795.

Lorimer (Fr. *lormier*, from Lat. *lorum*, 'a thong'), a maker of bits, spurs, stirrup-irons, metal mountings for saddles and bridles, and generally of all articles of horse-furniture. In London the lorimers, who had previously formed part of another guild, were incorporated by letters-patent in 1712; in Scottish burghs they have been comprehended as a branch of the corporation of Hammermen.

Lorimer, JAMES, jurist, was born at Aberdalgie, in Perthshire, on 4th November 1818, studied at Edinburgh, Geneva, Bonn, and Berlin, was called to the Scottish bar in 1845, and in 1862 appointed professor of Public and International Law in the university of Edinburgh. In 1873 he took a principal share in founding the Institute of International Law. He died on 13th February 1890. Besides being a busy contributor to the first edition of this *Encyclopædia* and to the *Edinburgh* and *North British Reviews*, he wrote, from the standpoint of the historic-political school, *Handbook of the Law of Scotland* (1862; 5th ed. 1885); *Constitutionalism of the Future* (1865; 2d ed. 1867); *Reasons for the Study of Jurisprudence as a Science* (1868); *Institutes of Law* (1872; 2d ed. 1880); and *Institutes of the Law of Nations* (1883-84), besides *The Universities of Scotland* (1854); *Political Progress not necessarily Democratic* (1857); and *Studies, National and International* (1891).

Loris, a genus of Lemnidae, with rounded heads and pointed snouts, slender bodies, very large eyes, and rudimentary tail or none at all. The genus has two other names, *Stenops* and *Nycticelus*. The two species known are both natives of the East Indies. The largest species, *L. tardigradus*, is not so large as a cat; the other, *L. gracilis*, is much smaller. They spend the day asleep on a branch, the body rolled up, and the head hidden between the legs. Their fur is rich and soft. Their motions are slow, and they advance stealthily on the insects and birds on which they prey.

Lorne. See ARGYLL and ARGYLL (DUKES OF).

Lorraine was incorporated in the German empire in 855, when Lothair II., son of the Emperor Lothair I., obtained the lands between the Scheldt, Meuse, and Rhine, called Lotharingia, or Lorraine (*Ger. Lothringen*). It at first included Alsace and Friseland; but these provinces were separated from it in 870. About 911 the ruler was elevated from the dignity of count to that of duke. In 954 Lorraine was divided into two

duchies, Upper and Lower Lorraine. The latter came into the hands of the Dukes of Brabant in the beginning of the 13th century, and from that time was known as Brabant. It was incorporated in Burgundy (q.v.) by Philip the Good in 1429, and now forms part of the kingdom of Belgium, and the provinces of Brabant and Guelderland in Holland. Upper Lorraine continued to be governed by its own dukes till 1736, when it was given to Stanislas, ex-king of Poland, and on his death in 1766 was united to France. It was afterwards subdivided into the departments of Meuse, Moselle, Meurthe, and Vosges. The district lying between Metz and the Vosges, which is called German Lorraine, was ceded to Germany at the peace of 1871. See ALSACE-LORRAINE.

Lorraine, CLAUDE. See CLAUDE LORRAINE.

Lory, a common name for the members of a family of parrots, technically known as Trichoglossidae, rigidly confined to the Australian region. They are beautiful, gregarious, noisy, quick-flying birds, feeding on fruits, and gathering the nectar of flowers with their brush-like tongues. The two largest genera are Trichoglossus and Lorius; altogether there are about ninety species. The name lory is also extended to the genus Eclectus, in a different family of parrots.

Los Angeles, the most populous city of southern California and capital of Los Angeles county, is 483 miles S.E. of San Francisco by the Southern Pacific Railroad. It is one of the oldest towns in the western states of America, and was already a thriving place when the Franciscan fathers established a mission here in 1781; its full name being *Pueblo de la Reina de los Angeles*. In 1835-47 it was the capital of the state of California. To-day it possesses a handsome opera-house, the University of southern California, a magnificent observatory, a Roman Catholic cathedral, and over one hundred Protestant churches. There are magnificent botanic gardens, parks, many fine public buildings, and a crematory. The Spanish population is rapidly disappearing, and of the 50,935 inhabitants in 1891 they formed an insignificant minority. The pop. in 1870 was only 5728; in 1880, 11,183. Los Angeles is the centre of the orange-growing industry, and in the city alone are two reservoirs, with a capacity of 850,000 gallons, used solely for purposes of irrigation. The residents are principally occupied in the cultivation and export of oranges, grapes, and other fruits, as well as the manufacture of wine. A great number of invalids and others seeking a fine climate resort to Los Angeles in the winter. See *California of the South*, by Lindley and Widney (1888).

Löss, or LOESS, a loamy deposit of Pleistocene age, abundantly developed in the valleys of the Rhine, the Danube, the Rhone, and many of their tributaries. It is a pulverulent yellowish-gray or brownish loam, homogeneous and non-plastic, and consists principally of clay with small angular grains of quartz, and extremely minute scales of mica, together with a larger or smaller admixture of carbonate of lime and some iron oxide. It has a tendency to cleave in vertical planes, and thus forms cliffs where streams intersect it. The organic remains of the loess consist principally of land-shells of existing species, but now and again fresh-water shells are met with. Occasionally, also, the remains of man and the Pleistocene mammals are encountered, such as mammoth, woolly rhinoceros, reindeer, glutton, &c. In some places again are found relics of lemming, marmot, jerboa, &c., and other forms which are suggestive of steppe conditions. Geologists are still in some doubt as to the origin of the loess. The deposit is of such variable thickness (from a few feet up to 100 yards), and

occurs at such very different levels, that it seems probable that more than one agency was concerned in its formation. Much of the loess was probably deposited from the flood-waters that escaped from the great ice fields and melting snows of glacial times. Some of it again seems to have been the result of the weathering and disintegration of pre-existing accumulations, and the washing down of the disintegrated material by rain. And it seems likely enough that the superficial portions of fluvio-glacial loams may have been modified to some extent by the action of wind. Richthofen, indeed, has maintained that the loess is essentially a wind-blown accumulation—a conclusion he came to from a study of the loess of China (q.v., p. 184). This theory, however, does not explain many of the phenomena, and the general opinion of geologists is in favour of the aqueous origin of loess as a whole. The European loess is undoubtedly associated with the glacial deposits of the Continent, and in North America, where loess is strongly developed, the same relationship obtains. The geologists of the United States Geological Survey maintain that the loessic accumulations which cover enormous areas in the great basin traversed by the Mississippi and its affluents are essentially of fluvial origin.

For a general account of the European loess, see J. Geikie, *Prehistoric Europe* (1881), and *Address to Geol. Section, Brit. Assoc., Newcastle Meeting* (1880). For American loess, see *Sixth Annual Report, U.S. Geol. Survey* (1885). For Chinese loess, see Richthofen's great work on China; also *Geol. Magazine* (p. 293, 1882).

Lost Property. In point of law, the finder of lost property is entitled to keep it until the owner is found; but there are certain circumstances in which the keeping of it will amount to larceny. The rule in England is that, if the finder find the property in such circumstances that he either knows the owner, or has reasonable grounds for believing that he can be found, then the taking of the property with intent to keep it will be larceny. If, for example, a servant finds a sovereign in her master's house, and keeps it, that is larceny; so, too, where the prompter on the stage of a theatre picked up a £50 note which had been dropped by one of the actors. On the other hand, if at the time of finding there be no reasonable probability of ever discovering the true owner, then there is no larceny, even though the finder does afterwards acquire knowledge of or reasonable probability of discovering the true owner. Again, there cannot be a conviction if the finder did not when he took the goods intend to convert them, or if he was under the reasonable impression that the owner had abandoned his right of property therein. It has also been decided that the mere keeping of a lost article, in hopes of getting a reward for giving it up, though the owner be known, does not amount to larceny. There is also no obligation on the finder of lost property to incur expense in advertising for the owner; and it is to be borne in mind that the real owner is not divested of his property by the loss, but can demand it from whosoever is in possession of it. But lost bills of exchange and notes, if transferred for valuable consideration without notice, become the property of the transferee. Moreover, the loser of a bill or note payable to bearer could not at English common law sue the party liable either on the bill or note itself, or on the indorsement, but by sec. 69 of the Bills of Exchange Act, 1882, the court may order that the loss of the instrument shall be no defence to the action if a proper indemnity be given. In Scotland, also, the tenor of a lost bill may be established by a process for proving the tenor. The finder of lost property is not entitled to it, where the property consists of gold, silver, &c., hidden in the earth, in which case the treasure trove belongs

to the crown; and the finder is bound to give notice thereof, under a penalty, though he is not guilty of theft till 'office be found,' or till the coroner's jury have declared it crown property. It is not theft to convert unclaimed wreck.

Lost Tribes. See BABYLONISH CAPTIVITY, ANGLO-ISRAELITE THEORY.

Lot (anc. *Oltis*), one of the largest tributaries of the Garonne in France, rises in Mont Lozere, a section of the Cévennes, flows in a generally western direction, being known at first as the Olt, through the departments of Lozère, Aveyron, Lot, and Lot-et-Garonne, and joins the Garonne from the right at Aiguillon, after a course of nearly 300 miles, nearly two thirds being navigable.

Lot, a department in the south of France, formed out of the old province of Guienne, and comprising the arrondissements of Cahors, Gourdon, and Figeac, is watered by the Dordogne and the Lot. Area, 2012 sq. m.; pop. (1872) 281,404; (1891) 253,885. The eastern districts are invaded by the Causses plateaus of the Cévennes. The valleys are fertile. Wheat, maize, tobacco, fruits, chestnuts, and wine are the more important products. Sheep breeding is largely carried on. Milling, tanning, and the manufacture of woollens are the only branches of industry. Capital, Cahors.

Lot. See DIVINATION, SORTES VIRGILIANÆ.

Lot-et-Garonne, a department in the south-west of France, formed out of the old provinces of Guienne and Gascony. It comprises the arrondissements of Agen, Villeneuve, Marmande, and Nérac, and is watered by the Garonne and its tributaries, the Gers and Lot. Area, 2067 sq. m.; pop. (1841) 347,073; (1891) 295,560. The department is a rolling plain and extremely fertile, except in the south-west, where it is invaded by the Landes (q.v.). The principal products are wheat, maize, wine (20 million gallons annually), hemp, fruits (the plums of Agen are particularly celebrated), tobacco, potatoes, flax, and oil-plants. Pine, cork, and chestnut woods are numerous. Poultry are reared in great numbers for exportation. Manufacturing industry is exhibited chiefly in metal-works, paper-mills, woollen and cork factories, distilleries, and tanneries.

Lothian, the whole territory anciently between the Tweed and the Firth of Forth, which, from 547 a portion of Bernicia or Northumbria, was not finally annexed to Scotland till 1018. The name is now restricted to Haddington, Edinburgh, and Linlithgow shires, which are called respectively East, Mid, and West Lothian. From it the Kers (q.v.) take the titles of Earl and Marquis of Lothian. See SCOTLAND and BORDERS.

Loti, PILEEE. See VIACD.

Lotions, or WASHES, are remedies, usually dilute, of a liquid, but not of an oily nature, which are applied to circumscribed portions of the surface of the body. The only preparations described under this name in the British Pharmacopœia are the yellow and black mercurial lotions, used generally, particularly the latter, in cases of syphilitic origin. Innumerable lotions are used, however, for various conditions and different parts of the body. The most important groups are antiseptic, solutions of corrosive sublimate, carbolic acid, boracic acid, &c.; sedative, containing opium, belladonna, acetate of lead, &c.; stimulating, containing capsicum, sulphur, chloride or sulphate of zinc, &c.

Lotophagi (Gr., 'lotus eaters'), a name applied by the ancients to a peaceful and hospitable people inhabiting a district of Cyrenaica, on the north coast of Africa, and much depending for their subsistence on the fruit of the lotus tree, from which they also made wine. According to Homer, they

received Ulysses hospitably, when, in the course of his wanderings, he visited them along with his companions, on whom, however, the sweetness of the lotus-fruit exercised such an influence that they forgot all about their native country, and had no desire to return home. This feeling of happy languor has been expressed with marvellous felicity by Tennyson in his poem 'The Lotus-eaters.'

Lottery. See GAMBLING.

Lotus. The name *Lotus* (Lat. *Lotus*) was given by the Greeks to a number of different plants whose fruit was used for food. One of the most notable of these is the *Zizyphus Lotus* of the north of Africa and the south of Europe, a shrub belonging

Nymphaea Lotus.

to the natural order Rhamnaceæ (see JELFIRE).—The fruit of the *Diospyros Lotus*, or Date Plum (q.v.), is the European *Lotè*.—The name lotus was also given to several beautiful species of Water-lily (q.v.), especially to the Blue Water-lily (*Nymphaea caerulea*) and the Egyptian Water-lily (*N. lotus*), which grow in stagnant and slowly running water in the south of Asia and north of Africa. The *Nymphaea lotus* grows in the Nile and adjacent rivulets, and has a large white flower. The root is eaten by the people who live near the lake Manzaleh. The rivulets near Damietta abound with this flower, which rises 2 feet above the water. It was the rose of ancient Egypt, the favourite flower of the country, and was often made into wreaths or garlands, placed on the foreheads of women, or held in their hands, and smelt for its fragrance. It frequently appears in the hieroglyphs, where it represents the Upper Country or Southern Egypt, and capitals of columns, prows of boats, and heads of staves were often fashioned in its shape. In mythology it was the emblem of Neter-Tum; Harpocrates is seated upon it; and there was a mystical lotus of the sun. The lotus of Chinese and Hindu mythology is the Nelumbo (q.v.).

Lotto, LORENZO, painter, was born about 1480 in Venice, and died about 1556 in Loretto, where he was latterly supported by the Santa Casa, on which he had bestowed his property. He painted mainly religious and allegorical subjects. See monograph by Berenson (London, 1895).

Lotze, RUDOLF HERMANN, philosopher, was born at Bantzen in Saxony, on 21st May 1817, studied both medicine and philosophy at Leipzig, was appointed professor of the latter subject at the same university in 1842 and at Göttingen in 1844; in 1881 he moved to Berlin, but died on 1st July of that year. It was as a physiologist that he first attracted notice by his articles contributed to Wagner's *Handwörterbuch der Physiologie*. In these he combated the now exploded doctrine of vitalism or a specific 'Lebens-

kraft,' and argued for a thorough-going mechanical treatment of the phenomena of life. The same views were expressed in his *General Physiology of Bodily Life* (1851), and led many to rank him with the materialistic thinkers of the day, though his real philosophical position, to which he remained constant through life, had been already expressed in his *Metaphysik*, published in 1811. The most comprehensive statement of his views on nature and man is contained in his *Microcosmos*, published in 3 vols. in 1856-61 (4th ed. 1885; Eng. trans. 2 vols. 1886). By this book, which he calls 'an attempt at an anthropology,' and in which he invokes the example of Herder, he is most widely known. His attractive style and the semi-popular character of some of its disquisitions have contributed to make it read beyond the schools. A more systematic presentation of his thought on which he was at work towards the close of his life was cut short by death. Only two of the three promised volumes appeared, the first on *Logic* (1874; 2d ed. 1880; Eng. trans. 1884), and the second on *Metaphysics* (1879; 2d ed. 1884; Eng. trans. 1884). In addition to the works named, his *Medicinische Psychologie* (1852) and his *Geschichte der Esthetik in Deutschland* (1868) deserve mention. The paragraphic summaries of his lectures which he was wont to dictate to his students, published in a series of small volumes since his death, afford a useful conspectus of his views. Their publication and translation into English may be taken as a sign of the important influence which Lotze had of late come to exercise upon contemporary thought. Philosophically, Lotze comes of the lineage of Leibnitz and Herbart; he starts, that is to say, from the standpoint of individualism or monadism. But he has also been powerfully influenced by Hegel and the German idealists, and he rounds off his individualism with the doctrine of one infinite real Being, within which individuals act and live. He considers this the only supposition which can explain the action of individual things upon one another. Lotze carries on, however, a constant polemic against what he considers the exclusively intellectual and abstract character of Hegelianism, and his own philosophy may be treated as in great part a justification and reassertion of feeling—in other words, of the demands made by man's ethical, aesthetic, and religious instincts. His other polemic is against the so-called scientific philosophy of the age. While conceding to mechanism its fullest rights in the explanation of events, Lotze everywhere insists that mechanism gives only, as it were, the scaffolding of existence, and that the meaning of the universe can only be read in the light of the Highest Good. Mechanism must be regarded philosophically as the instrument of purpose. Lotze's doctrine is therefore a teleological idealism, largely based on ethical considerations. His distinction, however, is not that of a systematic thinker, and he combats the deductive tendency of his predecessors in German philosophy; his works offer us acute and suggestive reflections on the chief subjects of philosophical interest. See H. Jones, *The Philosophy of Lotze* (1895).

London. GIDEON ERNST, FREIHERR VON, Austrian generalissimo, was born on 2d February 1716, at Tootzen, in Livonia, whither his ancestor had migrated from Ayrshire in the 14th century. In 1732 he entered the Russian service, but ten years later exchanged into that of Austria, soon afterwards marrying and turning Catholic. In the Seven Years' War he won the title of Freiherr (Baron) at Hochkirch (1758); at Kunersdorf (1759) he turned defeat into victory; and his loss of the battle of Lignitz (1760) was due mainly to Lacy and Daun. As field-marshal he commanded in the war of the Bavarian succession (1778), and against

the Turks (1788-89), capturing Belgrade and Semendria. He died at Neutitschein, 14th July 1790. For an admirable estimate of his great military genius, see his *Life* by Colonel Mülleson (Lond. 1884).

London. JOHN CLAUDIUS, a distinguished botanist and horticulturist, born April 8, 1783, at Cambuslang, in Lanarkshire. He became a gardener, and in 1803 published *Observations on Laying out Public Squares*, and in 1805 a *Treatise on Hot-houses*; later he wrote, with an ardour that neither ill-health nor poor circumstances could abate, a long series of books on botany, mostly of a somewhat popular character, which have contributed much to extend a knowledge of that science and a taste for horticulture. Amongst these are the *Encyclopaedia of Gardening* (1822), and of *Agriculture* (1825); the *Greenhouse Companion* (1825); the *Encyclopaedia of Plants* (1829), and the *Arboretum et Fruticetum Britannicum* (8 vols. 1838), containing a very full account of the trees and shrubs, indigenous or introduced, growing in the open air in Britain. This last is his greatest work; but the expense attending the publication, owing chiefly to the number of plates, involved him in pecuniary difficulties. He died at Bayswater, December 14, 1843. London established four different magazines, which he edited simultaneously with his *Arboretum*. In his work he was greatly aided by his accomplished and devoted wife.

Loughborough, a municipal borough, incorporated in 1888, of Leicestershire, 11 miles NNW. of Leicester. The Decorated parish church dates from the 14th century, but has a Perpendicular tower. The grammar-school was founded in 1495, the girls' grammar-school in 1849, and a free library in 1885. Hosiery is the staple manufacture; and bell-founding was introduced in 1840, the great Bell (q.v.) of St Paul's being cast here in 1881. Other industries are dyeing, brick-making, and the manufacture of machinery. There is an active trade in coal. John Howe and Cleveland were natives, and Wedderburn took hence his title Lord Loughborough. Pop. (1851) 10,900; (1891) 18,196. See Dimock-Fletcher's two monographs (1883).

Loughrea, a market-town in County Galway, beautifully situated on a little fresh-water lake, 17 miles SW. of Ballinasloe. It has ruins of a castle and Carmelite monastery, both of about 1300. Pop. 3159.

Louis I. of Bavaria. See BAVARIA.

Louis IX. or ST LOUIS, king of France, born at Poissy, April 25, 1215, succeeded his father, Louis VIII., in 1226. His mother, Blanche of Castile, a woman of great talent and sincere piety, was regent during his minority, and bestowed on him a strictly religious education, which materially influenced his character and policy. When Louis attained his majority he became involved in a war with Henry III. of England, and by his victories compelled the English king to acknowledge French suzerainty in Guienne. During a dangerous illness he made a vow that, if he recovered, he would go in person as a crusader, and accordingly, having appointed his mother regent, he sailed in August 1248, with 40,000 men to Cyprus, whence, in the following spring, he proceeded to Egypt, thinking by the conquest of that country to open the way to Palestine. He took Damietta, but was afterwards defeated and taken prisoner by the Mohammedans. A ransom of 100,000 marks of silver procured his release on May 7, 1250, with the remnant (6000 men) of his army. He proceeded by sea to Acre, and remained in Palestine till the death of his mother (November 1252) compelled his return to France. Having a

large number of blood-relations among the dukes and counts of France, he used these to strengthen the 'legitimist' loyalty to his house, determined by the Pragmatic Sanction the relation of the French Church to the pope, founded the theological college in Paris famous under the name of 'La Sorbonne,' gave France a new judicial organisation by setting up in the provinces royal courts of justice or parliaments, which superseded the jurisdiction of the 'lord of the manor,' and gradually gave rise to the *noblesse de robe*, from amongst which the kings recruited their civil servants. A code of laws was brought into use, known as the *Etablissements de St Louis*. Louis embarked on a new crusade, July 1, 1270, and proceeded to Tunis; but a pestilence breaking out in the French camp carried off the greater part of the army and the king himself. He died August 25, 1270; and his son, Philip III., was glad to make peace and return to France. Pope Boniface VIII. canonised him in 1297. See the *Vie de St Louis* by Joinville (q.v.), Louis's friend, and Wallon's Life of him (2d ed. Paris, 1878).

Louis XI., king of France, the eldest son of Charles VII., born at Bourges, July 3, 1423, was from his boyhood eminently cruel, tyrannical, and perfidious. He made unsuccessful attempts against his father's throne, was compelled to flee to Brabant, and sought the protection of Philip the Good, Duke of Burgundy, with whom he remained till his father's death in 1461, when he succeeded to the crown. The severe measures which he immediately adopted against the great vassals led to a coalition against him, at the head of which were the great Houses of Burgundy and Brittany. Louis owed his success more to his artful policy than to arms; and, the war threatening to break out anew, he invited Charles the Bold, Duke of Burgundy, to a friendly conference at Péronne in October 1468. His agents meanwhile had stirred up the people of Liège to revolt against the duke, in return for which deed Charles made him a prisoner, and compelled him to associate in the punishment of Liège. Full of resentment, Louis then stirred up against Charles the Flemish towns and the Swiss republics. It became from that time a practice with French kings to have Swiss mercenaries in their pay. The Swiss defeated Charles twice, and killed him in a last battle (1477). Louis then claimed Burgundy as a vacant French fief, but was prevented from gaining possession of Charles's Flemish lands by the marriage of Mary, the rightful heir, to Maximilian of Austria. The troops of the latter defeated the French at Guinegate (1479), but the war was renewed on the death of Mary. A peace was concluded at Arras, December 25, 1482, by which the counties of Burgundy and Artois were handed over to France. Louis was also successful—after the use of means far from honourable—in annexing Provence to the crown as a lapsed fief. In order to weaken his feudal vassals he greatly increased the power and number of parliaments, an institution agreeable to the towns and to the middle class, and to which he began to grant a voice in matters of state. His favourite residence was the chateau of Plessis-les-Tours, close to Tours. His chief advisers and favourites were Olivier le Dain, originally a barber, but made a count; Tristan l'Hermite, and Cardinal Baluc. He spent the latter years of his reign in great misery, in excessive horror of death, which superstitions and ascetic practices failed to allay. He died at Plessis-les-Tours, August 30, 1483. He is said to have been the author of *Les veul Nouvelles nouvelles*, a sort of imitation of the *Decameron*, and of the *Rosier des Guercis*, a book of instruction for his son. He founded three universities.

See the contemporary *Mémoires* of Philippe de Comines (q.v.); works by Legeay (1874), Willert (in English, 1876), Buet (2d ed. 1886), and Vaesen and Charavay (1885 *et seq.*); and Scott's *Quentin Durward*. The well-known play *Louis XI.* is by Delavigne.

Louis XIII., king of France, son of Henry IV. and Marie de' Medici, born at Fontainebleau, 27th September 1601, succeeded to the throne on the assassination of his father, 14th May 1610, his mother being called to the regency by an edict of the parliament of Paris, which had acquired a right to speak in the name of all the others. She entered into close alliance with Spain and the pope, and betrothed the king to Anne of Austria, daughter of Philip III. of Spain, upon which the Huguenots took up arms; but peace was concluded at St Menchould on 5th May 1614. The king, who was now declared of age, confirmed the Edict of Nantes, and in the same year the French *États Généraux*—consisting of members of the clergy, the nobility, and the middle classes, a body more ancient than the parliaments, and in which the *bourgeoisie* sided with the kings—were summoned for the last time, as the events proved, till the reign of Louis XVI., for this constitutional chamber showed itself powerless to agree upon and follow out a policy. The restoration of Catholic church-rights in Bearn led to the religious war, in which the Protestants lost almost all their places of security, and which ended in 1622. After the death of De Luynes, in 1624, Richelieu, afterwards Cardinal and Duke, became the chief minister of Louis. His powerful mind obtained complete control over that of the weak king, and his policy effected that increase of monarchical power, at the expense of Protestants, nobles, and parliaments, which reached its consummation in the reign of Louis XIV. The overthrow of the Huguenots was completed by the capture of Rochelle, 20th October 1628, at the siege of which the king took part in person. Richelieu now led Louis to take part in the Thirty Years' War, openly supporting Gustavus Adolphus and the Dutch against the Spaniards and Austrians. The latter years of Louis's reign were signalised by the getting possession of Alsace and of Roussillon, acquisitions which were confirmed in the following reign. Louis died 14th May 1643. Under his reign was prepared the period of French ascendancy in Europe. His queen, after twenty-three years of married life, bore a son in 1638, who succeeded to the throne as Louis XIV.; and in 1640 a second son, Philip, Duke of Orleans, the ancestor of the present House of Orleans.

See MARIE DE' MEDICI, RICHELIEU; and French works by Bazin (new ed. 4 vols. 1846), Topin (1876), and Zeller (1879).

Louis XIV., king of France, born at St Germain-en-Laye, 16th September 1638, succeeded his father, Louis XIII., in 1643. His mother, Anne of Austria, became regent, and Mazarin (q.v.) her minister. During the king's minority the discontented nobles, encouraged by Spain, sought to shake off the authority of the crown, and the civil wars of the *Fronde* (q.v.) arose. Peace was concluded in 1659; and in the following year Louis married the Infanta Maria Theresa, a princess possessing neither beauty nor other attractive qualities. Little was expected from the young king; his education had been neglected, and his conduct was dissolute; but on Mazarin's death in 1661 he suddenly assumed the reins of government, and from that time forth carried into effect with rare energy a political theory of pure despotism. His famous saying, 'L'état c'est moi' ('I am the state'), expressed the principle to which everything was accommodated. He had a cool and clear head, with much dignity and amenity of manners,

great activity, and indomitable perseverance. The distress caused by the religious wars had created throughout France a longing for repose, which was favourable to his assumption of absolute power. He was ably supported by his ministers. Manufactures began to flourish under the royal protection. The fine cloths of Louviers, Abbeville, and Sedan, the tapestries of the Gobelins, the carpets of La Savonnerie, and the silks of Tours and Lyons acquired a wide celebrity. The wonderful talents of Colbert (q.v.) restored prosperity to the mined finances of the country, and provided the means for war; whilst Louvois (q.v.) applied these means in raising and sending to the field armies more thoroughly equipped and disciplined than any others of that age.

On the death of Philip IV. of Spain Louis, as his son-in-law, set up a claim to part of the Spanish Netherlands; and in 1667, accompanied by Turenne (q.v.), he crossed the frontier with a powerful army, took many places, and made himself master of that part of Flanders since known as French Flanders, and of the whole of Franche Comté. The *triple alliance*—between England, the States-general of Holland, and Sweden—arrested his career of conquest. The treaty of Aix-la-Chapelle (1668) forced him to surrender Franche Comté. He vowed revenge against the States-general, strengthened himself by German alliances, and purchased with money the friendship of Charles II. of England. He seized Lorraine in 1670; and in May 1672 again entered the Netherlands with Condé and Turenne, conquered half the country in six weeks, and left the Duke of Luxembourg to lay it waste. The States-general formed an alliance with Spain and with the emperor, but Louis made himself master of ten cities of the empire in Alsace, and in the spring of 1674 took the field with three great armies, of which he commanded one in person, Condé another, and Turenne a third. Victory attended his arms; and, notwithstanding the death of Turenne and the retirement of the Prince of Condé from active service, he continued in subsequent years, along with his brother, the Duke of Orleans, to extend his conquests in the Netherlands, where, by his orders, and according to the ruthless policy of Louvois, the country was fearfully desolated. The peace of Nimeguen in 1678 left him in possession of fortresses in the Spanish Netherlands and of Franche Comté. He now established *Chambres de Revision* in Metz, Breisach, and Besancon, packed courts of law, in which his own will was supreme, and which confiscated to him, as feudal superior in right of his conquests, territories which he wished to acquire, seignories belonging to the Elector Palatine, the Elector of Trèves, and others. He also, on 30th September 1681, made a sudden and successful attack on Strasburg, a free German city, the possession and fortification of which added greatly to his power on the Rhine. The acquisition thus made a treaty in 1684 confirmed to him.

Louis had now reached the zenith of his career. All Europe feared him; his own nation had been brought by tyranny, skilful management, and military glory to regard him with Asiatic humility, admiring and obeying; all remnants of political independence had been swept away; no Assemblies of the States or of the Notables were held; the nobles had lost both the desire and the ability to assert political power; the municipal corporations no longer exercised any right of election, but received appointments of officials from the court; the provinces were governed by *intendants*, who were immediately responsible to the ministers, and they to the king, who was his own prime-minister. Even the courts of justice yielded to the absolute sway of the monarch, who interfered at pleasure

with the ordinary course of law, by the appointment of commissions, or withdrew offenders from the jurisdiction of the courts by *Lettres de Cachet* (q.v.), of which he issued about 9000 in the course of his reign. He asserted a right to dispose at his pleasure of all properties within the boundaries of his realm, and took credit to himself for gracious moderation in exercising it sparingly. The court was the very heart of the political and national life of France, and there the utmost splendour was maintained; and a system of etiquette was established which was a sort of perpetual worship of the king.

It was a serious thing for France and the world when Louis fell under the control of his mistress, Madame de Maintenon (q.v.), whom he married in a half-private manner in 1685, and who was herself governed by the Jesuits. One of the first effects of this change was the adoption of severe measures against the Protestants. When it was falsely reported to Louis that his troops had dragooned all heretics into conversion, he revoked the Edict of Nantes in 1685, and then ensued a bloody persecution; whilst more than half a million of the best and most industrious of the inhabitants of France fled, carrying their skill and industry to other lands. Yet Louis was by no means willing to yield too much power to the pope; and, quarrelling with him concerning the revenues of vacant bishoprics, he convened a council of French clergy, which declared the papal power to extend only to matters of faith, and even in these to be dependent upon the decrees of councils.

The Elector of the Palatinate having died in May 1685, and left his sister, the Duchess of Orleans, heiress of his movable property, Louis claimed for her also all the allodial lands; and from this and other causes arose a new European war. A French army invaded the Palatinate, Baden, Würtemberg, and Trèves in 1688. In 1689 the Lower Palatinate and neighbouring regions were laid waste by fire and sword. This atrocious proceeding led to a new coalition against France. Success for a time attended the French arms, particularly in Savoy and at the battle of Steinkerk. Reverses, however, ensued; the war was waged for years on a great scale, and with various success; and after the French, under Luxembourg, had gained, in 1693, the battle of Neerwinden, it was found that the means of waging war were very much exhausted, and Louis concluded the peace of Ryswick on 20th September 1697. The navy destroyed, the finances grievously embarrassed, the people suffering from want of food, and discontent becoming deep and general, Louis placed the Count D'Argenson at the head of the police, and established an unparalleled system of espionage for the maintenance of his own despotism. The power of Madame de Maintenon and her clerical advisers became more and more absolute at the court, where scandals of every kind increased.

When the death of Charles II. of Spain took place, on 1st November 1700, it was found that Louis had obtained his signature to a will by which he left all his dominions to one of the grandsons of his sister, who had been Louis's queen. Louis supported to the utmost the claim of his grandson (Philip V.), whilst the Emperor Leopold supported that of his son, afterwards the Emperor Charles VI. But the power of France was now weakened, and the war had to be maintained both on the side of the Netherlands and of Italy. One bloody defeat followed another; Marlborough was victorious in the Low Countries, and Prince Eugene in Italy; whilst the forces of Louis were divided and weakened by the employment of large bodies of troops against the Camisards in the Cévennes, for the extinction of the last relics of Protestantism.

On the 11th April 1713 peace was concluded at Utrecht, the French prince obtaining the Spanish throne, but France sacrificing valuable colonies. A terrible fermentation now prevailed in France, and the country was almost completely ruined; but the monarch maintained to the last an unbending despotism. He died, after a short illness, 1st September 1715. He was succeeded by his great-grandson, Louis XV. His son, the dauphin, and his eldest grandson, the Duke of Brittany, had both died in 1711. Louis had a number of natural children, and he had legitimised those of whom Madame de Montespan was the mother; but the Paris parliament, which made no objection to recording the edict when required by him, made as little objection to annulling it when required by the next government. The 'works' of Louis XIV. (6 vols. Paris, 1806), containing his Instructions for his sons, and many letters, afford important information as to his character and the history of his reign. The reign of Louis XIV. is regarded as the Augustan age of French literature and art, and it can hardly be doubted that France has never since produced poets like Corneille and Racine in tragedy, or Moliere in comedy, satirists like Boileau, or church orators and divines like Bossuet, Fenelon, Bourdaloue, and Massillon.

See Voltaire's *Siècle de Louis XIV.* (1740), the *Mémoires* of Saint-Simon (1788; in English, abridged, 1876); and other works by Gaillardin (6 vols. 1871-76), Cosnac (8 vols. 1874-81), Chérel (4 vols. 1878-80), Michelet (3d ed. 1875), Michand (1882-83), Chotard (1890), Du Cause de Nazell (1899), Pardoe (1886), Hassall (1895); for 'le style Louis Quatorze' in art. Genevay (1887).

LOUIS XV., king of France, the great-grandson of Louis XIV., born at Versailles, 15th February 1710, succeeded to the throne 1st September 1715. The Duke of Orleans, as first prince of the blood, was regent during the minority of the king, whose education was entrusted to Marshal Villeroi and Cardinal Fleury. The regent and the country became incomprehensibly infatuated with the financial schemes of the Scotsman Law (q.v.). All available capital was drawn away from agriculture and trade, pocketed by the financial cliques, the court, and the state, whose debt was thereby substantially reduced, and worthless paper-money issued instead. Every kind of indulgence in luxury and vice accompanied in high places this financial insanity. When Louis was fifteen years of age he married Maria Leszcynski, daughter of Stanislas, the dethroned king of Poland. At the death of the regent and of his shameless prime-minister Cardinal Dubois, Louis reigned personally, and put at the head of affairs his old, wise, and prudent teacher Cardinal Fleury, who repaired somewhat the economic disasters of his predecessors, and set his face against a warlike policy.

Louis having become involved in the war of the Polish Succession through his father-in-law, the duchy of Lorraine was without much fighting obtained for the latter, and for the French crown after him. When the war of the Austrian succession broke out (1740) Cardinal Fleury was averse to burdening the state with fresh debt and new military charges in support of the claims of the prince-elector of Bavaria to the imperial crown. Louis was then falling under the influence of a number of voluptuous and immoral noblemen, who set up a barrier between him and his wife, and delivered him into the hands of vice. Fleury lost ground; the government became a toy for ambitious courtiers and dissolute women, in the satisfaction of whose vanity war was declared against Austria. After a course of easy conquest in 1741 the French were badly beaten in 1742; regret and worry brought Fleury to the grave in the next year. But in the following years France, in alli-

ance with Frederick the Great of Prussia, was repeatedly victorious on land, at Fontenoy (1745), for instance, where Louis delighted his latest mistress with the flight of English, Dutch, and Austrian troops, though on the sea the English put an end to the French navy and sea-faring trade. When peace was signed at Aix-la-Chapelle France had nothing to show save the ruinous disorganisation of her finances.

The king now sank completely under the control of Madame de Pompadour, who was both concubine and procuress, and to whom he gave notes on the treasury for enormous sums, amounting in all to hundreds of millions of livres. War broke out again with Britain concerning the boundaries of Acadia (Nova Scotia), and was for some time prosecuted with considerable vigour. In 1756 an extraordinary alliance was formed between France and Austria, contrary to the policy of ages, and chiefly through the influence of Madame de Pompadour. Directed against Prussia as a threatening Protestant power, this alliance had no other result than Frederick the Great's complete victory over the French at Rossbach. The state of the finances, the dispirited condition of the army, and the outcry of the distressed people were not sufficient to induce the king to make peace; but, governed by his mistress, he obstinately persevered in war, even after the terrible defeat of Minden in 1759; whilst the British conquered almost all the French colonies both in the East and West Indies, with Cape Breton and Canada. A peace most humiliating to France was at last concluded in 1763.

Louis, although indifferent to the ruin of his people, and to everything but his own vile pleasures, was reluctantly compelled to take part in the contest between the Paris parliament and the Jesuits (q.v.), the result of which was the suppression of the order in 1764. The parliament, emboldened by success in this contest, now attempted to limit the power of the crown by refusing to register edicts of taxation; but the king maintained his own absolute and supreme authority, thanks to the indifference with which the people and the middle class viewed the privileges of the *noblesse de robe*. The Duc de Choiseul was now displaced from office, a new mistress, Madame du Barry, having come into the place of Madame de Pompadour; and a ministry was formed under the Duke d'Aiguillon, every member of which was an enemy of the parliaments and abjectly immoral. The councillors of the parliament of Paris were removed from their offices, and banished with great indignity; an interim parliament was appointed (January 1771), which duly obeyed the court. The princes of the blood protested against this arbitrary act, which left them without any means of appeal against the royal will. The king, when told of the ruin of the country and the misery and discontent of the people, only remarked that the monarchy would last as long as his life, and continued his course of sensual pleasures and trifling amusements. He boasted of being the best cook in France, and was much gratified when the courtiers ate eagerly of the dishes which he had prepared. His gifts to Madame du Barry, notwithstanding the embarrassment of the finances, in five years amounted to 180 millions of livres. At last Louis, whose constitution was already shattered from the effects of a life of vice, was seized with smallpox, and on 10th May 1774 he died in abject misery, so far from being regretted that his funeral was a sort of popular festival, and was celebrated with pasquils and merry ballads. Such was the end of Louis 'le Bien aimé.'

See Voltaire's *Siècle de Louis XV.* (2 vols. 1768-70), and other works by Tocqueville (2d ed. 1847), Bonhomme

(1873), the Duke de Broglie (Eng. trans. 1879), Vandal (1882), Perkins (1897), and Waddington (1897).

Louis XVI., king of France, born 23d August 1754, was the third son of the dauphin, Louis, only son of Louis XV. He was styled Duc de Berry until, by the death of his father and his elder brothers, he became dauphin. He had a vigorous frame, was fond of hunting and manly exercises, took great pleasure in making locks and such mechanical labours, and showed an aptitude for geometry but none for political science. In the midst of the most corrupt of courts he grew up temperate, honest, and moral. He was married on 10th May 1770 to Marie Antoinette, the youngest daughter of the Empress Maria Theresa.

When Louis ascended the throne the public treasury was empty, the state burdened with a debt of 4000 millions of livres, all borrowing credit was exhausted, the people were crushed under the weight of taxes, and all respect had gone from king, court, church, and governing classes. Personally full of good-will, he failed to restrain the excesses of his brothers and to resist the influence of his proud and high-handed consort. He yielded unwisely to the advice of his first prime-minister, Maupeau, an incompetent and narrow-minded courtier, in restoring to the Paris and provincial parliaments their semi-political rights in the matter of public expenditure and local taxation. The accession of Malesherbes and Turgot to the ministry heralded thorough-going reforms, which Voltaire hailed as the 'dawn of the age of reason' in French politics. But these proposals, accepted by the king, were rejected by the court, the aristocracy, the parliaments, and the church. Turgot resigned his office. Yet Louis succeeded in the remission of some of the most odious taxes, the abolition of the last relics of serfdom, the abolition of torture in judicial investigations, a reduction of the expenditure of the court, and the foundation of institutions for the benefit of the working-classes. He was for a time extremely popular, though deeper reforms were rendered impossible by the opposition of the privileged classes and the obstinacy of the queen. In June 1777, when the state of the finances seemed nearly desperate, Necker was made Director-general, and succeeded in bringing them to a more tolerable condition, without any very radical change; but, from the interference of France in the American war of independence, he was obliged to propose the taxation of the privileged classes hitherto exempted. Their resistance compelled him to resign. The American war swallowed up the revenue of three years. The appointment in 1783 of Calonne (q.v.), a spendthrift, to the finances renewed for a while the splendour of the court. At his wits' end, he advised the calling together of an Assembly of Notables, such as the monarchy, especially under Richelieu's premiership, had occasionally summoned to its help. The noblemen, clergymen, state-officials, councillors of parliaments, and municipal officers thus collected showed him bitter hostility, and, when he revived Necker's proposals, compelled him to fly to London. His successor, Loménie de Brienne, obtained some concessions and some new taxes. But the parliament of Paris refused to register the edict of taxation, as oppressive to the people; for the extravagance of the court and the queen began to be freely spoken of in a nation now fully acquainted with the facts. The convening of the States-general was demanded from every corner of France. The king registered the edicts in a *Lettre de justice*, and banished the councillors of parliament to Troyes, but ere long found it necessary to recall them, and experienced from them even a stronger opposition than before. On 8th May 1788 he dissolved all the parliaments and established a new kind of court

(*Cour Phœnix*) instead; but this act of despotism set the whole country in flames. Matters became still worse when on 16th August appeared the famous edict, that the treasury should cease from all cash payments except to the troops. Brienne was compelled to resign, and Necker again became minister. An Assembly of the States of the kingdom, in abeyance since 1614, was resolved upon; and by the advice of Necker, who wished a counterpoise to the influence of the nobility, clergy, and court, the Third Estate was called in double number, while in other respects the precedent set in 1614 was adhered to.

The subsequent history of Louis is given under the head FRANCE. All readers of history are familiar with the melancholy incidents of his life, from the opening of the Assembly of the States (5th May 1789) down to his tragic execution. At ten o'clock in the morning of the 21st of January 1793 he died by the guillotine, in the Place de la Revolution. Great precautions were taken to prevent any rescue. As the executioner bound him Louis tore himself free and exclaimed: 'Frenchemen, I die innocent; I pray that my blood come not upon France.' The rolling of drums drowned his voice.

The share of the French in the American war of independence is a bright and almost romantic episode in the drama of this reign. Franklin kindled in excitable Paris such enthusiasm for liberty and democracy that the Marquis de Lafayette and some other ideal-loving gentlemen crossed the sea in defence of England's colonies. A formal alliance ensued, and assistance was given in men, money, and ships.

See MARIE ANTOINETTE, NECKER, TUEGOT, MIRABEAU; and works by Soulaye (1801), Bourmisseaux (1829), Droz (2d ed. 1858), Capefigue (1844), Tocqueville (2d ed. 1830), and Jobez (3 vols. 1877-93).

Louis XVII., CHARLES, second son of Louis XVI. of France, born at Versailles, 27th March 1785, received the title of Duke of Normandy, till, on the death of his brother in 1789, he became dauphin. He was a promising boy. In the earlier days of the Revolution he was sometimes dressed in the uniform of the National Guard and decorated with the tricolor to gratify the populace. After the death of his father he continued in prison—at first with his mother, but afterwards apart from her—in the Temple, under the charge of a brutal Jacobin shoemaker named Simon, who treated him with great cruelty and pushed him into vicious excesses, so that he became a mere wreck both in mind and body. After the overthrow of the Terrorists he was, perhaps intentionally, forgotten, and died 8th June 1795. A report spread that he was poisoned, but a commission of physicians examined the body and declared the report unfounded.

All the attempts made by Louis XVIII. in 1815 to find the remains of this most hapless victim of the Revolution proved fruitless, and this fact gave room for the appearance of a succession of false dauphins, whose claims deluded many honest royalists in France. Of these the first was Jean Marie Hervagault, the son of a St. Lo tailor, born in 1781, who ran away from home at fourteen, and soon found many supporters in Brittany, Normandy, Champagne, and Burgundy. In 1802 he was sentenced for his imposture to a four years' imprisonment, and later, under Napoleon's empire, was confined in the Bicêtre, where he died in 1812. Another false Louis, who attracted some attention under the name Charles of France, was Mathurin Bruneau, born in 1784 at Bezins, the son of a maker of wooden shoes. He early took to a roving life, was committed as a vagrant in 1803, next spent some years in North America, returned to push his claims in France, and was sent to prison

for seven years at Ronen. After the July revolution he disappeared. The third false Louis XVII., who attracted much attention in 1833 and 1834, was the so-called Duc de Richmont, whose proper name was François Henri Hébert, a native of the Rouen district. The idea that he was a son of Louis XVI. first possessed him about 1828. After the July revolution he protested in a series of writings against Louis-Philippe, and attempted to push his claim by *Mémoires*. In 1834 he was sent to jail for twelve years, but eight months later succeeded in making an escape to London, where he died in 1845. Perhaps the most remarkable claimant was the Potsdam watchmaker, Karl Wilhelm Naundorf, whose claim rested on a striking Bourbon resemblance. After many crosses in Berlin, Spandau, and Brandenburg, besides a three years' imprisonment, he found his way to France in 1833, but was expelled three years later. He made his way to England, and died in 1845. His children assumed the name of Bourbon, and in 1851 and 1874 raised fruitless actions before the Paris law-courts against the Comte de Chambord. See Elizabeth Evans's *Story of Louis XVII.* (1893).

LOUIS XVIII., STANISLAS XAVIER, the next younger brother of Louis XVI., born at Versailles, 17th November 1755, received the title of Comte de Provence. In 1771 he married Maria Josephine Louisa, daughter of Victor Amadeus III. of Sardinia. After the accession of Louis XVI. to the throne he assumed the designation of *Monsieur*, and became an opponent of every salutary measure of the government. He fled from Paris on the same night as the king, and was more fortunate, for, taking the road by Lille, he reached the Belgian frontier in safety. With his brother, the Comte d'Artois, he now issued declarations against the revolutionary cause in France, which had a very unfavourable effect on the situation of the king. The two brothers for some time held a sort of court at Coblenz. Louis joined the body of 6000 émigrés who accompanied the Prussians across the Rhine in July 1792, and issued a manifesto even more foolish and extravagant than that of the Duke of Brunswick. After the death of his brother, Louis XVI., he proclaimed the latter's son king of France, as Louis XVII., and in 1795 himself assumed the title of king. The victories of the republic and Napoleon's enmity to the Bourbon family compelled him frequently to change his place of abode, removing from one country of Europe to another, till at last, in 1807, he found a refuge in England, and purchased a residence, Hartwell, in Buckinghamshire, where his wife died in 1810, and where he remained till the fall of Napoleon opened the way for him to the French throne. On 26th April 1814 'le Desiré,' as the royalists style him, landed at Calais, after twenty-four years' exile. His return, under the protection of the allied armies, had been prepared for by Talleyrand. Then began the ascendancy of the legitimist party. The powerless empress regent was superseded by a provisional government, the Napoleonic constitution was set aside, and, in keeping with the doctrine of the 'divine right of kings,' all power was claimed by Louis XVIII. Using his discretionary rights, he granted to the nation a constitutional charter, establishing a House of Peers and a Chamber of Deputies, and vouchsafing a few elementary citizen rights, but in every essential respect he resumed the baneful traditions of the ancient monarchy. See FRANCE.

The nobles and priests exercised an influence over the weak king which led to severe treatment of the Imperialists, the Republicans, and the Protestants. This opened the way for Napoleon's return from Elba, when the king and his family fled from Paris, remained at Ghent till after the battle of

Waterloo, and returned to France under the protection of the Duke of Wellington. He issued from Cambrai a proclamation in which he acknowledged his former errors, and promised a general amnesty to all except traitors. But the Chamber of Deputies, cleft with many irregularities, was so fanatically royalist and reactionary that the king, by advice of the Emperor Alexander of Russia, dissolved it; whereupon arose royalist plots for his dethronement and the abolition of the charter. Bands of assassins were collected by nobles and priests in the provinces, who slew hundreds of adherents of the Revolution and of Protestants, and years elapsed ere peace and good order were in any measure restored. Driven by royalistic fanatics, the king dismissed his too moderate prime-minister Decazes, and could not prevent an army from passing into Spain to maintain there the right of absolute kingship. He died 16th September 1824. See Petit's *Louis XVIII.* (1885).

LOUISA, queen of Prussia, was born 10th March 1776, at Hanover, where her father, Duke Karl of Mecklenburg-Strelitz, was then commandant. She was married to the Crown-prince of Prussia, afterwards Frederick-William III., on 24th December 1793, and was the mother of Frederick-William IV. and William III., afterwards emperor. After her husband's accession to the throne she became exceedingly popular, her great beauty being united with dignity and grace of manners, and with much gentleness of character and active benevolence. This popularity was increased by her conduct during the period of national calamity that followed the battle of Jena, when she displayed not only a patriotic spirit, but no little energy and resolution. She especially endeared herself to her people by her bearing when compelled to endure insult at the hands of Napoleon. She died in Strelitz, 19th July 1810. The Prussian Order of Louisa, the Louisa School for girls, and the Louisa Governesses' Seminary were instituted in her honour. There is a beautiful monument and portrait-statue of her by Rauch in the mausoleum at Charlottenburg. See her *Life and Times*, by E. H. Hudson (1877), and German works by Horn (1883) and Martin (1887).

LOUISBURG, a port on the south-east coast of Cape Breton Island, Nova Scotia, 27 miles S.E. of Sydney. It is now inhabited only by a few fishermen; but there are the ruins of the old town, which under the French had a large export trade in coal, and was the strongest fortress in North America, until taken by the English in 1758. It had already been captured by the New England colonists and an English squadron in 1745, and restored in 1748; now its fortifications, which had been thirty years in building and cost over a million sterling, were demolished, and it gradually sank into ruin.

LOUIS-D'OR (i.e. 'Golden Louis'), a gold coin which was introduced into France in 1641, and continued to be coined till 1795. The louis-d'or ranged in value from about 16s. 7d. to 18s. 9½d. sterling.—In some parts of Germany, in the old coinage, were gold pieces of five thalers, often popularly called *louis-d'or*, and the name has been occasionally applied to the French *napoleon* or *20-franc piece*.

LOUISIADÉ ARCHIPELAGO, a group of islands belonging to British New Guinea, and forming an eastward extension of that island. It embraces Sudest (45 miles long by 4 to 10 miles wide), Rossel, St Aignan's (28 miles long by 8 to 9 miles wide), and a vast number of smaller islands. All are mountainous, rising to 3500 in St Aignan's, and covered with vegetation. The inhabitants are

numerous, but wild, and head-hunters; they seem to partake of both Malayan and Papuan characteristics.

Louisiana, one of the Gulf states of the American Union, extends about 200 miles from north to south and 200 from east to west. Its land area, including the marshes bordering on the Gulf, is 40,790 sq. m.; its inland waters cover 2328 sq. m.; total area, 43,118 sq. m. This area is divided nearly equally between alluvial lands and uplands. The mean elevation of the state above sea-level is 75 feet, its highest point 484 feet. For 25 miles inland from the Gulf, marshes subject to tidal flow cover one-eighth of the state's entire surface; low, sandy pine flats and prairie lands occupy about one-eighteenth each, arable lands one-eighth, the flood-plains near the rivers one-tenth, and bluff lands, pine hills, and uplands more than one-fifth each. Most of the large rivers flow above the level of the surrounding country on ridges formed by their own deposits, and the plains around, protected by dykes (called levees), slope away into dense, wooded swamps. The bottom-lands of the Mississippi are from 20 to 70 miles in breadth, those of the Red, Ouachita, and other streams range from 6 to 20 miles. But although the flood-plains lie below, there is a large area above the rivers' high-water mark. The uplands embrace all the northern and north-eastern parts of the state, inclining gently towards the south, and crossing these are bluff lands, extending through the alluvial lands to the Gulf, and forming wonderful 'islands' covered with vegetation. Nor is the immense plain surrounding these bluffs ever inundated, but elevated and fertile, traversed by deep bayous (as minor and tributary streams are called here). Even in the coast marshes occasionally an island-hill rises, with soil firm and fertile; and at other points cattle graze, whilst thousands of acres yearly are being drained and reclaimed and planted with rice. Besides the Mississippi the chief rivers are the Red, Sabine, Ouachita, and Pearl; the entire river navigation of the state reaches nearly 3800 miles, and there are also several considerable lakes.

The mean temperature of Louisiana is from 60 to 75 F., the climate being softened by the waters within and around the state, the profuse rainfall (47 to 73 in.), and the breezes from the Gulf. The vegetation in most parts is luxuriant. The forests are dense with trees—pine, cypress, oaks, cottonwood, magnolia, poplar, beech, &c. Fruits are abundant, oranges and figs the most important. The staple crops are cotton, sugar, rice, and maize. The Louisiana cotton crop is about a tenth of the whole crop of the Union; its rice crop is a half of the total produce of the States; and in some years the sugar crop of the state makes 95 per cent. of the produce of the Union. Wine is also made.

The principal manufactures are shingles and tanks, cotton-seed oil, machinery, tobacco, and clothing and boots and shoes (by machinery), besides the cleaning and polishing of rice and the refining of sugar and molasses. The only mineral of importance is rock-salt, which is found in inexhaustible quantity at Petit Anse on Avery's Island; but hematite iron ore and sulphur have also been discovered, besides lignite of little, if any, value.

Louisiana is divided, not into counties, but parishes to the number of 59. The other officials are elected in the usual manner, but the judges of the supreme court are appointed by the governor for a term of twelve years. Those of the courts of appeal are elected by the General Assembly for eight years, and in the country districts and in New Orleans the judges of the district courts are appointed by the governor, being elsewhere elected for four years. The civil law prevails in Louisiana,

a code based on the Code Napoleon having been adopted in 1825. The state returns six members to congress. Education is fairly well provided for, and increased attention is being devoted to the free schools. The State University and Agricultural and Mechanical College is at Baton Rouge, the State Normal School at Natchitoches; the Southern University, at New Orleans, is endowed by the state, and in the same city is the Tulane University, with departments for ladies and for training in the manual arts. See NEW ORLEANS.

The state forms part of the province of Louisiana, purchased from France in 1803, which occupied an enormously larger area than the state—namely, the whole western basin of the Mississippi from Mexico to the Canadian lakes. (See UNITED STATES, and the map there at p. 388.) In 1682 La Salle (q.v.) sailed down the river and claimed the country for France, naming it Louisiana in honour of Louis XIV., and planting a colony at a point 38 miles below the present site of New Orleans. After an unsuccessful attempt at colonisation by Iberville, the territory was handed over to the Mississippi Company, under John Law (see MISSISSIPPI SCHEME), and New Orleans was founded. The company collapsed in 1720, and Louisiana reverted to the crown in 1732. It was ceded to Spain in 1762, retroceded to France in 1800, and sold to the United States by Napoleon, for 60,000,000 francs, three years later, being admitted as a state in 1812, although the portion between the Mississippi and Pearl rivers was not actually acquired until the Florida purchase of 1819. The battle of New Orleans (8th January 1815) and several changes in the constitution are the only noteworthy events in its history until the civil war. Louisiana seceded in January 1861, and New Orleans was captured on 24th April 1862. More than a hundred battles were fought within the limits of the state, leaving ruin behind, whose effects are felt to this day. Prosperity, however, is returning, and is established on a basis more sound and satisfactory than of old. The finances of the state are in a healthy condition, her bonds nearly at par. Since 1877 political disturbances and outbreaks which had followed the period of reconstruction have ceased, railways have been extended, and the assessed valuation of property enormously increased; and Louisiana's chief troubles have been from the bursting of the levees, although none have proved so disastrous as the terrible flood of 1874, when one-sixth of the state was inundated. See C. Gayarre, *History of Louisiana* (3d ed. 4 vols. New Orleans, 1885).

Population.—The principal cities are New Orleans, Shreveport, Baton Rouge (the capital), and Monroe, all the subject of separate articles. The population is very mixed. The negroes in the country districts are somewhat in excess of the whites, of whom about one-sixth each are of French (some Acadian), German, or Irish descent. Those of French descent are called Creoles—a term which in Louisiana does not imply any admixture of African or Indian blood. There are also a number of Spanish and Italian descent. In most of the southern parishes French is habitually spoken by the people; and Spanish also is still retained. Pop. (1820) 153,407; (1860) 708,002, including 326,726 slaves and 18,527 free coloured people; (1880) 939,946; (1890) 1,118,587.

Louis Napoleon. See NAPOLEON.

Louis-Philippe, king of the French, born in Paris, 6th October 1773, was the eldest son of Louis-Philippe Joseph, Duke of Orleans. He received at his birth the title of Duke of Valois, and afterwards that of Duke of Chartres. His education was entrusted to the care of the cele-

brated Madame de Genlis. He entered the National Guard, and became a member of the Club of Friends of the Constitution, afterwards that of the Jacobins. Along with his father, he renounced his titles, and assumed the surname of Egalité. He showed both courage and capacity in the wars of the republic; but his situation became very dangerous after the unsuccessful battle of Neerwinden (1793), in which he commanded the centre. He was included in the order for arrest issued against his general-in-chief, Dumouriez, and on the 4th April escaped along with him into the Austrian territory. He sought in Switzerland a place of security for his sister Adelaide, wandered about amongst the mountains for four months, and accepted a situation as teacher of geography and mathematics in a school at Reichenau, near Chur, assuming the name of Chabaud-Latour. He afterwards wandered for some time in the north of Europe, and then went to the United States, where he spent three years. In 1800 he took up his abode at Twickenham, near London, with his two younger brothers, both of whom soon after died. In 1809 he married Marie Amelie, daughter of Ferdinand I. of the Two Sicilies. On the fall of Napoleon he hastened to Paris, where he was received with distrust by Louis XVIII. After the second Restoration he recovered his great estates, which the imperial government had sequestrated. Disliked by the court, he was very popular in Paris. The revolution of 1830—the 'July revolution'—having ended in a victory of the constitutional party over the republicans, he was appointed lieutenant-general, mainly on the proposal of the banker Lafitte and of General Lafayette. Throwing to the winds the divine right of the Bourbons, he accepted to reign as the elect of the sovereign people, under the tricolor flag of the republic and of Napoleon. He had against him the ultra-royalists and the republicans, and identified his rule with the *bourgeoisie*, who supplied him with a policy, ministers, and money, in return for their ascendancy. He was dubbed with the nickname of *roi-citoyen*, his system was called that of *Justice-milieu*, and his advisers were set down as *doctrinaires*. He reigned for the material interests of France, and for those of the House of Orleans; himself a most wealthy king, the country prospered under his rule, and the middle classes amassed considerable riches. Unfortunately, his kingship rested on a democratic basis, to which it grew more and more untrue. The revolution of 1830 had been an event of European importance, and rang in a revival of liberalism in many states where Louis-Philippe would have thought it quixotic to give it diplomatic or military assistance. Nor could he countenance the socialistic and communistic doctrines made popular among the republicans at home by Proudhon, Louis Blanc, and others. The parliamentary franchise rested on a franchise which limited the electors to the aristocracy of wealth and their hangers-on. The peasantry and working classes were ignored, and left a prey to political agitators. The political corruption of the *bourgeoisie*, and its wholesale bribery by the king, united all extremists in a cry for electoral reform. Louis-Philippe ran the gauntlet of eight attempts at murder, which all failed. A man of great ability, but of little character, he was by fear carried, with his ministers, into paths of reactionary violence. The royalistic statesman Royer-Collaud joined Odilon Barrot and the republican Left in resistance to the muzzling of newspapers. Trial by jury was tampered with. Prince Louis-Napoleon Bonaparte seized this opportunity of acting twice the part of a pretender (1836, 1840). The Duke of Orleans' death in 1812 left the throne without a direct heir apparent.

Republicans, socialists, communists became more and more threatening. In vain did Louis-Philippe provide, by campaigning in Algeria, an outlet for the military spirit of his subjects; in vain did he fix their attention on foreign affairs by supporting the kingship of Mehemet Ali in Egypt. A home-policy of reform banquets, hit upon by the republican leaders as their most suitable form of attack, and severely repressed on the part of the government by recourse to an obsolete law of the 'ancien régime,' led to violent debates in the Chamber, in which Thiers, then in the opposition, helped to weaken the position of the prime-minister Guizot. Yet parliamentary means were about to foil the republican deputies, when the Paris mob rose in arms on the 22d and 23d of February 1848, with the complicity of the regular troops, the national guards, and the municipal police. Louis-Philippe dismissed Guizot, and promised reforms; but it was too late. He was compelled to abdicate, and, amidst the indifference of almost every Frenchman to his fate, ended a reign remarkable for the wave of liberalism in which it took its rise and the whirlwind of democracy that swept it away. Deserted by his courtiers, he fled to the coast of Normandy along with his queen, concealed himself for some days, and at length escaped to Newhaven under the name of Mr Smith. He died at Claremont, 26th August 1850.

See the articles BOURBON, FRANCE, GUIZOT, ORLEANS (DUKE OF); works by the Marquis de Flers (1892) and Imbert St Amand (1893), Crétineau-Joly (2 vols. 1862), A. Dumas (2 vols. 1852), Nouvion (4 vols. 1861), Villault de Germainville (3 vols. 1870-76), Vantbault (1889), Villeneuve (1889), and Hamel (1890).

Louisville, the largest city of Kentucky, a port of entry and capital of Jefferson county, is situated on the Ohio, 130 miles below Cincinnati. The river here forms a series of rapids—the 'Falls of the Ohio'—descending 22 feet in 2 miles; except at high water steamboats pass these by a canal. The city, which covers about 20 sq. m., is handsomely built, with wide and regular streets, on a level plain, and sloping up from the river. It has a Roman Catholic cathedral and 150 other churches, a law school, four medical colleges, colleges of dentistry and of pharmacy, a school of pharmacy for women, and a good system of public schools. Here also is the State institution for the blind; altogether there are some forty public and private charitable institutions. Louisville is the greatest market for tobacco in the world, and has large pork-packing establishments, distilleries, and tanneries. Extensive manufactures of ploughs, furniture, castings, gas and water pipes, machinery, flour, and cement are also carried on. The city is the terminus of a number of railway lines; the Ohio is crossed here by two railway bridges, one of them nearly a mile long. Louisville was founded in 1778, and in 1780 named in honour of Louis XVI. of France, whose troops were then assisting the Americans in the war of independence. A great part of the town was destroyed by a cyclone in March 1890. Pop. (1880) 123,758; (1890) 161,165.

Loulé, a town in the extreme south of Portugal, 10 miles from the coast. Pop. 14,418.

Jumping-ill, or TREMBLING, a disease epidemic or endemic in sheep and lambs in cold spring weather, characterised by tremblings, loss of power, contraction of the gullet, and odd motions like involuntary 'jumping' (leaping). The brain is affected, and sometimes the lungs and heart.

Lourdes, a French place of pilgrimage in Hautes Pyrénées, 12 miles SSW. of Tarbes by rail. Pop. 6517. The town nestles at the foot of a high rock on a plain bounded to southward by the foot hills of the Pyrénées. The site was a Roman

military station, and was successively held by Vandals, Visigoths, Franks, Basques, Saracens, Albigenses, English (after 1360), and the lords of Be. en. Here, in a niche above one of the caves of the Massabielle rocks, the Blessed Virgin is said to have appeared at noon on the 11th February 1585 to a poor girl fourteen years of age, called Bernadette Soubirous; the apparition was seventeen times repeated during the succeeding six months. A spring rising from the spot, which was hitherto unknown to exist, was endowed with miraculous powers; and many miracles were reported. Crowds flocked to the place; and the barriers erected by the sceptical local authorities (1858) were soon afterwards removed by command of the emperor. The Bishop of Tarbes then appointed a commission of ecclesiastics and scientists to inquire into the extraordinary events that had occurred at Lourdes during the last six months. After investigations extending over three years, the commission decided in favour of the apparition of the Blessed Virgin Mary, the ecstasies of Bernadette, and the miracles wrought by the water of the spring. A great basilica (1876) now adorns the scene of the miracles, and on a level with its crypt has been added the church of the Rosary (1889) for the accommodation of the pilgrims who visit the spot. The most important pilgrimage is the National pilgrimage in August, numbering, in 1897, 60,000 persons. The miracles and other notable occurrences are duly recorded in the *Annales de Lourdes*, conducted by the Fathers of the Immaculate Conception, to whose care the grotto and its appurtenances have been confided.

See works on the subject by H. Lasserre; Colin (1889); Father Clarke, S.J. (1887); Barbe (trans. by Alice Meynell, 1894); and Zola's famous novel, *Lourdes* (1894).

Loourenço Marques, or LORENZO MARQUES, a Portuguese station on Delagoa Bay, east coast of Africa. Pop. (1896) 2692, of whom 1544 were Portuguese, English, Italians, &c. It is the terminus of the railway to Pretoria, which was open to the Transvaal frontier (52 miles) in 1887, and all completed in 1895. In the Boer war of 1899-1900 it was the scene of much intrigue, and hence Kruger sailed to Europe. See DELAGOA BAY.

Louse and **Lousewort**. See LICE, PEDI-CULARIS.

Louth (pron. soft *th*, as in *lath*), a maritime county of the province of Leinster, and the smallest county in Ireland, is washed for 49 miles on the east, from Carlingford Lough to the river Boyne, by the Irish Sea. The average width of the county is 10 miles. Pop. (1841) 128,240; (1881) 77,684; (1891) 71,638. Area, 202,123 acres—89,815 under tillage. Potatoes, oats, barley, and turnips are the principal crops; 40 per cent. of the total area is under grass. The surface is flat, with the exception of a range on the north, which culminates in Carlingford Mountain (1935 feet), overlooking the bay of that name. The soil of the level districts is fertile, and agriculture reaches a high state of efficiency. Coarse linens are manufactured. The fisheries are valuable, especially the oyster-fishing in Carlingford Lough. The chief towns are Drogheda, Dundalk, and Aubree. Louth, which anciently formed part of the territory of Orgial or Arghal, was occupied by De Courcy in 1183, and formed into a county by King John in 1210. It abounds with Celtic antiquities, some of great interest. There are two round-towers, at Monasterboice and at Dromiskin. At Mellifont are the remains of a beautiful abbey. In Drogheda several ruined abbeys are still visible, as also at Louth and Carlingford. But the most interesting of all the relics of antiquity are the sculptured crosses of Monasterboice, of which the larger is 18 feet in

height. The county returns two members to the imperial parliament.

Louth (hard *th*, as in *lath*), a municipal borough of Lincolnshire, on the rivulet Lual, at the foot of the Wolds, 27 miles E.N.E. of Lincoln, contains a beautiful parish church in the Perpendicular style, built in the 13th and rebuilt in the 15th century, with an octagonal spire (1501) 288 feet in height, 'one of the noblest in England,' and an Edward VI. grammar-school. Ruins of Louth Park Abbey, built by the Cistercians in 1139, exist $\frac{1}{2}$ mile E. of the town. Iron foundries, carpet-factories, breweries, and carriage-works are in operation. Louth is connected with the Humber by a canal (1761). Pop. (1851) 10,467; (1891) 10,040. See the corporation records, ed. by Goulding (1892).

Louvain (Ger. *Löwen*, Flemish *Leuven*), a city in the Belgian province of Brabant, 19 miles by rail E. of Brussels. In the 14th century the town was rich, prosperous, and large (200,000 inhabitants), due to its cloth manufactures and its position as the capital of Brabant (from 994). In 1382 the townsmen revolted against their rulers, and the harsh punishment meted out to them drove large numbers away to England. The town was the seat of a celebrated university, founded in 1426. In the next century it had 6000 students, but was suppressed in 1797. Reconstituted in 1817, it was in 1835 transferred to private hands, but is still a Catholic university, with about 1600 students. The library contains 250,000 vols. The old walls, forming a circuit of five miles, have been demolished. The modern town covers only part of the enceinte, the rest being occupied by gardens. A statue of Father Damien was erected in 1894. A severe blow was struck at Louvain's prosperity by a terrible visitation of the plague in the 16th century. The modern industry is confined chiefly to bell-founding, brewing, and the manufacture of leather, paper, lace, starch, and chemicals. The town-house is a richly-decorated Gothic building (1448-69); the church of St Peter has a beautiful flamboyant roof-loft, a wrought-iron chandelier by Quentin Matsys, and some good pictures; in St Gertrude's Church are fine carved oak stalls. The Weavers' Hall (1317) was appropriated by the university in 1679. Pop. (1877) 33,917; (1891) 40,698. In 891 King Arnulf gained here a great victory over the Northmen, and built a castle against them. It used to be known as Caesar's Castle; a few fragments of it still remain. See Histories by Pict (1839) and Molanus (1861).

Louviers, a town in the French department of Eure, 16 miles S. of Rouen, has a Gothic cathedral of the 13th to the 15th century, and celebrated cloth (since 1681) and ticking manufactures, besides spinning-mills, dye-works, &c. Pop. 9273.

Louvois, FRANÇOIS MICHEL LE TELLIER, MARQUIS DE, the war-minister of Louis XIV., was born in Paris, 18th January 1641. His father was Chancellor and Secretary of State in the war department; the son joined him as assistant-secretary in 1662, and became war-minister in 1668. The first great task he set himself was to organise the armies of France. He created a standing army, gave it a corps of officers recruited by compulsion from among the nobility, established commissariat and hospital services, and founded the *Hôtel des Invalides* and various orders of merit. In the drilling of the armies he had a ready agent in Martinet, whose name is not yet forgotten in military life. His labours bore their fruit in the great war that ended with the peace of Nimeguen (1678). During the following years Louvois took a leading part in the capture of Strasburg, in 1681, in time of profound peace, and in the persecution of the Protestants through the

dragonnades after the Revocation of the Edict of Nantes. Louvois, a man of strong will, was overbearing and autocratic, brutal and cynical, unscrupulous in his means, but consistent and single in his aims—the aggrandisement of France and the maintenance of his own position. He died suddenly on 16th July 1691. See Life by C. Rousset (6th ed. 4 vols. 1879); and Chotard's *Louis XIV., Louvois, Vauban* (1890).

Louvre (Fr. *Louvre*, 'the opening'), an ornamental opening of a turret shape, placed on the roof, to allow the smoke or foul air to escape from large apartments, such as halls, kitchens, &c. These were particularly required in ancient times, when the fire was placed in the centre of the room, and there was no chimney to carry off the smoke. They are frequently used as ornaments where not required for use, and are then glazed and made into lanterns (q.v.). The sides of the louvre were lined with horizontal overlapped boarding, with a space between the boards, which let out the smoke without

Louvre.

admitting the rain. Hence, this sort of boarding, frequently used for the windows of bell-towers, &c., acquired the name of *louvre-boarding*.—For the palace of the Louvre, see PARIS.

Lovage (*Ligusticum*), a genus of plants of the natural order Umbellifera, allied to Angelica; the fruit is elliptical; each carpel has five sharp somewhat winged ribs; and there are many vittæ in the interstices. Common Lovage (*L. officinale*, or *L. Levisticum*) is a native of the south of Europe, with ternate decomposed leaves, and obovate, wedge-shaped leaflets. It is sometimes cultivated in gardens, and, notwithstanding its strong and peculiar odour, is used as a salad plant. Its roots and seeds are aromatic, acrid, and stimulant, and are used to cure flatulency and to excite perspiration. A liquor called *lovage* is made from them.—Very similar in appearance and qualities is the only British species, Scottish Lovage (*L. scoticum*), a native of the sea-coasts. It is eaten, both raw and boiled, by the Shetlanders. The flavour is aromatic, but acrid and very nauseous to those unaccustomed to it.

Lovat, SIMON FRASER, LORD, was born about 1676 at Tanich in Ross-shire. About the beginning of the 14th century his ancestor and namesake, after whom the clan Fraser were called in Gaelic *MacShim*, 'sons of Simon,' had migrated from Tweeddale to Inverness-shire; and Hugh, his grandson, had been made Lord Lovat in 1131. Our Simon was educated at King's College, Aberdeen, took his M.A. in 1695, having the year before accepted a commission in a regiment raised for King William. In 1696 his father, on the death of his grand-nephew, Lord Lovat, assumed that title; and Simon next year attempted to abduct the late lord's daughter and heiress, a child only nine years of age. Failed in this, he seized and forcibly married her mother, a lady of the Athole family—a crime for which he was found guilty of high treason and outlawed. After four years of petty rebellion (during which, in 1699, he succeeded his father as twelfth Lord Lovat),

on Queen Anne's accession, in 1702, when the Athole family became all-powerful, he fled to France, but a twelvemonth later returned to Scotland as a Jacobite agent. He was at the bottom of the 'Queensberry plot,' in which he professed to reveal the policy of the exiled court and a plan for a Highland rising; but the discovery of his duplicity obliged him once more to escape to France. There, by one (the more probable) account, he was kept for some years a prisoner at Sammar; by another, turned Jesuit, and became a popular preacher. He was still the darling of his clan; and in 1714 they sent Major James Fraser as a sort of ambassador to bring him over. Next year his cousin's husband, the holder of the estates, having joined the rebellion, Simon found it his interest to take the government side; his clan at once left the insurgents; and for this good service he obtained a full pardon, with possession of the Lovat territory. His life for the next thirty years was active in intrigues for the consolidation of his influence; and the man who had heretofore had audience with Mary of Modena and the Grand Monarque now sought and obtained a sponsor for his first-born in George I. In the '45 Lovat tried to play a double game, sending forth the clan under his son to fight for the Pretender, whilst to his friend and neighbour, Duncan Forbes of Culloden, he made constant professions of loyalty. Culloden lost, and his castle fired by Cumberland's soldiery, he fled to an island on Loch Morar, where he was found hiding in a hollow tree. He was brought up to London, on the way being sketched at St Albans by his friend Hogarth, and, after trial by impeachment before the House of Lords, was beheaded on 9th April 1747. At his trial he defended himself with ability and dignity, and he met death gallantly, Horace's line on his lips, 'Dulce et decorum est pro patria mori.' He is buried in the Tower. A finished courtier, a good scholar, and a most elegant letter-writer, Lovat was also a ruffian, a liar, a traitor, and a hypocrite. A cultured savage, he stands as the incarnation of the clan system at its worst, the very opposite of Scott's 'Fergus MacIvor.' During the lifetime of the lady he had ravished he twice more married—in 1716 Margaret, daughter of the Laird of Grant, by whom he was father of Colonel Simon Fraser (1726-82) and three others; in 1733, Primrose Campbell, of the Argyll family, whom he had inveigled into a house of ill-fame in Edinburgh, and who also bore him a third son, Colonel Archibald Fraser (1736-1815).

See Hill Burton's *Life of Lovat* (1847), and works there cited; also the Autobiography of Dr Alexander Carlyle, Sir W. Fraser's *Chiefs of Grant* (1883), Mr Henderson's article in the *Dict. of Nat. Biography* (vol. xx. 1889), and *Major Fraser's Manuscript*, edited by Colonel A. Fergusson (2 vols. 1889).

Love, FAMILY OF. See FAMILY OF LOVE.

Love-apple. See TOMATO.

Love-bird, a name given to various small parrots, but especially to those included in the genus *Agapornis*. These are at home in the forests of the Ethiopian region, are predominantly green in plumage, and are very affectionate both in their native haunts and in captivity. The name is, however, extended to the species of other genera and from other regions.

Lovedale, an important educational and mission station in South Africa, 650 miles N.E. of Capetown, and about 40 miles W. of King William's Town. It was founded in 1841, and has been generously supported by the Free Church of Scotland. Besides giving a general education,

it aims specially at training teachers for native schools, and teaching such arts of civilised life as printing, bookbinding, telegraphy, smith and carpenter work, and the like. Its highest numbers—490 in 1876—have not since been equalled. There was printed at Lovedale in 1887 a brief individual record of over 2000 natives, as well as a few hundred Europeans, who had been educated here, and the result was creditable in a surprising degree to the institution. See KAFFERS.

Love-feasts. See AGAPE.

Lovelace, RICHARD, Cavalier lyricist, was born at Woolwich in 1618, the eldest son of a Kentish knight of old family. Wood tells us he had his education at the Charterhouse, and at Gloucester Hall, Oxford, where his uncommon beauty and graceful yet modest manners made him the darling of the fair. Naturally he found his way to court, and went on the Scotch expedition in 1639, after which he retired awhile to his estate. In April 1642 he was committed to the Gatehouse at Westminster for presenting to the House of Commons a petition from the royalists of Kent 'for the restoring the king to his rights, and for settling the government,' and was only released on bail of £40,000. In the *Journals* of parliament this large sum is put as *personal bail* to the extent of £10,000, with a *society* for £5000. Thus Lovelace throughout the struggle was confined to the mortifying part of a prisoner on parole, but he spent his estate in the king's cause by furnishing money to his brothers and friends. In 1646 he took part in the siege of Dunkirk, and was flung into prison on returning to England in 1648. During this imprisonment he revised his poems, and in 1649 published *Lucasta*, the name formed from *Luc casta*, his epithet for his love, Lucy Sacheverell, who married, says Wood, another on the stray report that Lovelace had died of his wounds at Dunkirk. After the king's execution he was set at liberty, but his estate was spent, and his last years were darkened by dejection and distress. He closed the tragedy of his life in a mean lodging in Gunpowder Alley, near Shoe Lane, in 1658. Next year his brother collected his poems as *Lucasta: Posthumous Poems* (1659). His tragedy, *The Soldier*, and his comedy, *The Scholar*, were never published, and are lost. Most of Lovelace's work is slovenly, obscure, and in-spid, but his name survives secure of its immortality from two of the most faultless lyrics in the language—'To Althea from Prison' and 'To Lucasta on going to the Wars.' The best edition of his poems is that edited by W. C. Hazlitt (1864).

Love-lies-bleeding. See AMARANTH.

Lover, SAMUEL, artist, novelist, song-writer, and dramatist, was born in Dublin, the son of a Protestant stockbroker, 24th February 1797. In 1818, after three years' study, he established himself there as a marine painter and miniaturist; and to about the same date belongs his debut in literature, though it was not till 1832 that his first book appeared, *Legends and Stories of Ireland*, illustrated, like many of its successors, with his own etchings. *Rory O'More* (1836) at once became popular, and, as dramatised by him, ran through 108 nights; still, its success has been quite eclipsed by *Heavenly Body* (1842), a rollicking story of Irish life. Meanwhile, in 1837, Lover settled in London, and wrote much for the periodicals, till, in 1841, his eyesight beginning to fail, he started an entertainment, called 'Irish Evenings,' which was a hit both at home and in America (1846-48). In 1856 he received a pension; and he died at St Helier, Jersey, 6th July 1868. Of his songs may be mentioned 'The Angel's Whisper,' 'Molly Brown,' 'The Low-backed Car,' and 'The Four-leaved Shamrock.' See LIVES by Bernard (1874) and Symington (1880).

Low Archipelago, the most easterly group of Polynesian islands, known also as Paumotu, Tuamotu, Pearl or Dangerous Islands. They are about eighty in number, very flat and thinly peopled (8000 in all), and surrounded by coral atolls. Since 1846 they are under a French protectorate. There are rich pearl-fisheries off these islands. See POLYNESIA.

Low Countries, the Netherlands. See HOLLAND, BELGIUM.

Lowe, SIR HUDSON, the custodian of Napoleon in St Helena, was born at Galway, 28th July 1769. Entering the army in 1787, he served in various parts of the Mediterranean, and in 1808 capitulated at Capri to the French. But in the following year he helped to conquer Zante and Cephalonia, and then for nearly two years acted as governor of Santa Maura, Ithaca, and Cephalonia. He was afterwards for some time attached to the Prussian army commanded by Blücher. On 14th April 1816 he reached St Helena as governor of the island. Napoleon had landed there on the 17th October of the previous year. The strictness of Lowe's watch upon the disturber of the peace of Europe brought down upon him much obloquy, and exposed him to bitter and rancorous attacks from Napoleon's friends and admirers, especially from O'Meara (*Napoleon in Exile*, 1822). He was even assaulted in London in 1822. His defence of his conduct and acts may be read in his *Memorial relatif à la Captivité de Napoléon à Ste-Hélène* (2 vols. Paris, 1830) and in W. Forsyth's *Captivity of Napoleon at St Helena* (3 vols. 1853). In 1825 Lowe became commander of the forces in Ceylon. He died 10th July 1844. See NAPOLEON; and R. C. Seaton, *Sir Hudson Lowe and Napoleon* (1898).

Lowe, ROBERT. See SHERRBOOKE.

Lowell, a manufacturing city of Massachusetts, the birthplace of Whistler, on the Merrimack River, and at the junction of several railways, 25 miles N. by W. of Boston. The site is uneven and hilly, and the river falls 33 feet, affording great hydraulic power, which is controlled by a chartered company. Steam-power, however, is now extensively used in the large mills and workshops. These, the principal of which are also in the hands of corporations, include a great number of cotton and woollen factories; 2,500,000 yards of cotton are produced here in a week. Among the other manufactures are leather, paper, and iron goods, chemicals, carriages, &c. Lowell was incorporated in 1826. The operatives were for years gathered from the rural districts fifty or a hundred miles round, and lived in boarding-houses built and owned by the corporations, and kept under strict management. Foreign emigration has brought a large resident manufacturing population. Evening and technical schools, reading-rooms, a free library, and lectureships are maintained, and unusual attention is paid to the well-being of the work-people. Pop. (1880) 59,485; (1890) 77,696.

Lowell, JAMES RUSSELL, poet, essayist, and diplomatist, was born in Cambridge, Massachusetts, February 22, 1819. His copyright acts came of a family distinguished in many ways. His father, a friend of Cooper at Channing's, was minister of the West Church in Boston. The future poet entered Harvard College in his sixteenth year and graduated in 1838, but without any special rank. His abilities, however, were early recognised; all his youthful contemporaries were sure of his coming fame. His father had an unusually large library, not restricted to theological subjects, and the son was left to browse in it. The variety and extent of his reading was the foundation of his future scholarship, and the source of those stores of allusion and anecdote for

which his writings and conversation are equally remarkable. The severe studies which made him a scholar came long after his university course.

In his twenty-second year he published *A Year's Life and other Poems*. He studied law, but never seriously sought to practise. In company with Robert Carter, in 1843, he edited *The Pioneer*, a monthly magazine, with Hawthorne, Poe, and Whittier for contrilators; but after three issues the publishers failed. In 1844 he published a second volume of poems, in which were seen growing power and greater promise. In the same year he married Maria White, a beautiful and intellectual woman, herself the author of some charming poems. In 1845 he published *Conversations on the Old Poets*, an original and suggestive book, but immature in style and treatment. In 1846, at the outbreak of the Mexican war, he published a satiric poem in the Yankee dialect, purporting to have been written by a rustic named Hosea Biglow, and edited by the Rev. Homer Wilbur, an amusing pedant, in which the policy of the pro-slavery party and the conduct of the United States government toward an unoffending neighbour were held up to scorn and ridicule. It was apparently a trifle, but it had immediate and universal success; and from this slight beginning came the *Biglow Papers*, perhaps the highest expression of the poet's genius, and beyond doubt the first of modern satires in English. It is the soul of New England character; racy with its droll humour, and sparkling with its unborrowed wit; but its rare qualities are fully appreciated only by those to whom the rustic life and the dialect are familiar.

The year 1848 was productive and memorable. It was the year of European revolutions and of boundless hopes among enthusiasts for the future of mankind. A great many serious poems were written at this time, and formed a third volume. He wrote *The Vision of Sir Launfal*, one of the best, as it is one of the most popular, of his poems; also *A Fable for Critics*, given to the world anonymously—a series of witty and dashing sketches of American authors. It is full of puns and grotesque rhymes, done in a 'happy-go-lucky' style, but is not ill-natured, and has a basis of good sense. After all these years it is seen that his judgments of men and tendencies were almost prophetic.

In 1851 he visited Europe with his wife, then in delicate health, and returned in 1852. Her death occurred early in 1853. In 1857 he was married in Portland, Maine, to Miss Frances Dunlap, who died in London in February 1885.

In 1855 he was appointed professor of Modern Languages and Literature in Harvard College, to succeed Longfellow, and thereupon went to Europe to prosecute his studies. While still holding this chair, and delivering lectures which were memorable, he edited the *Atlantic Monthly*, beginning in 1857, and afterwards, along with Charles E. Norton, the *North American Review*, from 1863 to 1867. *Commencement Ode*, a notable poem, was written in 1865 in honour of the alumni who had fallen in the war of the rebellion. *The Cathedral* (1870), a poem marked by profound thought, but lightened by some playful passages, was suggested by a visit to Chartres. Three patriotic odes were written (1875-76), one for the anniversary of the battle of Concord, one for the Washington Elm in Cambridge, the other for the centennial of the Fourth of July.

His prose writings—*My Study Windows* and *Among my Books*—have high qualities, and are likely to be enduring. Some of the essays, such as those upon Chaucer, Dante, Shakespeare, and Dryden, are masterpieces of literary art. The sentences are animated, not so much with crackling epigrams as with airiness; they are (perhaps

too frequently) studded with recondite allusions, and are often lustrous with poetic images. It is always evident that it is a poet who writes. To the author's friends the most delightful of his prose works is *Fireside Travels*, containing his recollections of *Cambridge Thirty Years Ago*.

The second series of *Biglow Papers* appeared during the civil war, in which the poet's three nephews and other near relatives gave their lives for the Union. This volume is naturally graver and upon a higher plane of thought and sentiment. Certain passages (probably the best he has written) show an intensity of feeling rare in human experience; in others the scenery and the seasons are painted with loving touches; and the rude dialect, so far from being a blemish, lends an indefinable charm to the tenderness and to the descriptive art.

Lowell was an ardent abolitionist, and from the first gave himself unreservedly to the cause of freedom. In this, as in all things, he showed himself an heir of Puritan blood, faithful to the right, without regard to popularity. In such poems as *The Present Crisis* he came to his countrymen with a 'burden' like a Hebrew prophet.

He was appointed in 1877 minister of the United States to the court of Madrid, and was transferred in 1880 to that of St James, where he remained until 1885. One of his volumes, *Democracy* (1886), contains some of the brilliant addresses he made while in England, and one volume, *Heartsease and Rue* (1888), embraces later poems, including a few written long before for the *Atlantic Monthly*.

The post of minister to Great Britain is the highest in the gift of an American president, and that Lowell should have been sent to represent his country in the old home of the race sufficiently shows the estimation in which he was held, for he had never been a politician. He wrote a life of Hawthorne in the 'American Men of Letters' series (1890); *The Old English Dramatists* appeared posthumously in 1893. He lived at Elmwood (in Cambridge), the house in which he was born; and there he died 12th August 1891. His *Collected Writings* were published in 10 volumes (1890-91). See *The Poet and the Man*, by the present writer (1893), and Dr E. E. Hale's *Lowell and his Friends* (1899).

Lowell Institute, at Boston, Mass., founded by John Lowell (1799-1836), a Boston merchant. See **LECTURES**.

Lower Empire. See **BYZANTINE EMPIRE**.

Lowestoft, a municipal borough and seaport on the Suffolk coast, 118 miles N.E. of London by rail, and 49 from Ipswich, has of late years rapidly grown in favour as a watering-place, its healthfulness and the picturesqueness of its neighbourhood, combined with its easy means of access to the Broads (q.v.), all tending to its popularity. The older part of the town, which lies to the north, is built on a cliff facing the sea, on its summit being a lighthouse (1874) 123 feet above the sea-level, whilst at its base, on the Ness—the most easterly point of land in England—stands another lighthouse (1806). The modern part of the town, which has a fine esplanade 800 yards long, extends southwards into the parish of Kirkley, and is separated from the old town by the harbour, formed partly by two piers extending seawards 1300 feet, and partly by Lake Lothing, a piece of water stretching inland two miles; adjoining the harbour is a dock (1883) with a depth of water at low tide of 13½ feet, and extensive fish markets (1865-83), the property of the Great Eastern Railway, who in 1887 conveyed inland from the port 26,935 tons of fish, principally herrings, mackerel, and soles. On the new South Pier is a splendid pavilion, opened in 1890. Other features of interest in the town include the parish church (of which Whiston, the mathe-

mation, and Potter, the translator of Greek plays, were former vicars), 183 feet in length, and surmounted by a tower and spire 120 feet high, dating from the first half of the 14th century; town hall (1857), noticeable for its stained-glass windows; hospital (1882), with accommodation for thirty in-patients; and Bellevue Park (1874), not far from which was found the clay formerly used in making Lowestoft china. The principal incidents in the history of the town have been visitations of the plague in 1349, 1547, 1579, and 1603, on the last occasion the disorder raging with such fury that 280 persons died within five months and 316 in the year; its occupation in 1613 by Cromwell, who entered the town at the head of 1000 troopers, and, seizing several royalists, sent them prisoners to Cambridge; its partial destruction by fire in 1644; a great naval engagement, which took place off the coast on the 3d June 1665, when the Dutch were defeated with loss of eighteen ships; and the landing of George II. on his return from Hanover, 14th June 1736. Pop., including that of Kirkley, (1801) 2509; (1841) 5304; (1891) 19,150. See works by Gillingwater (1790) and Nall (1866).

Low German. See GERMANY, Vol. V, p. 186.

Low Latin, a term often applied loosely to the Latin spoken and written after the fall of the Roman empire, as well as during the middle ages. The process of deterioration from classical models had already begun even in the time of Cicero, but it rapidly grew until were formed gradually in different divisions of the dismembered empire those distinct varieties out of which grew the modern Romance tongues. See ROMANCE LANGUAGES.

Lowndes, WILLIAM THOMAS, a London bookseller (died 1843) to whom we are indebted for *The Bibliographer's Manual of English Literature* (4 vols. 1834; see BIBLIOGRAPHY) and *The British Librarian* (1839).

Low Sunday, in the Roman Catholic Church, is the first Sunday after Easter. It is so called in contrast to the great festival whose octave it ends. In France and Germany it is usually called *Quasimodo*, from the first word of the introit (1 Peter, ii. 2) in the Mass.

Lowth, ROBERT, a learned English bishop, was born November 27, 1710, at Winchester; his father was rector of Buriton. He was educated at Winchester, whence, with a reputation both as a scholar and poet, he passed to New College, Oxford, in 1730. In 1741 he was appointed professor of Poetry, and hence arose his famous *De Sacra Poesi Hebræorum Prælectiones Academicæ*, published in 1753. In 1750 Bishop Hoadley conferred on him the archdeaconry of Winchester, and in 1753 the rectory of East Woodhay in Hampshire. Lowth became D.D. of Oxford in 1754, prebendary of Durham and rector of Sedgely in 1755, a Fellow of the Royal Societies of London and Gottingen in 1763, Bishop of St Davids in 1766, of Oxford a few months after, of London in 1777, and died November 3, 1787. Besides his lectures, his two principal works are *Life of William of Wykeham* (1758) and *Isaiah, a new Translation* (1778). Lowth's *Prælectiones* was one of the first books that treated the Bible poetry as literature, and though most of his criticism, save the doctrine of poetic parallelism, is long since obsolete, he gave a new direction to the biblical criticism of Herder and later critics.

Loyola, BENATUS DE, is the name by which history knows Miguel Lopez de Recalde, the youngest son of Bertram de Loyola and Marina Salez de Behi, who was born in the year 1491 at his ancestral castle of Loyola, in the Basque province of Guipuzcoa. After the scant training of that age in letters, he was received as a page in the court of Ferdinand; but the restraint and inactivity of

court-life were distasteful to his enthusiastic mind, and under the auspices of his relative, the Duke of Najara, he embraced the profession of arms. The details of his career as a soldier display both the excellency and the irregularities of his ardent temperament, thrown undirected among the temptations as well as the duties of a military life. Of his bravery and chivalrous spirit many remarkable instances are recorded, and one of these proved the turning-point of his career. In the defence of Pampeluna he was severely wounded in both legs, one being fractured by a cannon ball, and the other injured by a splinter; and having been taken prisoner by the French, he was by them conveyed to his paternal castle of Loyola, where he was doomed to a long confinement. After an operation, the results of which had well-nigh proved fatal, he eventually recovered; and with his returning strength he appears to have resumed his habitual levity. In order to remove a deformity which had resulted from the first setting of his wounded limb, he consented to the painful remedy of having it re-broken in order to be reset. After this operation his convalescence was even more slow; and, the stock of romances by which he was wont to relieve the tedium of confinement having been exhausted, he was thrown upon the only other available reading, that of the *Lives of the Saints*. The result was the creation of a spiritual enthusiasm equally intense in degree, although in kind very different from that by which he had hitherto been drawn to feats of chivalry. The spiritual glories of St Francis or St Dominic now took, in his aspirations, the place which had been before held by the knights of mediæval romance. With souls like his there is no middle course; he threw himself, with all the fire of his temperament, upon the new aspirations which these thoughts engendered.

Renouncing the pursuit of arms, and with it all other worldly plans, he tore himself from home and friends, and resolved to prepare himself for the new course which he contemplated by a pilgrimage to Jerusalem. With a view to his immediate preparation for this holy task, he retired in the garb of a beggar to the celebrated monastery of Montserrat, where, on the vigil of the Feast of the Annunciation, in 1522, he hung up his arms, as at once a votive offering significant of his renunciation of the works of the flesh, and an emblem of his entire devotion to the spiritual warfare to which he was from that moment vowed. From Montserrat he set out barefooted on his pilgrimage, the first step of which was a voluntary engagement which he undertook to serve the poor and sick in the hospital of the neighbouring town of Manresa. There his zeal and devotion attracted such notice that he withdrew to a solitary cavern in the vicinity, where he pursued alone his course of self-prescribed austerity, until he was carried back, utterly exhausted, to the hospital in which he had before served. To this physical exhaustion succeeded a state of mental depression, amounting almost to despair, from which, however, he arose with spiritual powers renewed and invigorated by the very struggle. From Manresa he repaired by Barcelona to Rome, whence, after receiving the papal benediction from Adrian VI., he proceeded on foot, and as a mendicant, to Venice, and there embarked for Cyprus and the Holy Land. He would gladly have remained at Jerusalem, and devoted himself to the propagation of the gospel among the infidels; but finding no encouragement, returned to Venice and Barcelona in 1524.

Taught by his first failure, he now resolved to prepare himself by study for the work of religious teaching, and with this view was not ashamed to return, at the age of thirty-three, to the study of

the very rudiments of grammar. He followed up these elementary studies by a further course, first at the new university of Alcalá, and afterwards at Salamanca. In both places he incurred the censure of the authorities by some unauthorised attempts at religious teaching in public, and eventually he was induced to repair to Paris for the completion of the studies thus repeatedly interrupted. Here, again, he continued persistently to struggle on without any resources but those which he drew from the charity of the faithful; and here, again, he returned to the same humble elementary studies. It was while engaged in these studies that he first formed the pious fraternity which resulted in that great organisation which has exercised such influence upon the religious, moral, and social condition of the modern world. From the close of his residence in Paris Loyola's history has been told in the history of his order (see JESUITS). From the date of his election as the first general of his society he continued to reside in Rome. To him are due, not alone in the general spirit, but even in most of their details, all its rules and constitutions; from him also originated several works of general charity and benevolence, the germs of great institutions still maintained in Rome. But the great source of his influence upon the spiritual interests of the world is his well-known *Ecclesiastical Spirituality*, of which an account has been already given. He died at Rome, prematurely, worn out by his long austerities, July 31, 1556. He was beatified in 1609, and canonised in 1622.

His life has been written in almost every European language. The biographies of Ribadaneira (1572), Maffei (1585), Bonhours (1679), Daurignac (1865), Denis (1885), are well known; and there are books by Stewart Rose (1891), Father Hughes (1892), Gothein (Halle, 1896), and H. Joly (trans. 1899).

Loyson. See HYACINTHE.

Lozère, a department in the south of France, derives its name from Mont Lozère, one of the summits of the Cévennes (q.v.). It comprises the arrondissements of Mende, Florac, and Marvejols. Area, 1996 sq. m.; pop. (1872) 135,190; (1891) 135,527. Capital, Mende. The department forms the south-east extremity of the central uplands of France, and embraces the highest peaks of the Cévennes (Pic de Finiels, 5584 feet). These mountains are the birthplace of numerous rivers, which go down to feed the Rhone, the Garonne, and the Loire. In the mountains the climate is severe, and little grain is produced. Potatoes, chestnuts, fruits, hemp, and flax are the more important products, and silkworms are bred. The department contains some of the grandest scenery of France in the eroded limestone districts of the 'Causse.'

See Martel's *Les Cévennes* (1890), and Betham-Edwards, *The Roof of France* (1889).

Luang Prabang, a Shan state on the Upper Mekhong, ceded to France by Siam, with other territory, in 1893. See SHANS.

Lubbock, SIR JOHN, BARON AVEBURY (erc. 1900), son of the astronomer and mathematician, Sir J. W. Lubbock (1803-65), was born in London, April 30, 1834, and educated at a private school and at Eton. At fourteen he entered his father's banking-house, and in 1856 became a partner. He was chosen honorary secretary to the Association of London Bankers, first president of the Institute of Bankers, and served in the International Coinage Commission, as a member of the Public School Commission, the Advancement of Science Commission, the Education Commission, and the Gold and Silver Commission. In 1865 and 1868 he contested West Kent unsuccessfully in the Liberal interest, but was returned for Maidstone in 1870; and on losing his seat in 1880 he was returned

for London University—since 1886 as a Liberal Unionist. As a politician he has devoted himself chiefly to financial and educational subjects, and has succeeded in passing more than a dozen important public measures, including the Bank Holidays Act (1871), the Bills of Exchange Bill, which regulates the whole law relating to cheques, bills, and promissory notes, the Ancient Monuments Bill (1882), and the Shop Hours Bill (1889). He is an honorary graduate of Oxford, Cambridge, Edinburgh, Dublin, and Würzburg; was vice-chancellor of the university of London from 1872 to 1880; is a trustee of the British Museum; and has acted as president of many of the scientific societies, being president of the British Association in 1881. President of the London Chamber of Commerce, and chairman of the London County Council, he is best known as a man of science for his researches on the ancient vestiges and remains of man, and on the habits of insects, especially bees and ants.

Besides more than a hundred memoirs to various societies, he has published *Prehistoric Times, as illustrated by Ancient Remains and the Manners and Customs of Modern Savages* (1865); *The Origin of Civilisation and the Primitive Condition of Man* (1870); *The Origin and Metamorphoses of Insects* (1874); *On British Wild-flowers, considered in Relation to Insects* (1875); *Addresses, Political and Educational* (1879); *Scientific Lectures* (1879); *Monograph of the Thysanura and Collembola: Fifty Years of Science*, an inaugural address to the British Association (1881); *Ants, Bees, and Wasps* (1882); *Flowers, Fruits, and Leaves: On Representation: The Senses and Instincts of Animals* (1888); and *The Pleasures of Life* (1887; 20th ed. 1890; 2d series, 1889); *The Beauties of Nature* (1892); *The Use of Life* (1894); and an interesting work on *The Scenery of Switzerland* (1896).

Lübeck, a free city of Germany, and great port on the river Trave, 12 miles from the Baltic, and 40 by rail N.E. of Hamburg. It was founded by Saxons in 1143, in place of a former Wendish town of the same name, lower down the Trave. The foundations of its prosperity were laid by Henry the Lion, Duke of Saxony, who gave it a charter, and took unusual pains to encourage its budding commerce. He also built a cathedral, and transferred the see of Oldenburg to Lübeck. Frederick Barbarossa not only confirmed, but greatly enlarged, its privileges, and Frederick II. made it a free city of the empire. From this time it made rapid progress as a trading centre: it was from the first one of the most influential members of the Hanseatic League (q.v.), and eventually its head. The city became in short the commercial metropolis of the Baltic and northern Europe. This proud position was due in some measure to the liberal encouragement of several successive emperors, but in still greater measure to the prudent guidance of the oligarchical council, composed of men elected from the families of the great merchants. The decay of Lübeck was necessarily involved in the decay of the Hanseatic cities generally. The eventful dictatorship of Wullenwever (1533-37) was the last dying effort of the League. Full administrative rights were not conferred upon the burghers or citizens until 1818. At the present time the constitution, embracing a senate (14 members) and a representative assembly (120 members), is thoroughly democratic in spirit. The French held Lübeck from 1806, when they captured it and plundered it—except for nine months in 1813—down to the treaty of Vienna, which made it a free town of the German Confederation. The traditional connection with Hamburg and Bremen, the last survivors of the Hanseatic League, was kept up till 1879. Nevertheless, in 1866 Lübeck joined the North German Confederation, and in 1868 the Customs Union (*Zollverein*).

The free city possesses 115 sq. m. of territory,

including the port of Travemünde, near the mouth of the river. The total population was 76,485 in 1890, of whom 63,590 were in the city of Lübeck (44,799 in 1875). The industries are more varied than important, the chief being the manufacture of cigars and vinegar, brewing, brandy distilling, soap-boiling, and iron-founding. Lübeck is the great centre for trade between Hamburg and the cities of Germany on the one side and the countries that border the Baltic on the other. The imports reach an annual value of about 93 millions, and the exports of 8 millions. This traffic is mostly transit business: for instance, corn, timber, spirits, linseed, paper, tar, and butter are brought from Russia; timber, iron, steel, and copper from Sweden; butter and corn from Denmark and Finland; wines and spirits from France; coals (45,000 tons), grinding and other stones, and iron wares from Great Britain; and petroleum from North America. The port is entered annually by an average of 2300 vessels of 443,000 tons. The Trave was deepened to 15 feet in 1878-82. A scheme for a canal to connect Lübeck with the Elbe has been postponed owing to the Kiel-Elbe Canal.

The streets of the city are mostly wide and pleasant. The city-wall was demolished in 1802 or converted into promenades. The churches include the handsome Gothic St Mary's, first erected in 1163-70, though the existing edifice dates from 1276-1310, with two towers 407 feet high, old sarcophagi, masterpieces of old German sculpture, and pictures by Overbeck and others; the cathedral, founded in 1173, and enlarged in the 14th century, with a tower 394 feet high, and an altarpiece by Menning; St James's, built before 1227, and St Peter's, before 1163, which contain fine old paintings and monuments; and St Egidius, which has an excellent organ. The town-house is the most notable amongst the secular buildings; it is built of red and black glazed bricks. The hospital of the Holy Spirit, dating from the 13th century, is adorned with admirable wood-carving. There are a school of navigation, a library of 98,000 vols., ethnographic, antiquarian, zoological, and art collections, &c. The state debt amounts to £692,380.

See Max Hofmann, *Geschichte der Freien- und Hanse-Stadt Lübeck* (1889-90); Pauli, *Lübeksche Zustände im Mittelalter* (1872); and Waitz, *Lübeck unter Wollentwürf* (3 vols. 1855-56).

Lübke, WILHELM (1826-93), author of a score of books on the history of art in Germany, France, Italy, &c., was born at Dortmund, studied at Bonn and Berlin, taught the history of art at Stuttgart and Karlsruhe, and was finally director of the art galleries of Baden.

Lublin, capital of a Polish government, stands on a sub-tributary of the Vistula, 96 miles by rail S.E. of Warsaw. It was once a great commercial city, has a 13th century cathedral, and was plundered by the Mongols. There are manufactures of tobacco, beer, candles, soap, &c., and a large trade in corn and wool. Pop. (1871) 24,456; (1891) 53,137. Here was signed in 1569 the treaty of union between Lithuania and Poland.—The *government* has an area of 6497 sq. m. and a pop. (1891) of 1,059,959.

Lubricants, unguents interposed between surfaces in machinery which work on one another, with the object of lessening the friction (q.v.), and thereby diminishing the wear and tear, and lessening the waste-power taken up in overcoming friction. Various unguents are in use: animal fats and oils, such as tallow, sperm-oil, lard, &c.; vegetable oils, as, for example, olive-oil and rape oil; and many mineral oils. The particular unguent best suited for any purpose is a matter of considerable importance. Where the pressure between the two surfaces is great it is necessary to

use oils with body or thickness, since the lighter oils are readily squeezed out from position. Sperm-oil, for instance, is a very good lubricant, but not so satisfactory for heavy loads and high temperatures. Many oils again, especially vegetable oils, deteriorate much faster in use than others by evaporation of their volatile constituents.

Luca della Robbia. See ROBBIA.

Lucan, GEORGE CHARLES BINGHAM, EARL OF, British general, was born on 16th April 1800, and succeeded his father, the second earl, in the title in 1839. He was put to school at Westminster, and on leaving entered the army. He accompanied the Russian troops under General Diebitsch as a volunteer against the Turks in 1828. As commander of a division of cavalry in the Crimea he fought at the Alma, Balaklava, and Inkermann (see CRIMEAN WAR). Appointed lieutenant-general in 1858 and G.C.B. in 1869, he became field-marshal in 1887. He died 10th November 1888.

Lucania, a province of ancient Italy, south-east of Calabria, and bordering on the Gulf of Tarentum. It was inhabited by an Oscan people, and corresponds nearly to the present province of Potenza and part of Salerno.

Lucanus, M. ANNEUS (39-65 A.D.), whose *Pharsalia* heads the epic poems of the silver age, was born at Corduba, capital of the province Bœtica, the centre of Roman influence in Spain, and of a literary school which lasted on into mediæval times. Among the leading Corduban families were the Annæi, of whom Annæus Seneca, the rhetorician, had three sons—M. Annæus Seneca, the Gallio of the Acts of the Apostles; L. Annæus Seneca, the philosopher; and M. Annæus Mela, who married Acilia, daughter of Acilius Lucanus, a noted orator of the place, and by her became father of M. Annæus, who received the cognomen Lucanus from his maternal grandsire. Rome's irresistible attraction for the outlying world had already drawn thither Seneca, the philosopher; and Mela, with his wife, followed, to place their son, an infant prodigy, under his uncle's eye for the usual training in rhetoric and moral science. Young Lucan took kindly to the hereditary culture, and under Palamon the grammarian, and Cornutus the Stoic, of whom Persius the satirist was also an admiring pupil, he became proficient in the merits which won the applause of the lecture-room. Indeed, his aptitude for prose and verse was ominous of the fatal fluency which evolved the first three books of the *Pharsalia* while yet in his teens. Hatred of tyranny was the prevailing note of the patricians, and Lucan shared the hopes of his order as to Nero's government, not inauspiciously begun. But the imperial pupil of Seneca ere long betrayed the lower side of his character; and a morbid vanity, courting the applause of the circus and the theatre, made him the rival of charioteers and poets, and, among these, of Lucan. At first the young emperor and the young poet were friends, and Nero's favour had conferred on the latter the quaestorship, with which he entered the curia as well as the augural priesthood. But imperial vanity 'bears no brother near the throne,' and Nero's self-love was mortally wounded when, in a great public contest, the palm went over his head to Lucan. The emperor's marked discourtesies were returned by his successful rival with satire and with redoubled efforts to outshine him, till Nero was stung into forbidding Lucan either to publish poems or to recite them. About that time the Pisonian conspiracy had been hatching, and the emperor's increasing follies and barbarities hastened its development. Lucan became one of its ringleaders, and with characteristic impetuosity was already discounting its success, when the news

came to him that it was discovered and he himself betrayed. At first his demeanour was worthy of a Stoic; then his courage declined, till it sank so low that—quite falsely, it is believed—he accused his own mother Aelia of being privy to the plot, in hopes that the matricidal emperor might be conciliated by a similar crime! But in vain. He was ordered to die, and, having had his veins opened, he bled to death in the bath, reciting an appropriate passage from one of his poems.

Except a few fragments, we now have nothing of Lucian's many writings but the *Pharsalia* in ten books, recounting the mighty duel of Pompey and Cæsar Julius for the empire of the world. Though always freely criticised, its acceptance in antiquity and in modern times has been great. From Tacitus to Sealiger and Macaulay it has found praise and censure in pretty even proportion. Its defects are mainly those of youth—inspired youth trained in a school where epigram and antithesis were sought after as the chief merit of style. It is frequently bombastic, sometimes obscure; so unsteady, moreover, in its delineation that it is open to doubt whether its hero is not Cæsar Julius after all, rather than the Pompey who is characterised as 'Magnus' throughout. When at its best its merits are those of eloquence rather than poetry; and for its many brilliant and apt 'sententia' it justly enjoys an 'immortality of quotation.' Its Roman patriotism strikes so true a note that with all pioneers of liberty it has been a favourite—particularly in the England of the 17th century. Indeed, the historian of the Long Parliament, Thomas May, not only wrote a respectable translation of it, but also a still more respectable continuation in the language and verse of the original. Rowe's translation, considered by Johnson to be one of the best in the English language.

There are other English translations in verse by Marlowe (Bk. i.), Sir Ferdinand Gorges, and E. Ridley (1897); and in prose by H. T. Riley (1853). There are editions by Oskindorp, Barnann, Haskins (1887), Hosius (Teubner, 1893), and Francken (1895-98).

Lucaris, CYRIL, a Greek theologian, was born in Crete in 1572, studied at Venice and Padua, and subsequently in Geneva, where he became imbued with the Calvinist doctrines. Taking holy orders, he rose by 1621 to the highest dignity in the Greek Church, Patriarch of Constantinople. An outline of his public career will be found under GREEK CHURCH (Vol. V. p. 397). In June 1637 he was seized in Constantinople, hurried on board a vessel, and it was never properly ascertained what became of him. According to some he was strangled in the ship which bore him off; according to others, he suffered this fate in a castle on the shores of the Black Sea. His doctrines have been repeatedly condemned by Greek synods.

Lucarne, a Dormer Window (q.v.), especially in a church spire.

Lucas van Leyden, whose proper name was Lucas JACOBSZ, Dutch painter and engraver, was born in Leyden in 1494. An extremely precocious artist, he painted a picture of St Hubert when only twelve, and the celebrated print, 'Mahomet and the Monk Sergius,' was engraved when he was only fourteen. But he was not enrolled in the guild of St Luke at Antwerp in 1522. He practised successfully almost every branch of painting, and as an engraver ranks as the equal of Albert Dürer in everything except fertility of design. His range of subjects was very wide, and embraced events in sacred history, incidents illustrative of the manners of his own period, and portraits. He was on terms of intimacy with Mabuse, and held friendly intercourse with Dürer, whose talents he admired without professional

jealousy. He died in 1533, having been confined to bed for six years. Amongst his most celebrated pieces are the 'Hill of Calvary,' by some regarded as his masterpiece, 'Adam and Eve expelled from Paradise,' 'Ecce Homo,' 'A Girl and a Dog,' the 'Card Party,' 'St Jerome,' and 'Christ healing a Blind Man.'

Lucca, chief town of an Italian province, is situated in a plain, bounded by picturesque hills and irrigated by the Serchio, 14 miles by rail N.E. of Pisa. Pop. (1894) 77,300. 'Lucca the Industrious' has a great trade in olive oil and silk, the latter manufacture introduced in the end of the 11th century. The cathedral of St Martin, begun in 1063, has a cedar crucifix reputed to have been brought to Lucca in 782; this Volto Santo ('Sacred Countenance') is mentioned by Dante. The church also contains several fine paintings, the tomb of Maria Guinigi (cf. Ruskin's *Modern Painters*, vol. ii.), and valuable archives. There are nearly forty other churches, some dating from the 7th and 8th centuries. A splendid aqueduct (1820) supplies the town with water from the Pisan hills. The municipal buildings (1578) contain a valuable collection of paintings. Lucca is exceptionally rich in artistic and scientific institutions. The city was a bishopric as early as 347, and in 1726 was made an archbishopric. The environs abound in delightful villas. In a charming valley, 16 miles N. of the town, are situated the mineral baths of Lucca, which have been famous since the 15th century. Their temperature varies from 96° to 136° F.—The province, which has an area of 558 sq. m. and a pop. (1895) of 289,890, is famed for the fertility of its soil and the superiority of its agriculture. The Lucchesi are a frugal, shrewd race; numbers leave home in search of employment, and they form a large proportion of the itinerant figure-vendors, organ-grinders, and stucco-workers of Europe.

Lucca (anc. *Luccæ*) was made a Roman colony in 177 B.C. It was erected into a duchy by the Lombards, and its merchants traded in English wool from the 9th, but more especially from the 12th century. The town had a most chequered history down to 1369, when it became an independent republic, which lasted till 1797. In 1805 it was erected into a principality by Napoleon for his sister Elisa Bacciochi, and in 1815 passed to Maria Louisa of Spain, queen of Etruria. Her son, Charles Louis, ceded it to Tuscany in 1847, on obtaining possession of Parma and Piacenza.

Lucena, a town of Spain, 36 miles S. by E. of Cordova, is famous for its wine and breed of horses. Pop. 21,271.

Lucera (the ancient *Luceria* of the Samnite war), a town of Southern Italy, 12 miles by rail N.W. of Foggia, has a cathedral dating from 1302, and a famous ruined castle of Frederick II., who died, however, at the neighbouring castle of Fiorentino. Pop. 14,067.

Lucerne (*Medicago sativa*), a species of Medick (q.v.), one of the most valuable of the leguminous plants grown for the supply of green food to cattle. It is a native of the south of Europe, and has been cultivated there from an unknown antiquity. It is not very largely grown in Britain, but in some places very successfully, chiefly in the drier parts of the south of England. The climate of many districts of Scotland is not too cold for it. It is largely cultivated in some parts of North and South America. It endures great droughts, its roots penetrating very deep into the ground. Sir John Bennet Lawes states that at Rothamsted he has found it the best of all forage-crops for a drought. It delights in a rich and calcareous soil, and never succeeds on damp soils or tenacious clays. It is a

perennial, and if kept free from weeds affords good crops for six, seven, or more years. It is sown in rows, at 10 or 14 inches apart, and may be mown several times in a year, growing very quickly after being mown. The quantity of produce is very great—sometimes from 20 to 30 tons per annum—and few other forage-plants are ready for use so early in spring. Lucerne has a rather erect stem, leaves with three obovate-oblong toothed leaflets; purplish-blue or sometimes yellow flowers in many-flowered racemes, and pods twisted two or three times round. It ought to be mown before it comes into flower, as it then becomes fibrous and less nutritious. In Spanish lands it is called *Alfalfa*.

Lucerne (Ger. *Lucern*), the capital of a Swiss canton, 59 miles SE. of Basel, 147 SSE. of Strasbourg, and 177 NNW. of Milan. It is very beautifully situated at the point where the Reuss issues from the north-west extremity of the Lake of Lucerne, and is partly surrounded (on the north) with medieval towers. Near the lake, rising from the middle of the Reuss, is an old tower, which is said to have been a lighthouse (*Lucerna*) in Roman times, whence the name of the town. Outside one of the gates is the Lion of Lucerne, hewn (1821) out of the solid rock after a model by Thorwaldsen, a monument to the Swiss guard who perished at the Tuileries in 1792. Near by is the Glacier Garden, with rocks illustrating the action of ice. The town is a busy centre for tourists and summer visitors to Switzerland. Pop. (1894) 21,778.—The canton has an area of 579 sq. m. and a pop. (1894) of 135,813. The soil is fruitful in the valleys; in the more mountainous parts the rearing of cattle is carried on to a great extent, large quantities of cheese being made. The highest elevation in this canton is 6998 feet, a peak of Mount Pilatus. The inhabitants are mostly of German race and language, and belong to the Roman Catholic Church, except about 5650 Protestants, to whom the free exercise of their religion was first accorded in 1828. The canton threw off the yoke of Austria in 1332, and, joining Schwyz, Uri, and Unterwalden, formed the nucleus of the future Swiss Confederation. The constitution of Lucerne is a representative democracy. The legislative body is the Great Council, one member being elected by every 1000 citizens; the executive is vested in seven members, who are not of the council. See SWITZERLAND.

THE LAKE OF LUCERNE, called also *Vierwaldstattersee* ('Lake of the Four Forest Cantons'—Uri, Unterwalden, Schwyz, and Lucerne), is one of the most beautiful sheets of water in Europe. In shape it resembles roughly a cross with a crumpled stem; its shores are mostly steep and rocky. Length from Lucerne to Flüelen, 23 miles; average breadth, about $\frac{1}{2}$ mile; area, 44 sq. m. The chief places on its banks are Lucerne, Küssnacht, and Alpnach at the north-west, and Flüelen near its south-west extremity. It forms part of the St Gothard route, and is navigated by steamboats, but is liable to sudden and violent storms. The lake is rich in associations of William Tell (q.v.) and his story.

Lucian, one of the most interesting, graceful, and amusing of Greek writers, was born in Samosata, the principal town of Commagene in Syria, probably about 125 A.D. Intended by his parents to be a sculptor, Lucian early asserted his own decided preference for letters. Having learned Greek and studied under some teacher of rhetoric, he practised as an advocate for a short time in Antioch. He then turned to the composition of show speeches (epideictic oratory) and to reciting them as a means of making a living. His professional career thus made him a travelling artist; and in the quest for suitable festivals at which to deliver his declamations he travelled through Asia

Minor, Greece, Macedonia, Italy, and Gaul. Having thus made a fortune and a name, he settled in Athens, still the intellectual capital of the world, and there devoted himself to the study of philosophy. There, too, he produced a form of literature hitherto, as he claims, unknown. This was humorous dialogue. In his old age he reverted to his first love, recitation. He accepted a good appointment in Egypt, where at an advanced age, eighty or ninety years, he died. A Semite by race but not by education, a subject of Rome but not a Roman, a writer of Greek but not a Greek by birth, Lucian was by circumstances singularly freed from every tie, prepossession, or prejudice which might have stood at all in the way of his deriving the largest possible amount of amusement out of the world. Nor was this all that fortune did for him; she brought him into the world at an age when the old faiths, the old philosophy, the old literature, were all rapidly dissolving in decay, and when what the new would be was an insoluble problem. For satire, whose nature is simply to deny, never was there a fairer field; and Lucian revelled in it. The old faith was gone, and the inherent absurdity of retaining the old deities without the old belief is brought out by Lucian in the *Dialogues of the Gods*, *Dialogues of the Dead*, *Prometheus*, *Chiron*, *Mentippus*, *Leucanippus*, and others. Whether the old philosophy was the more disgraced by the shallowness or the vices of those who professed it in Lucian's time it would be hard to tell from his *Symposium*, *Halius*, *Bion Praxias*, *Drupetr*, &c. The old literature had been displaced by novels or romances of adventure of the most fantastic kind, which Lucian parodies in his *True Histories*. In fine, there is no department of life with which he is unacquainted or from which he fails to raise a laugh. His extensive travels gave him abundant material, and his extensive reading gave him ancient instances to confirm and illustrate his own experiences. His Greek, though not absolutely pure Attic of the best times, is but little removed from it; and this is to be accounted for by the fact that he learned Greek as a foreign language, and consequently picked it up from Plato and not from the streets. Apart from the purity of his Greek, his style is perfectly delightful, simple, pellucid, and sparkling. The *editio princeps* is dated 1496, Florence. The editions by Hemsterhuis and Reitz (*eum versione Latina et notis rariorum*, 1730-45) and by Lehmann (1822-29, in 9 vols.) have not yet been superseded. See works by Croiset and Sommerbrodt (1888), and *Lucian, the Syrian Satirist*, by Lieut.-col. Hine (1900).

Lucifer (Lat., 'light-bringer'), the morning-star; see PLANETS. The church fathers attached this name to Satan in the belief that Isaiah, xiv. 12, which refers to the king of Babylon, contained a reference to the Prince of Darkness; cf. Luke, x. 18.

Lucifer Matches. See MATCHES.

Lucigen, one of the most powerful artificial lamps, and specially well adapted for lighting large spaces, whether open or covered. The light, which is produced by burning creosote oil, is brilliant and diffused, and does not cast black shadows like the electric light, as the flame gives a broad glow resembling very much the effect of the sun. The construction of the lamp is exceedingly simple. The tank or oil-reservoir is a plain circular drum, to the top of which the burner is fixed. The burner-tube, E, extends to the bottom of the drum, passing through an outer tube F, which is pierced with holes through which the oil is strained, and passes down into the small well, L, in the bottom of the tank. The compressed air enters the drum at H, and forces the oil up the tube, E, to the oil cone I.

The heated air from the coil, C, enters the annular space between the oil-cone and burner, where the air and oil become amalgamated and escape in the form of a spray or vapour which is immediately inflammable. There are various forms of the

Section of a Lucigen Lamp:

A, air supply; B, stopcock for controlling supply of air to burner; B', stopcock for controlling oil-feed; C, coil for heating air; D, burner; E, burner-tube; F, strainer-tube; G, drip-cock for condensed moisture; H, air to drum; I, oil-cone; J, for oil supply; L, oil well.

Lucigen, which was first used in 1885; but for a universal lamp the vertical type worked by compressed air may be taken as the best, which, with about 18 lb. pressure at the burner, gives the most regular and effective light.

Lucilius, Roman poet, the creator of that form of poetic satire which was wielded so brilliantly by his successors, Horace, Persius, and Juvenal. He was born at Suessa Aurunca, in Campania, probably in 164 or 166 B.C. Other dates given or suggested are 148 and 180. He was on intimate terms with the Younger Scipio, under whom he is said to have served at Numantia, and of Lucilius. He was a thorough man of the world, and wrote in a bold, independent tone, choosing for his subjects contemporary events, persons, affectations, vices, &c. He enjoyed great popularity during his lifetime, so much so that at his death in 102, at Naples, he was honoured with a public funeral, although he had never held any public office. He wrote thirty books of *Satires*, of which nothing but fragments remain, preserved in great part by the grammarians. The best editions of these fragments are Lachmann's (Berlin, 1876) and L. Muller's (Leip. 1872), who also wrote *Leben und Werke des Lucilius* (1876).

Lucina ('the light-bringing'), a name applied both to Diana and to Juno; to the latter, Juno Lucina, as the especial divinity that presides over childbirth, corresponding to the Ilithyia of Greek mythology. See *JUNO*.

Lücke, GOTTFRIED CHRISTIAN FRIEDRICH, Protestant theologian, was born 21st August 1791, at Egeln, near Magdeburg, and was professor of Theology at Bonn (1818-29), and at Göttingen, where he died 14th February 1855. His great work is his commentary on John (1820-25; 3d ed. 1850-56); other works are on the Apocalypse (2d ed. 1818-52), and on New Testament Hermeneutics (1817).

Luckenwalde, a town of Prussia, 31 miles by rail SSW. of Berlin, has cloth and hat manufactures. Pop. 18,398.

Lucknow (*Laknau*), capital of the province of Oudh, and the fourth largest city in India, stands on the river Guntli, by rail 42 miles NE. of Cawnpore and 199 NW. of Benares. The city is interesting, not only as the capital of the former kingdom of Oudh, and for the memorable part it played in the Mutiny, but also as a centre of modern Indian life, a chief school of native music and poetry and of Mohammedan theology. The appearance of magnificence and splendour which the city presents when seen from the outside is not borne out by close internal inspection, though a vast improvement has been effected since the Mutiny. The chief architectural glory of the place is the Imambara or mausoleum of Asaf-ud-Daula, the fourth Nawab, who did so much to embellish Lucknow with magnificent buildings. This edifice, built in 1784, stands within the Machi Bhawan fort (built by Asaf's predecessor), and is now converted into a British arsenal. The Rumi Dorwaiza, a grand and massive gateway, leading out of the fort, the magnificent Residency palace, and the country palace of Bibiâpur, besides numerous minor buildings, were all erected by the same prince. The Jama Masjid or chief mosque, and the huge palaces of Chattar Manzil, Kaisar Bagh, Farhat Baksh, four royal tombs, and an observatory (head-quarters of the rebels during the Mutiny) are the most noteworthy amongst the remaining public buildings, though the palaces are remarkable for little else except their great size, debased style of architecture, and gaudy decorations. The educational establishments embrace Canning College, established in 1864, now with five departments; the Martinière College, where 120 soldiers' and civilians' sons are educated; and more than two dozen mission and other schools. The staple of the native industries is gold and silver brocade, besides which there are—muslins and other light fabrics, embroidery in gold thread and silk upon cotton and velvet, glass, clay-moulding, shawls, jewellery (but declining), and paper. There are here extensive railway workshops. Lucknow is a busy commercial town, trading chiefly in country products (grain, butter, sugar, molasses, spices, tobacco, oil-seeds), European piece-goods, salt, leather, &c. Pop. (1869) 284,779; (1881) 261,303; (1891) 273,028, of whom 20,000 were in the cantonments just outside the city; and in religion 160,000 were Shi'ite Mussulmans and the rest mainly Hindus.

The site of the present fort was originally occupied by a small village called Lakshmanpur, founded by a brother of Rama Chandra, the hero of the epic *Ramayana*. The city did not, however, rise into importance until it was made (1732) the capital of the independent state of Oudh (q.v.). Lucknow covered itself with glory by the stirring events of which it was the scene during the mutiny of 1857, and which have been enshrined in splendid verse by Tennyson. The insurrection broke out on the night of 30th May. Sir Henry Lawrence had already fortified the Residency and garrisoned it with 750 British troops. An attempt to check the advance of the enemy at a place 8 miles from the city was defeated on 29th June, and two days later the British were besieged. On 4th July Sir Henry Lawrence died, from a wound caused on the 2d by a bursting shell. Three times in succession the little garrison, commanded on the first occasion by Major Banks, on the last two by Brigadier Inglis, beat back the assaults of the enemy. On 22d September Havelock (q.v.) and Outram, with a relieving force, captured the Ahm-bagh (q.v.), and on the 26th reached the Residency. Again the siege was formed by the rebels, both of the

Residency and the Alma-bagh. The latter was succoured by Sir Colin Campbell on 10th November. Then, after driving the mutineers out of their two principal strongholds, Sir Colin reached the garrison in the city (16th November). Six days later the gallant Havelock died of dysentery. Sir Colin Campbell, leaving Ontram with 3500 men to hold the Alma-bagh till his return, escorted the civilians, and the ladies and children, to Cawnpore. In the first week of March 1858 he returned to the attack upon the rebels at Lucknow, who had meanwhile entrenched themselves in the city. It cost a week's hard fighting to subdue them (9-15th March): the issue ended the mutiny.

There are recent books on the mutiny and siege by Lady Inglis, *The Siege of Lucknow* (1892); Forbes Mitchell, *The Great Mutiny* (1895); and M'Leod Innes, *Lucknow and Oude in the Mutiny* (1895).

Luçon, an episcopal town of 6301 inhabitants in the south of La Vendée, on the railway from Nantes to Bordeaux, and on the canal of Luçon. Richelieu was Bishop of Luçon; and many battles were fought here in 1792-97.

Lucretia, the wife of L. Tarquinius Collatinus, famous for her heroic virtue. She was shamefully outraged by Sextus Tarquinius, whereupon she summoned her husband and a group of friends, and, after making them take a solemn oath to drive out the hated race of Tarquins from the city, plunged a knife into her heart. Of the poetic elaborations of the story the most famous is the long *Rape of Lucrece* of Shakespeare's youth. See BRUTUS.

Lucretius, TITUS CARRUS, Roman poet, lived in the first half of the 1st century B.C., but of the particulars of his life we really know nothing. A story was current some time after his death that he died raving mad from the effects of a love-potion administered to him by his wife Lucilia, and on this story Tennyson has founded a very striking and powerful poem; but it would seem to have been a malicious invention, started by some hostile critic, or possibly by an early Christian writer who took delight in assuming that a champion of unbelief and materialism must have come to a bad end. The great—indeed, the only—work of Lucretius is an essay in hexameter verse, 'On the Nature of Things' (*De Rerum Natura*), in six books, containing upwards of 7400 lines. The work was said, but on no good authority, to have been revised by Cicero. All we know is that Cicero once briefly alludes to it (*Epist. ad Quintum Fratrem*, ii. 9), observing that there are several flashes of genius in the poem, and that much skill is shown in the composition. This is a very fair criticism, and it has commended itself to general acceptance. The poem, we take it, was on the whole coldly received by Roman readers, and with the moderns Lucretius has never been a popular classic. The subject-matter of his work is not generally attractive, nor is the versification for the most part pleasing or harmonious. Lucretius aspired to popularise the philosophical theories of Democritus and Epicurus on the origin of the universe, with the special purpose of eradicating anything like religious belief, which he is always savagely denouncing as the one great source of man's wickedness and misery. In this he is terribly in earnest, and he is never so eloquent as when he is striking at this hated enemy. The often-quoted verse, 'Tantum religio potuit suadere malorum,' expresses his innermost conviction, and out of this springs his finest and most vigorous poetry. A calm and tranquil mind was his *summum bonum*, and the only way to it lay through a materialistic philosophy which teaches that immortality is an empty dream. To Lucretius this was a positively delightful thought; he hailed

it as a sure deliverance from the worst terrors which haunt men's minds. The universe, as it exists, was, he held, evolved out of ultimate elementary atoms, infinite in number, streaming downwards in void space, like a huge snowstorm; this, or something like it, was the theory of Democritus. Creation, as we understand it, is impossible; nothing can come out of nothing, neither can anything be destroyed; destruction is only a name for a change of substance. Life, mind, soul, &c. are simply parts of the man in the same sense as his limbs, and being in their nature corporeal, being, as we should say, functions of the body, they perish finally with the body, or at least so perish as to leave no survival of consciousness. All knowledge is derived from the senses, which are in fact our only test and criterion of truth. All phenomena can be explained by natural causes, and thus the door is closed against any belief in the divine or supernatural. Lucretius, in fact, is substantially in accord with modern materialism, and he often reminds us of some of the newest theories of modern science. For instance, he explains contagious diseases by the perpetual flying about in the air of minute particles, germs as we call them, injurious to life; and again, in his account of the various types of animal life as they successively appeared on the earth, we have something like anticipations of the 'survival of the fittest,' and of the Darwinian theory of evolution. Every now and then, indeed, there is quite a modern flavour about the doctrines of Lucretius. Still, it is as a poet that he has his chief interest for us, though the man himself, in his intense earnestness, no doubt put his philosophy before his poetry. A very readable book might be made up with the title 'The Beauties of Lucretius.' His poem abounds in strikingly picturesque phrases, such as only a great poet could have originated; scattered up and down in it are episodes of exquisite pathos and vivid description, perhaps hardly to be equalled in the whole range of Latin poetry. Now and then he allegorises some of the popular myths and legends, showing how they foreshadow moral truths, and in such passages he is one of the sublimest and most impressive of poets.

For a full discussion of Lucretius and his poetry, see Professor Sellar's *Roman Poets of the Republic* (1863); Professor Veitch's *Lucretius and the Atomic Theory* (1875); and *The Atomic Theory of Lucretius*, by John Masson (1884). The first edition of Lucretius was printed about 1473 at Brescia; this was followed in 1500 by the Aldine (published by Aldus), and in 1563 by the edition of Lambinus, which from that time held its place for upwards of three centuries as the standard text. In 1832 appeared the edition of the great German scholar Lachmann, in which the text was thoroughly revised, and on this in 1870 Munro greatly improved, adding a most valuable commentary and a close and vigorous prose translation. Creech's translation into English verse (1714) was the work of an enthusiastic admirer of the poet and his philosophy; it is on the whole a good piece of work, but is little known.

Lucullus, L. LICINIUS, a very distinguished Roman general, born about 110 B.C. In the first Mithridatic war he commanded the fleet as legate of Sulla. In 74 B.C., as consul, with Cilicia for his province, he defeated Mithridates (q.v.), and almost annihilated his army on its retreat. In 71 B.C. Pontus became subject to the Romans. The measures which Lucullus now introduced in the government of the province of Asia show that he was a just, wise, and humane administrator; but his troops grew disaffected on account of the strictness of his discipline. In the spring of 69 B.C. he marched into Armenia, and gained a complete victory over Tigranes. In the following year he gained another great victory at the river Arsianus over a new army led against him by Tigranes and

Mithridates; but the mutinous spirit of the legions daily increased, and soon he could do nothing. At last he was superseded by Pompey, and left Asia in 66 B.C. In conjunction with the aristocratic party, he attempted to check the increasing power of Pompey, and the attempt caused the coalition known as the first triumvirate. But he was ill fitted to act as leader against such unscrupulous men, and soon withdrew altogether from political affairs. During his public career he had acquired (but not unfairly) prodigious wealth; and he spent the remainder of his life surrounded by artists, poets, and philosophers, and exhibiting in his villas at Tusculum and Neapolis, and in his house and gardens at Rome, a luxury and splendour which became proverbial. He died about 57 B.C.

Lucy, St., a virgin who was martyred under Diocletian at Syracuse. She is the patron of the blind, and is commemorated on 13th December.

Luddites, bands of workmen who went about the midland counties of England between 1812 and 1818 destroying machinery, to the introduction of which they attributed the want of work consequent on the commercial depression. They took this name from one Ned Ludd, a Leicestershire idiot, who had in a passion destroyed some stocking-frames thirty years before, and their outrages commenced at Nottingham in November 1811, and extended during the following spring and summer through the counties of Derby and Leicester, and through Cheshire, Lancashire, and Yorkshire. In July 1816 they broke out with greater vigour, and destroyed every lace machine in Loughborough, while their leader openly declared his readiness to march 100 miles to destroy any machinery working under price. In October of the same year another party broke thirty machines in Leicester; but soon after, the riots of the Luddites are lost sight of in the wider and more formidable political riots which marked this period, and make the social history of 1816 little more than a long catalogue of disturbances. See *The Risings of the Luddites, Chartists, and Plug-drawers*, by Frank Peel (2d ed. 1888).

Lüdenscheid, a town of Westphalia, 19 miles ESE. from Elberfeld-Barmen, is the seat of numerous hardware manufactures, such as metal buttons, buckles, teaspoons and teapots, mountings for umbrellas and sticks, and musical instruments, besides iron-foundries and machine-shops. Pop. (1875) 8555; (1885) 15,067.

Luderitzland, a name sometimes given to Angra-Pequena (q.v.) and the adjoining territory, now part of German Namaqualand.

Ludhiana, capital of the Ludhiana district (area, 1375 sq. m.; pop. 618,835 in 1881), in Punjab, India, stands 8 miles from the south bank of the Sutlej, and on the Sind, Punjab, and Delhi Railway. It was founded in 1480 by the princes of Delhi, and is now a thriving corn-mart and has manufactures of Cashmere shawls, scarves, cottons, turbans, furniture, and carriages. Pop. 44,163. The shrine of a Mohammedan saint here attracts a large concourse of pilgrims every year.

Ludlow, a market-town and municipal borough of Shropshire, at the Corve's influx to the Teme, 28 miles S. of Shrewsbury. It is a very old and interesting place, with two noble monuments of antiquity. First, there is the massive Norman keep, 110 feet high, of the castle, where Prince Arthur wedded Catharine of Aragon, and died less than five months afterwards; where, in the banquetting-hall, Milton produced his *Comus*; and where, too, Butler wrote *Hudibras*. Captured by King Stephen, the Lancastrians, and the Round-heads, it was finally dismantled in 1689. Secondly, there is the cruciform collegiate church (restored

1863-91), Perpendicular in style, with a tower 130 feet high. The grammar-school, founded in 1282, and refounded in 1552, is almost the oldest in the kingdom; and one of seven gates still remains. From Edward IV.'s reign till 1867 Ludlow returned two members, then one till 1885. Stanley Weyman is a native. Pop. (1851) 4730; (1881) 5035; (1891) 4460. See works by Wright (1826-69) and Baker (2d ed. 1889); and for Ludlow formation, SILURIAN.

Ludlow, EDMUND, a sturdy English republican and regicide, was born of a good old family at Maiden Bradley, Wiltshire, in 1617; studied at Trinity College, Oxford; and at the outbreak of the Civil War was a student in the Temple. He volunteered into Essex's lifeguards, saw service under Waller and Fairfax, was returned in his father's room to parliament for Wiltshire in 1646, sat among the king's judges, and had a place in the council of state of the Commonwealth. In 1651 he was sent to Ireland as lieutenant-general of horse, and held the chief command for six months between the death of Ireton and the arrival of Fleetwood. He refused to recognise Cromwell's protectorate, and until his death took no further part in public affairs. Returned to parliament for Hindon in 1659, he urged the restoration of the Rump, held command again for a few months in Ireland, was nominated by Lambert to the committee of safety, and strove in vain to reunite the broken ranks of the old republican party. Four months after the Restoration he fled to France for safety, making his way to Vevey in Switzerland, where he lived in seclusion, troubled only by the dread of Cavalier assassins. After the Revolution he returned to England, but, the House of Commons presenting an address to William III, craving for his arrest, he returned to Vevey, and died there in 1692. Ludlow's *Memoirs* is one of the best contemporary sources of knowledge we possess, and its author was a man of solid, stubborn, and truthful temper. It covers the whole period from 1640 to 1688, and was first printed in three volumes in 1698-99; new ed. by Firth (1894).

Ludwigsburg, a town of Württemberg, 8 miles N. of Stuttgart. It grew up round a hunting castle founded in 1704 by Duke Eberhard Ludwig, is the second royal residence, and one of the principal garrison towns, of the kingdom; and has a military school and a royal castle, with picture-gallery and splendid gardens. Pop. (1885) 16,187. Ludwigsburg was the birthplace of D. F. Strauss, Justinus Kerner, Moricke, and Friedrich Vischer.

Ludwigscanal. See GERMANY, Vol. V. p. 172.

Ludwigshafen, a town of the Bavarian Palatinate, stands on the left bank of the Rhine, opposite Mannheim. It was granted town rights only in 1859, and has grown rapidly owing to its manufactures (soda, aniline dyes, wagons, &c.) and its trade in iron, timber, coal, and agricultural products. Pop. (1864) 3911; (1875) 42,093; (1885) 24,012; (1890) 33,216.

Luffa. See LOOFAL.

Lugano, a town in the Swiss canton of Ticino, stands on the north-west shore of the lake of the same name, 49 miles by rail N. by W. from Milan. In appearance the place is thoroughly Italian; villas stud the lower slopes of the hills embosomed in vineyards, olive and orange groves, chestnut and walnut woods. The church of Santa Maria degli Angioli has interesting works of art by Luini. An important cattle fair is held here in October. Mazzini and the Italian patriots made Lugano their headquarters for some time after 1848. From Monte Salvatore (2982 feet), in the vicinity, a magnificent view may be obtained. Pop. 6129.—The LAKE OF LUGANO, also called CERESIO, lies at

the southern foot of the Alps, 889 feet above sea-level. Its length is 14½ miles, its average breadth 1½ mile; area, 18½ sq. m. The depth varies very greatly, the maximum being 945 feet, whilst the average is only about 246 feet.

Lugdunum. See LYONS, LEYDEN.

Lugo (*Lucus Augusti* of the Romans), capital of a province in the north-west of Spain, is situated on the Minho, 72 miles by rail S.E. of Comma, and is still surrounded with old walls, high and thick, with towers. It has a cathedral built in 1129-77, and manufactures of linen and leather. It was celebrated as early as the time of the Romans for its warm sulphur baths. Pop. (1894) 19,701.—The *province*, a mountainous but agricultural region, drained by the Minho and its tributary the Sil, and rich in minerals that are but little extracted, has an area of 3787 sq. m., and a pop. (1887) 431,644.

Lugo, a town of Italy, 18 miles by rail W. of Ravenna, has a trade in corn, hemp, wine, and a celebrated fair (all September). Pop. 9189.

Lugsail. See SAIL.

Lugworm. See LOBWORM.

Luini, or LOVINO, BERNARDINO, a painter of the Lombard school, was born about 1470 at Luino, near the Lago Maggiore. He developed his skill in the school of Leonardo da Vinci; indeed many of his works used to be attributed to Leonardo. Luini's principal charms are a certain poetic grace and beauty. He died some time after 1530. He painted frescoes in the Ambrosian Library, in the Brera Gallery, and in the church of St Maurizio, all at Milan. Other works hang in the church at Lugano. His best-known easel-works include 'The Virgin Enthroned' (Brera), 'The Daughter of Herodias' (Louvre), 'Christ disputing with the Doctors' and 'Vanity and Modesty' (London), &c. Luini is one of the five great painters whose 'supremacy' Ruskin has affirmed. See G. C. Williamson's *Bernardino Luini* (1899).

Luke (*Loukas*—i.e. *Lucas*, perhaps shortened from *Lucanus*, as Silas from Silvanus), a companion of St Paul, mentioned in Col. iv. 14 as 'the beloved physician'; his absence from the list in Col. iv. 10-11 leads to the inference that he was a Gentile, and his name is suggestive of an Italian origin. Church tradition since Eusebius has made him a native of Antioch in Syria, and will have it that he was one of 'the seventy' mentioned in Luke, x. 1, 17, that after Pentecost he laboured in Bithynia, Greece, and Gaul, and that, after attaining a good old age, he died a martyr. The further tradition that he was a painter cannot be traced to an earlier date than the 8th century. He is named for the first time as author of the third canonical gospel in the Muratorian canon (2d century); and tradition has ever since been unvarying in ascribing to him both that work and its continuation, the Acts (q.v.) of the Apostles. With respect to the date and authorship of the last mentioned book, all that can be said here is that the majority of modern critics are of opinion that it cannot have been written by a companion of St Paul. When compared with the genuine epistles of that apostle, it exhibits many important discrepancies in detail; of these the most striking perhaps are those which are seen when Acts xv. and Gal. ii. are carefully read together. The author of the Acts, however, had access to a variety of written, as well as oral, sources of information, and to the former class belonged the document the presence of which can still be distinguished in his narrative by the use of the pronoun 'we.' There is good reason to believe that Luke is the companion of St Paul who here speaks in the first person, and, this being so, it is

not difficult to understand the process by which the authorship of the whole work ultimately came to be attributed to him. As regards the third gospel it is to be observed that its author in his preface expressly disclaims to have been an eye-witness of any of the events he records, and does not make the least pretension to any special apostolic sanction or authority. He is frankly a compiler, working after a considerable accumulation of literary material has taken place; who hopes to excel those who have gone before him in fullness of matter, accuracy of detail, comprehensiveness of scheme, and orderliness of method. That, if not himself a Gentile, he writes chiefly for Gentile readers is evident from such circumstances as the manner in which he habitually makes use of the Septuagint translation, his abstinence from Aramaisms, his referring to localities always by their Greek names, and the like. Amongst the documents employed by him the most important were the collection of 'logia,' or discourses and sayings of the Lord by Matthew, and some form of the gospel according to Mark (see GOSPELS). He must have had other sources for the details he has handed down regarding the nativity, and for the canticles which he alone has preserved. Working as he did, most probably in Rome, it was natural that he should reflect in his gospel much of the teaching of St Paul; the fact that he did so is indicated in the tradition (Eusebius) according to which that apostle alluded to the work of Luke in the expression, 'My gospel.' As regards date, the third gospel must be placed at least later than the destruction of Jerusalem (Luke, xxi. 20, 24; xix. 43, 44), and also in all probability some years later than the gospel according to Matthew.

See the commentaries of Lange, Meyer, Keil, P. Campbell (1892), and Plummer (1897); and GOSPELS.

Lukuga, an intermittent outflow from Lake Tanganyika (q.v.) into the Congo.

Lulea, the capital of the Swedish county of Norbotten, is situated at the mouth of the river Luleå, on the north-west coast of the Gulf of Bothnia. It exports timber, tar, salmon, reindeer-bides, and the produce of the Gellivara iron-mines (situated 126 miles N.W. from Lulea). In October 1888 a beginning was made with the construction of the northernmost railway in Europe (304 miles long), to run from Luleå north-westwards along the north of Sweden and Norway to Ofoten Fjord in the north of the latter country. Pop. 3392.

Lully, GIOVANNI BATTISTA, musical composer, was a Florentine by birth, born in 1633. Taken to Paris whilst still a boy, he attracted the attention of Louis XIV. by his violin-playing. The king made him director of the royal orchestra, and eventually (1672) director of operatic affairs in Paris. In collaboration with Quinault, Lully composed a great number of operas, some of which kept the stage until the time of Gluck (*circa* 1778). It was by making the ballet an essential part of the opera that Lully achieved this success. The favourites amongst his operas were *Thésée*, *Armide*, *Phaëton*, *Atys*, *Isis*, and *Acis et Galatée*. He died at Paris on 23d March 1687. A friend of Molière, he composed music for some of his comedies. See OPERA; and Rude's great monograph (1891).

Lully, RAYMOND, 'the enlightened doctor,' was born at Palma, in Majorca, in 1234. In his youth he led a dissolute life, and served for some time as a common soldier; but, a complete revulsion of feeling taking place, he withdrew to solitude, and gave himself up to ecstatic meditations and the study of the occult sciences. This sudden change of life produced in Lully a fervid and enthusiastic state of mind, under the influence of which he formed the project of a spiritual crusade

for the conversion of the Mussulmans, an idea he never afterwards abandoned. In pursuance of this project he commenced an earnest study of theology, philosophy, and the Arabic language, and after some years published his great work, *Ars Generalis sive Magna*, which has so severely tested the sagacity of commentators. This work is the development of the method of teaching known subsequently as the 'Lullian method': a mechanical aid to the mind in the acquisition of knowledge and the solution of all possible problems by a systematic manipulation of certain fundamental notions (the Aristotelian categories, &c.). He even invented a machine (of tin or pasteboard) to assist in this great task. Yet in this departure from scholastic logic, and his zeal for a true interpretation of nature, he was really a precursor of Bacon.

Lully subsequently published another remarkable work, *Libri XII. Principiorum Philosoph. contra Averroistas*, and, full of the principles which he had developed in this book, he went to Tunis in 1292 to argue with his Mohammedan opponents. Ere long he was thrown into prison and condemned to banishment. After lecturing at Naples for several years he proceeded to Rome, thence to his native island of Majorca, thence to Cyprus and Armenia. In 1306 he again sailed for Africa, entered the city of Bugia, now Bougie (q.v.), in Algeria, was again thrown into prison, and again banished. At Paris he lectured against the principles of Averroes. But his missionary zeal could only be satiated by martyrdom. Sailing once more for Africa, at Bugia he was stoned and ill-treated so that he expired a few days afterwards on board a Genoese vessel (1315). The Lullists combined a religious mysticism with a belief in alchemy.

See Helfferich, *Raymond Lull* (1858); Canalezas, *Las Doctrinas de R. Lullo* (Madrid, 1870); and the editions of his works by Salzing (Mainz, 1742) and Rossello (Palma, 1886 *et seq.*).

Lumbago is a rheumatic affection of the muscles or fibrous tissues in the lumbar region, or small of the back. It is often first recognised by the occurrence of a sharp stabbing pain in the loins upon attempting to rise from the recumbent or sitting position. It is sometimes so severe as to confine the patient to bed and in one position, from which he cannot move without intense suffering; but in milder cases he can walk, although stiffly and with pain, and usually with the body bent more or less forward. It may be distinguished from inflammation of the kidneys by the absence of the peculiar direction of the pain towards the groin, as also by the absence of the nausea and vomiting and other constitutional symptoms which usually accompany the disease of the kidney.

The causes of lumbago are the same as those of sub-acute rheumatism generally. The complaint may arise from partial exposure to cold, especially when the body is heated, and violent straining will sometimes induce it. In persons with a strong constitutional tendency to rheumatism the slightest exciting cause will bring on an attack of lumbago.

The treatment must vary with the intensity of the affection. In most cases a warm bath at bedtime, followed by ten grains of Dover's powder, or full doses of alkaline remedies, as citrate of potassium, will speedily remove it; and, as local remedies, a mustard poultice, a mixture of chloroform and soap-liniment, or the application of the heated hammer made for the purpose will be found serviceable. (See also the treatment for RHEUMATISM.) The disorder has been known to completely disappear after one application of the hammer, which should be heated in a spirit-lamp to somewhere about 200°, and then be rapidly brought in contact with points of the skin over the painful parts at intervals of about half an

inch. Each application leaves a red spot, but blisters seldom occur if the operation is properly performed. The application of a hot iron, used just as in ironing clothes, with two or three folds of blanket between it and the skin, frequently gives great relief.

Lumber. See TIMBER.

Luminosity. See LIGHT, PHOSPHORESCENCE, PHOTOMETRY.

Luminous Paint, a phosphorescent powder, such as sulphide or oxysulphide of calcium, ground up with a colourless varnish or other medium, and used as a paint. Even after daylight is over the Phosphorescence (q.v.) goes on, and the object painted remains visible in the dark. See Balmain's British patent, No. 4152 (1877).

Lumpsucker, or LUMFISH (*Cyclopterus*), a genus of fishes of the family Discoboli, having the head and body deep, thick, and short, the back with an elevated ridge, which contains within it the anterior dorsal fin, the skin without scales, but with rows of rough bony tubercles, the fins rather small, and the ventrals united by a membrane so as to form a sucking disc.—One species (*C. lumpus*) is common on the coasts of Britain, particularly in the northern parts, and is still more plentiful in the

Lumpsucker (*Cyclopterus lumpus*).

seas of more northern regions. It is frequently, especially in spring, taken in large numbers in salmon stake-nets. It has a grotesque and clumsy form, but its colours are very fine, especially those of the male, combining various shades of blue, purple, and rich orange. It attains a pretty large size, sometimes weighing seven pounds. The lumpsucker preys on smaller fishes. Its sucker is so powerful that a pail containing some gallons of water has been lifted when a lumpsucker contained in it was taken by the tail. It deposits large adhesive ova which stick together in large masses attached to stones or piles near low-water mark; they are guarded during development by the male. The young are without the tubercles and resemble tadpoles; they have the ventral sucker even when first hatched. It breeds in spring. Its flesh is insipid at some seasons, but very fine at others, and is much used for food in northern regions. It is known in Scotland as the *Cock-paiddle*, probably from the resemblance of its dorsal ridge to a cock's comb; the female, which is larger than the male, is usually distinguished as the *hen-paiddle*.

Lunacy. See INSANITY.

Lunar Caustic. See CAUSTIC.

Lunar Theory, a term employed to denote the *a priori* deduction of the moon's motions from the principles of gravitation. See MOON.

Lunawara, a small state of India, under British protection, in the province of Gujarat, has an area of 388 sq. m. and a pop. of 75,450. The region is hilly, stony, and well wooded. The capital, from which the state derives its name, is

60 miles N. by W. from Baroda, near the Mahi River. Pop. 9059.

Lund (*Lundinum Gothorum*), a city of Gothland, in the extreme south of Sweden, by rail 374 miles SW. of Stockholm and 10 NE. of Malmo. In the 10th century it was a large and powerful city, was made a bishopric in 1048, and an archbishopric in 1104. The archbishop claimed ecclesiastical supremacy over the whole of Scandinavia. At the same period Lund was the chief seat of the Danish power in the Scandinavian peninsula, and for a long period the capital of the Danish kingdom; at the epoch of its greatest prosperity it is said to have had 200,000 inhabitants. But after the introduction of the Reformation by Christian III. in 1536, the city began to decay, and had sunk down to a mere village before the end of the 17th century. The principal building is the fine Romanesque cathedral, dating from the 11th century; it has an imposing crypt. Lund owes its revival to the founding there of a university in 1668 by Charles XI. It is now attended by about 800 students, and has a library of 120,000 volumes and 3000 MSS., an excellent zoological museum, and a botanic garden. Tegner was a professor from 1813 to 1826, and here he composed his masterpiece, *Erdljof*. Pop. (1885) 14,835.

Lundy (Scand., 'grove island'), a granitic island of Devonshire, in the mouth of the Bristol Channel, 11½ miles NNW. of Hartland Point, 17 NW. of Clovelly, 24 W. of Hiracombe, and 30 SSE. of St Gowan's Head in Wales. It measures 3½ miles by 1; has rocky and precipitous shores, with only one landing-place on the south side; and attains an altitude of 525 feet. Here, near the southern end of the island, is a lighthouse, built in 1820. The cliffs are the resort of multitudes of sea-fowl. The antiquities include prehistoric kists, remains of round towers and a chapel, and the ruined castle of the Mariscoes (11th to 14th centuries), from whose time on into the 17th century Lundy was a stronghold successively of pirates, buccaneers, privateers, and smugglers. It figures in Kingsley's *Westward Ho!*; was the death-place of 'Judas' Stukely; was garrisoned till 1647 for Charles I.; and in 1834 was purchased for £9870 by the Heaven family. Pop. (1851) 34; (1881) 177; (1891) 53. See Chanter's *Lundy Island* (1877).

Lüneburg, a town of Hanover, situated on the river Ilmenau, 31 miles by rail SE. of Hamburg. Its streets are narrow and its houses medieval, but its suburbs are modern. The 15th century church of St Michael contains the tombs of the Lüneburg princes. The five-aisled church of St John dates from the 14th century, is pure Gothic in style, and has a tower 371 feet high. The medieval town-house is adorned with old pictures and stained glass. A salt mine, discovered in 906, still has an annual yield of 21,250 tons. There are also a gypsum-mine, iron-works, chemical manufactories, &c. Lüneburg lampreys are well known in Germany. Pop. (1885) 19,336. Although existent in 795, the place only began to acquire importance after the founding of the Benedictine monastery in 994; it was greatly increased by the settlement here of large numbers of the people of Bardowick, destroyed in 1189. Lüneburg afterwards joined the Hanseatic League, and was the capital of an independent duchy. But it lost the greater part of its privileges in the 16th century, and in the 17th suffered much from the Swedes and their enemies. It began to revive again in the 19th century. Near by the Allies defeated the French on 21 April 1813.

The principality of Lüneburg, or rather Brunswick-Lüneburg, existed from 1235 to 1369, from 1373 to 1532, and from 1546 onwards. From the

princes of this house is descended the reigning house in Great Britain (see BRUNSWICK). South of Lüneburg stretches for 50 miles on end the Lüneburg Moor (*Heide*), a grazing-ground for sheep. It produces also honey, buckwheat, and numerous wild berries, and is largely clothed with fine heather. See History by Jürgens (1891).

Lunel, a town in the south of France, 14 miles by rail NE. of Montpellier, with a trade in Muscatel wine and brandy. Interesting human remains have been found in a cave at Pondres, 6 miles N. of Lunel. Pop. 6460.

Lunette. See FORTIFICATION.

Lunéville, a town in the French department of Meurthe-et-Moselle, at the confluence of the Meurthe and the Vezouse, and 20 miles by rail SE. of Nancy. It was formerly a residence of the Dukes of Lorraine; their palace, built by Duke Leopold, in which the Emperor Francis I. was born, is now used as a cavalry barrack, this town being one of the largest cavalry stations in France. Here was signed the peace of Lunéville, on February 9, 1801, between Germany and France, on the basis of the peace of Campo-Formio (q.v.). The industry embraces gloves, hosiery, cottons, &c. Pop. (1872) 12,251; (1886) 20,114.

Lungs. See RESPIRATION (ORGANS OF); and for diseases of the lungs, the articles on CONSUMPTION, PNEUMONIA, PLEURISY, &c.

Lungwort, or OAK-LUNGS (*Stictis pulmonaria*), a lichen with a foliaceous, leathery, spreading thallus, of an olive-green colour, pale brown when dry, pitted with numerous little cavities and netted, much lacinated; the shields (*apothecia*) marginal, reddish brown with a thick border. It grows on trunks of trees in mountainous regions, in Britain and other European countries, sometimes almost entirely covering them with its shaggy thallus. It has been used as a remedy for pulmonary diseases. It is nutritious, and, when properly prepared, affords a light diet, capable of being used as a substitute for Iceland moss; yet it is bitter enough to be used as a substitute for hops. It yields a good brown dye.—The name lungwort is also given to a genus of planerogamous plants (*Pulmonaria*) of the natural order Boraginæ. The common lungwort (*P. officinalis*) is a rare and rather doubtful native of Britain, although common in some parts of Europe. It has ovate leaves and purple flowers, and was formerly employed in diseases of the lungs, but seems to have been recommended chiefly by a fancied resemblance to the lungs in its spotted leaves. It is mucilaginous and contains nitre. It has been used as a pot-herb.

Lunkah, better LANKA, Sansk. 'island,' is specially used of Ceylon, and also of a great tobacco-growing district in the delta of the Godavari.

Lupercalia, a festival among the ancient Romans, held on the 15th of February, in honour of Lupercus, the god of fertility. When Rome began to seek a Grecian origin for its religious ceremonies Lupercus was identified with Lycean Pan, and his worship was said to have been introduced by Evander, the Arcadian. Modern scholars place no value on such statements. Lupercus is believed by them to have been one of the oldest pastoral deities of Italy, and everything that is known regarding him and his rites favours this view. These rites were of the rudest and most primitive character, and indicate a high antiquity. Goats and dogs were sacrificed; afterwards the priests (called *Luperci*) cut up the skins of the victims, and twisted them into thongs, with which they ran through the city striking every one they met, especially women, who put themselves in their

way hoping that the god of fertility would be propitious towards them. As the festival is believed to have been at first a shepherd one, this running about with thongs is understood to have been intended as a symbolical purification of the land. The place where the festival was held was called the Lupercal, and was situated on the Palatine Hill. It contained an image of Luperus, covered with a goat's skin. Lupercalia were also held in other cities of Italy.

Lupine (*Lupinus*), a genus of plants of the natural order Leguminosae, sub-order Papilionaceae, mostly annuals, but some of them perennial herbaceous plants, some half-shrubby; and generally having digitate leaves, with rather long stalks. The flowers are in racemes or spikes, the calyx two-lipped, the keel beaked, the filaments all united at the base. The species of lupine are numerous, and are chiefly natives of the countries near the Mediterranean Sea, and of the temperate parts of North and South America. The White Lupine (*L. albus*), a species with white flowers, has been cultivated from time immemorial in the south of Europe and in some parts of Asia, for the sake of the seeds, which are farinaceous and are used as food, although when raw they have a strong, disagreeable, bitter taste, which is removed by steeping in water and boiling. They were a favourite kind of pulse amongst the ancient Greeks and Romans, and still are so in some parts of the south of Europe, although generally disliked by those who have not been accustomed to them. The Yellow Lupine (*L. luteus*), so called from its yellow flowers, and the Egyptian White Lupine (*L. Theriacis*), which has white flowers tipped with blue, are also cultivated in the south of Europe, Egypt, &c. for their seeds, which are similar in their qualities to those of the white lupine. In many countries lupines, and particularly the white lupine, are cultivated to yield green food for cattle, and also to be ploughed down for manure. They grow well on poor and dry sandy soils, which by this process of *green-manuring* are fitted for other crops. Many species of lupine are cultivated in our flower-gardens, having beautiful white, yellow, pink, or blue flowers. The flowers of some species are fragrant. No lupine is a native of Britain. *L. perennis* adorns sandy places from Canada to Florida with its fine blue flowers.

Lupton, THOMAS G. (1791-1873). See ENGRAVING, Vol. IV, p. 381.

Lupuline. See HORS.

Lupus is a chronic disease of the skin, in which dull or livid tubercles are developed, having a tendency to destroy or so seriously to affect the adjacent tissues, with or without ulceration, as always to lead to indelible cicatrices. It was formerly known as *vulvæ lupus*. The disease usually attacks the face, especially the ale of the nose and the lips, but may occur on almost any part of the body. It usually begins in childhood or early adult life, but may recur at a later period. It more often affects the female sex, and is not contagious, nor usually hereditary. It is, in its severer forms, a terrible disease, but is happily of somewhat rare occurrence. It derives its name from the Latin *lupus*, 'wolf,' in consequence of its destructive nature. See TUBERCLE.

Lupus usually commences with the appearance of one or two circular or oval, dull-red, somewhat translucent tubercles, about two lines in diameter. After a time these tubercles increase in number and size, and take on new characters. They may ulcerate, constituting the variety known as *Lupus cecidens*, in which case the ulceration may pursue a superficial or a deep course. Scabs are formed over the ulcers; and as these scabs are thrown off

the ulcer beneath is found to have increased in extent, till great destruction of the soft parts and (in the case of the nose) of the cartilages is effected. The ulcer of lupus has thick red edges, and exudes a fetid, ichorous matter in considerable quantity. When they do not ulcerate, the tubercles are softer than in the previous variety, and form patches of considerable extent, the intervening skin and cellular tissue also swelling and exhibiting here and there dull-red points, which are the summits of the imbedded tubercles. The lips become much enlarged, the nostrils closed with the swelling, the eyelids everted, and the whole face hideous. This variety is known as *Lupus non cecidens*.

The progress of lupus is usually slow, and the sufferings of the patient less than might be expected, in consequence of the sensibility of the parts being diminished from the first. The complaint may continue for years, or even for life, but is seldom fatal. Its causes are not well known; it is thought that a scrofulous habit predisposes to the disease, but in many of those affected the health is otherwise excellent. A bacillus has been found in the diseased tissues, never abundantly, which is indistinguishable from the tubercle bacillus; but lupus is so rarely associated with tuberculous disease elsewhere that it is doubtful whether the two organisms are actually identical.

Treatment.—It is of course desirable that the patient's general health be brought into as vigorous a condition as possible; and for this purpose cod-liver oil, iodide of iron, and other tonics are often useful. But no internal remedy seems to have any reliable effect upon the disease. The local treatment has passed through many variations: the application of strong escharotics, repeated incisions, or scraping away of the diseased tissues, were often successful in modifying or arresting the disease. Less severe measures, however, first recommended in 1886 by Uma of Hamburg, have proved very efficacious. Chief among these is the constant application to the diseased parts of plasters made for the purpose, containing salicylic acid, which, while it has little effect upon the healthy skin, causes gradual breaking down and removal of the diseased tissues, and creasote, which greatly diminishes the pain caused by salicylic acid alone. Under any method of treatment, however, the disease is apt to be obstinate and troublesome.

Luray Cavern, a cave, not large, but remarkable for the vast number and extraordinary shapes of its stalactites, is close to Luray village, Virginia (90 miles NW. of Richmond). Many of these wonderful columns exceed 50 feet in length; numbers of them are hollow, giving out bell-like notes when struck; and the colours range from waxy white to yellow, brown, or rosy red. The cavern, which is lit with the electric light, attracts thousands of visitors every year.

Lurcher, a name applied to any dog with a distinct cross of greyhound. The commonest form of the lurcher is the first cross between the collie and the greyhound, though in some instances they have been bred for many generations without a fresh cross. As the lurcher combines to a great extent the speed of the greyhound and the sagacity of the collie, no hare is able to escape him. The owner of such an animal is an object of suspicion to every gamekeeper.

Lurgan, a thriving town of Ireland, in County Armagh, 20 miles SW. of Belfast by rail. It is but 3 miles south of the shores of Lough Neagh, and the country around is populous and fertile. It has thriving manufactures of cambrics, lawns, damasks, and diapers. Pop. (1891) 11,429.

Luristan, a mountainous province in the west of Persia. Area, 15,060 sq. m.; pop. about 300,000.

It corresponds roughly to the ancient Susiana, was the seat of the ancient Elamite empire, and is now occupied by numerous minor tribes.

Lurlei. See LORELEI.

Lusatia (*Lusitz*), a Wendish district now belonging in part to Saxony and in part to Prussia. It was formerly divided into Upper and Lower Lusatia, which constituted two independent margraviates, including an area of about 4400 sq. m. and a pop. of about half a million. Given in 1319 to Bohemia, and obtained by Matthias Corvinus in 1478, Lusatia was transferred to Saxony in 1635; but, by the Congress of Vienna, the whole of Lower Lusatia and the half of Upper Lusatia was ceded to Prussia. The portion left to Saxony now forms the circle of Bautzen.

Lushais, a wailike race occupying the little-known Lushai Hills in Cachar (Assam), Chittagong (Bengal), and the adjoining parts of Burma. To check their raids on British territory, expeditions have been required—in 1871-72, and again in 1889-90. Their country is now British.

Lusiads. See CAMOENS.

Lusignan, a picturesque town in the French department of Vienne, 17 miles SW. of Poitiers. It has a very fine church dating from the 11th century, but its castle, associated by legend with the fairy Melusine (q.v.), was razed by the Catholics in 1574. The House of Lusignan gave two titular kings to Jerusalem, and four kings to Cyprus. Pop. 1255.

Lusitania. See PORTUGAL.

Lustre, the characteristic appearance of a bright metallic surface, or of air within glass under water as seen under certain angles of total reflection (see REFLECTION). It is supposed to be due to the conflict between the images in the two eyes, which do not coincide in respect of brightness all over the field. A similar result may be obtained by looking with one eye at a white-and-black and with the other at a black-and-white object, the form, sizes, and positions of the objects being such as would otherwise have enabled the observer to blend them into a single stereoscopic image (see STEREOSCOPE); the opposition of brightness makes the stereoscopic binocular image assume a lustrous appearance.

Lustrum (from *laere*, 'to purify' or 'expiate'), the solemn offering made for expiation and purification by one of the censors in name of the Roman people at the conclusion of the census. The animals offered in sacrifice were a boar (*sus*), sheep (*ovis*), and bull (*taurus*), whence the offering was called *Suovetaurilia*. As the census was quinquennial, the word *lustrum* came to mean a period of five years.

Lute (Arab. *El Oul*), an obsolete stringed instrument, which three hundred years ago was as popular as is the piano to-day. It was introduced into Europe by the Arabians, from whose language it derives its name. The Arabian lute was made of twenty-one pieces of maple wood, with a flat face, a round back, and three rosettes in the face. The strings were eight in number, and were tuned in pairs. The date of its introduction and dissemination through Europe is shortly after the conquest of Spain by the Arabians. The European lute possessed originally eight strings. This number was not increased for many centuries. Three new strings were then added, bringing up the number to eleven; of these two were tuned alike, and the odd one, which was also the highest, was called chanterelle. The need of accommodating the lute to the chromatic scale procured the addition of thirteen new strings, until in the 17th century the total of twenty-four was reached, beyond which

number the augmentation did not continue. At that date the lute commonly in use in Europe consisted of a table of fir or pine; a body or belly, composed of convex ribs of pine; a neck, or finger-board, of hard wood, on which were frets, consisting of catgut strings fastened tightly round the neck; a head, on which were placed the pegs or screws that tightened or relaxed the strings in tuning; and a bridge, to which the strings were attached at one end, the other end being fastened to a piece of ivory, between the head and neck. Of the twenty-four strings twelve ran over the finger-board and twelve by the side of it. The performer used his left hand to press the frets, and struck the strings with his right. There were many varieties of the lute; the treble lute was the smallest, the bass lute the largest. The theorbo was a double-necked lute, of which the archlute and the chitarrone were two subordinate varieties. A peculiar description of notation, called *luthatur*, was employed in music written for the lute. The strings were represented by parallel lines, on which were placed letters of the alphabet, referring to the frets; thus, A marked that the string was to be struck open; B, that the first fret was to be pressed; C, the second, and so on. Over the lines were placed crotchets, quavers, &c., which denoted the lengths of the various notes. The Arabian lute is still extant in the East, of a form nearly identical with that described. The European lute survives only in the guitar and similar instruments. The lute is represented on the sculptures of the Egyptian tombs, so that the antiquity of the instrument is immense. For the European lute, see Becker's *Hausmusik in Deutschland* (1840); for the Arabian lute, Rowbotham's *History of Music*, vol. iii. (1887).

Lute (Lat. *lutum*, 'clay'), in Chemistry, denotes a substance employed for effectually closing the joints of apparatus, so as to prevent the escape of vapour or gases, or for coating glass vessels so as to render them more capable of sustaining a high temperature, or for repairing fractures.

Lutetia. See PARIS.

Luthardt, CHRISTOPH EUGST, Lutheran theologian, born at Maroldsweisach in Lower Franconia, 22d March 1823, studied at Erlangen, and became professor of Theology at Marburg in 1854, and in 1856 at Leipzig. His Commentary on John's Gospel (1852; 2d ed. 1875) has been translated into English, as has also *St John the Author of the Fourth Gospel*, and works on the saving, the fundamental, and the moral truths of Christianity (*Apokalyptische Vorlesung*). He is also author of a *Compendium der Dogmatik* (1865; 9th ed. 1893), *Die Ethik Luthers* (1867), and *Die Antike Ethik* (1887), besides collections of lectures and sermons. See his *Reminiscences* (2d ed., 1891).

Luther, MARTIN, the greatest of the Protestant Reformers of the 16th century, was born at Eisleben on the 10th November 1483. His father was a miner in humble circumstances; his mother, as Melancthon records, was a woman of exemplary virtue (*exemplar virtutum*), and peculiarly esteemed in her walk of life. Shortly after Martin's birth his parents removed to Mansfeld, where their circumstances ere long improved by industry and perseverance. Their son was sent to school; and both at home and in school his training was severe. His father sometimes whipped him, he says, 'for a mere trifle till the blood came,' and he was subjected to the scholastic rod fifteen times in one day! Luther's schooling was completed at Magdeburg and Eisenach, and at the latter place he attracted by his singing the notice of a good lady of the name of Cotta, who provided him with a comfortable home during his stay there. Here under Trebonius

he made good progress in Latin. In 1501, when he had reached his eighteenth year, he entered the university of Erfurt, with the view of qualifying himself for the legal profession. He went through the usual studies in the classics and the schoolmen, and took his degree of Doctor of Philosophy, or Master of Arts, in 1505, when he was twenty-one years of age. Ere this, however, the death of a friend, and the terror of a thunderstorm, had deeply impressed him; and he was led to the study of the Scriptures. Not content with the gospels and epistles in the lectionaries, and failing to find elsewhere a complete Bible (though the whole Vulgate had been translated into German before his time; see BIBLE, Vol. II, p. 127), he had recourse to the Vulgate in the university library. His heart was touched, and he resolved to devote himself to a spiritual life. He separated himself from his friends and fellow-students, and withdrew into the Augustinian convent at Erfurt. Here he spent the next three years of his life—years of peculiar interest and significance; for it was during this time that he laid, in the study of the Bible and of Augustine, and with the assistance of his life-long friend Staupitz, the foundation of those doctrinal convictions which were afterwards to rouse and strengthen him in his struggle against the papacy. He describes very vividly the spiritual crisis through which he passed, the burden of sin which so long lay upon him, 'too heavy to be borne,' and the relief that he at length found in the clear apprehension of the doctrine of the 'forgiveness of sins' through the grace of Christ.

In the year 1507 Luther was ordained a priest, and in the following year he removed to Wittenberg, destined to derive its chief celebrity from his name. He became a teacher in the new university founded there by the Elector Frederick of Saxony. At first he lectured on dialectics and physics, but his heart was already given to theology, and in 1509 he became a Bachelor of Theology, and commenced lecturing on the Holy Scriptures. His lectures made a great impression, and the novelty of his views already began to excite attention. 'This monk,' said the rector of the university, 'will puzzle our doctors, and bring in a new doctrine.' Besides lecturing, he began to preach, and his sermons reached a wider audience, and produced a still more powerful influence. They were printed and widely circulated in Germany, France, and England, so that the doctrines of salvation by free grace were diffused throughout Europe. His words, as Melancthon said, were 'born not on his lips, but in his soul,' and they moved profoundly the souls of all who heard them. In 1511 he was sent on a mission to Rome, and he has described very vividly what he saw and heard there. His devout and unquestioning reverence—for he was yet in his own subsequent view 'a most insane papist'—appears in strange conflict with his awakened thoughtfulness and the moral indignation at the abuses of the papacy beginning to stir in him. It was when climbing on his knees the steps of the so-called judgment-seat of Pilate that the words, 'the just shall live by faith,' flashed upon his soul and drove him to his feet.

On Luther's return from Rome he was made a Doctor of the Holy Scriptures, and his career as a Reformer may be said to have commenced. The system of indulgences had reached a scandalous height. The idea that it was in the power of the church to forgive sin had gradually grown into the notion that the pope could issue pardons of his own free will, which, being dispensed to the faithful, exonerated them from the consequences of their transgressions (see INDULGENCE). The sale of these pardons had become an organised part of the papal system. Money was largely

needed at Rome to feed the extravagances of the papal court; and its numerous emissaries sought everywhere to raise funds by the sale of 'indulgences'; the principal of these was John Tetzel, a Dominican friar, who had established himself at Jüterbog (1517). Luther's indignation at the shameless traffic which this man carried on finally became irrepressible: 'God willing,' he exclaimed, 'I will beat a hole in his drum.' He drew out ninety-five theses on the doctrine of indulgences, which on 31st October he nailed up on the door of the church at Wittenberg, and which he offered to maintain in the university against all impugners. The general purport of these theses was to deny to the pope all right to forgive sins. This sudden and bold step of Luther was all that was necessary to awaken a widespread excitement. Tetzel was forced to retreat from the borders of Saxony to Frankfort-on-the-Oder, where he drew out and published a set of counter-theses, and publicly committed those of Luther to the flames. The students at Wittenberg retaliated by burning Tetzel's theses. The elector refused to interfere, and the excitement increased as new combatants—Hochstratten, Prierias, and Eck—entered the field. Eck was an able man, and an old friend of Luther's, and the argument between him and the Reformer was especially vehement. In 1518 the latter was joined by Melancthon, who became one of his dearest and most trusted friends.

At first the pope, Leo X., took little heed of the disturbance; he is reported even to have said when he heard of it that 'Friar Martin was a man of genius, and that he did not wish to have him molested.' Some of the cardinals, however, saw the real character of the movement, which gradually assumed a seriousness evident even to the pope; and Luther received a summons to appear at Rome, and answer for his theses (1518). Once again in Rome it is unlikely he would ever have been allowed to return. His university and the elector interfered, and a legate was sent to Germany to hear and determine the case. Cardinal Cajetan was the legate, and he was but little fitted to deal with Luther. He would enter into no argument with him, but merely called upon him to retract. Luther refused, and fled from Augsburg, whither he had gone to meet the papal representative. The task of negotiation was then undertaken by Miltitz, a German, who was envoy of the pope to the Saxon court, and by his greater address a temporary peace was obtained. This did not last long. The Reformer was too deeply moved to keep silent. 'God hurries and drives me,' he said; 'I am not master of myself; I wish to be quiet, and am hurried into the midst of tumults.' Dr Eck and he held a memorable disputation at Leipzig (1519), in which the subject of argument was no longer merely the question of indulgences, but the general power of the pope. The disputation, of course, came to no practical result; each controversialist claimed the victory, and Luther in the meantime made progress in freedom of opinion, and attacked the papal system as a whole more boldly. Erasmus and Hutten joined in the conflict, which waxed more loud and threatening.

In 1520 the Reformer published his famous address to the 'Christian Nobles of Germany.' This was followed in the same year by a treatise *On the Babylonish Captivity of the Church*. In these works, both of which circulated widely, and powerfully influenced many minds, Luther took firmer and broader ground; he attacked not only the abuses of the papacy and its pretensions to supremacy, but also the doctrinal system of the Church of Rome. 'These works,' Ranke says, 'contain the kernel of the whole Reformation.' The papal bull containing forty-one theses was

issued against him; the dread document, with other papal books, was burned before an assembled multitude of doctors, students, and citizens at the Elster Gate of Wittenberg. Germany was convulsed with excitement. Eck (who had been the chief agent in obtaining the bull) fled from place to place, glad to escape with his life, and Luther was everywhere the hero of the hour. Charles V. had at this time succeeded to the empire, and he conveyed his first diet of the sovereigns and states at Worms. The diet met in the beginning of 1521; an order was issued for the destruction of Luther's books, and he himself was summoned to appear before the diet. This was above all what he desired—to confess the truth before the assembled powers of Germany. He resolved—having received a safe conduct—to obey the summons, come what would. All Germany was moved by his heroism; his journey resembled a triumph; the threats of enemies and the anxieties of friends alike failed to move him. 'I am resolved to enter Worms,' he said, 'although as many devils should set at me as there are tiles on the house-tops.' His appearance and demeanour before the diet, and the firmness with which he held his ground and refused to retract, all make a striking picture. He was not allowed to defend his opinions. 'Unless I be convinced,' he said, 'by Scripture and reason, I neither can nor dare retract anything, for my conscience is a captive to God's word, and it is neither safe nor right to go against conscience. There I take my stand, I can do no otherwise. So help me God. Amen.'

On his return from Worms he was seized, at the instigation of his friend, the Elector of Saxony, and safely lodged in the old castle of the Wartburg. The affair was made to assume an aspect of violence, but in reality it was designed to secure him from the destruction which his conduct at Worms would certainly have provoked, he having been placed under the ban of the empire. He remained in this shelter for about a year, concealed in the guise of a knight. His chief employment was his translation of the Scriptures into his native language. He composed various treatises besides, and injured his health by sedentary habits and hard study. His imagination became morbidly excited, and he thought he saw and heard the Evil One mocking him while engaged in his literary tasks: the blot from the inkstand that he hurled at him is still shown on the wall of his chamber. The subject of the personality and presence of Satan was a familiar one with Luther, and he has many things about it in his *Table-talk*.

The disorders which sprang up in the progress of the Reformation recalled Luther to Wittenberg. He felt that his presence was necessary to restrain Carlstadt and others, and, defying any danger to which he might still be exposed, he returned in 1522 to the old scene of his labours, rebuked the unruly spirits who had acquired power in his absence, and resumed with renewed energy his interrupted work. He strove to arrest the excesses of the Zwickian fanatics, and counselled peace and order to the inflamed peasants, while he warned the princes and nobles of the unchristian cruelty of many of their doings, which had driven the people to exasperation and frenzy. At no period of his life is he greater than now in the stand which he made against lawlessness on the one hand and tyranny on the other. He vindicated his claim to be a Reformer in the highest sense by the wise and manly part which he acted in this great social crisis in the history of Germany. In this year also he published his acrimonious reply to Henry VIII. on the seven sacraments. Although he had been at first united in a common cause with Erasmus, estrangement had gradually sprung up between the

scholar of Rotterdam and the enthusiastic Reformer of Wittenberg. This estrangement came to an open breach in the year 1525, when Erasmus published his treatise *De Libero Arbitrio*. Luther immediately followed with his counter-treatise, *De Servo Arbitrio*. The controversy raged loudly between them; and in the vehemence of his hostility to the doctrine of Erasmus Luther was led into various assertions of a very questionable kind, besides indulging in wild abuse of his opponent's character. The quarrel was an unhappy one on both sides; and it must be confessed there is especially a want of generosity in the manner in which Luther continued to cherish the dislike which sprang out of it. In the course of the same year Luther married Katharina von Bora, one of nine nuns who, under the influence of his teaching, had emancipated themselves from their religious vows. The step rejoiced his enemies, and even alarmed some of his friends like Melancthon. But it greatly contributed to his happiness, while it served to enrich and strengthen his character. All the most interesting and touching glimpses we get of him henceforth are in connection with his wife and children.

Two years after his marriage he fell into a dangerous sickness and depression of spirits, from which he was only aroused by the dangers besetting Christendom from the advance of the Turks. Two years later, in 1529, he engaged in his famous conference at Marburg with Zwingli and other Swiss divines. In this conference he obstinately maintained his peculiar views as to the sacrament of the Lord's Supper (q.v.), and, as in the controversy with Erasmus, distinguished himself more by the inflexible dogmatism of his opinions than by the candour and comprehensiveness of his arguments, or the fairness and generosity of his temper. Aggressive and reforming in the first stage of his life, and while he was dealing with practical abuses, he was yet in many respects essentially conservative in his intellectual character, and he shut his mind pertinaciously after middle life to any advance in doctrinal opinion. The following year finds him at Coburg, while the diet sat at Augsburg. It was deemed prudent to entrust the interests of the Protestant cause to Melancthon, who attended the diet, but Luther removed to Coburg, to be at hand for consultation. The drawing up of the Augsburg Confession (q.v.) marks the culmination of the German Reformation (1530); and the life of Luther from henceforth possesses comparatively little interest. He survived sixteen years longer, but they are years marked by few incidents of importance. He died at Eisleben on 18th February 1546, and was buried at Wittenberg.

Luther's character presents an imposing combination of great qualities. Endowed with broad human sympathies, massive energy, manly and affectionate simplicity, and rich, if sometimes coarse humour, he is at the same time a spiritual genius. His intuitions of divine truth were bold, vivid, and penetrating, if not comprehensive; and he possessed the art which God alone gives to the finer and abler spirits that He calls to do special work in this world, of kindling other souls with the fire of his own convictions, and awakening them to a higher consciousness of religion and duty. He was a leader of men, therefore, and a Reformer in the highest sense. His powers were fitted to his appointed task: it was a task of Titanic magnitude, and he was a Titan in intellectual robustness and moral strength and courage. It was only the divine energy which swayed him, and of which he recognised himself the organ, that could have accomplished what he did.

View him as a mere theologian, and there are

others who take higher rank. There is a lack of patient thoughtfulness and philosophical temper in his doctrinal discussions; but the absence of these very qualities gave vigour to his hold, if sometimes crude conceptions, and enabled him to triumph in the struggle for life or death in which he was engaged. To initiate the religious movement which was destined to renew the face of Europe, and give a nobler and more enduring life to the Teutonic nations, required a gigantic will, which, instead of being crushed by opposition, or frightened by hatred, should only gather strength from the fierceness of the conflict before it. To clear the air thoroughly, as he himself said, thunder and lightning are necessary. Upon the whole, it may be said that history presents few greater characters—few that excite at once more love and admiration, and in which we see tenderness, humour, and a certain picturesque grace and poetic sensibility more happily combined with a lofty and magnanimous, if sometimes rugged sublimity.

Luther's works are very voluminous, partly in Latin, and partly in German. Among those of more general interest are his *Table-talk*, his *Letters*, and *Sermons*. His Commentaries on Galatians and the Psalms are still read; and he was one of the great leaders of sacred song, his hymns, rugged, but intense and expressive, having an enduring power.

The most important complete editions of Luther's works are those of Wittenberg (12 vols. German; 8 vols. Latin, 1539-58); Halle, ed. by Walch (German, 24 vols. 1740-53); and Erlangen and Frankfurt (67 vols. German; 33 vols. Latin, 1826-73). A splendid new and complete edition was commenced at Weimar in the year of the fourth centenary of his birth (1883).

His *Briefe, Sendschreiben und Gedanken* were edited by De Wette and Seidenmann (6 vols. 1825-56); the *Briefwechsel*, by Burkhardt (1866); and by Enders (1884 *et seq.*); his *Politische Schriften*, by Mundt (1844); his *Kirchenpostille*, by Francke (1841); his *Tischreden*, by Forstmann and Bindsil (1846-48); his *Geistliche Lieder*, by Wackernagel (1856), Godeke (1883), and A. Fischer (1883). A good selection of the lesser writings is that entitled *Martin Luther als Deutscher Klassiker* (3 vols. Frank. 1871-83).

Of the many Lives the most important are those of Meurer (3d ed. 1870), Jurgens (3 vols. 1846-47), Kostlin (2 vols. 1875; 3d ed. 1883; also a popular ed. 1883), Plitt and Petersen (2d ed. 1883), and Kolbe (1884 *et seq.*). There is an English life of merit by Peter Bayne (1887), and well-known essays by Carlyle, Froude, Tulloch, and others. See also Dr Charles Beard's admirable book, *Martin Luther and his Reformation in Germany until the Close of the Diet of Worms* (1889).

On Luther's theology there are works by Th. Harnack (1862-86), Kostlin (1863), and Lommatsch (1879). The Catholic view is fairly given by Dollinger, and in Janssen's *Geschichte des Deutschen Volkes*.

Lutherans, a designation originally applied by their adversaries to the Reformers of the 16th century, and afterwards distinctively appropriated among Protestants themselves to those who took part with Martin Luther against the Swiss Reformers, particularly in the controversies regarding the Lord's Supper. It is so employed to this day as the designation of one of the two great sections into which the Protestant Church was soon unhappily divided, the other being known as the Reformed Church (q.v.). To the end of Luther's life perfect harmony subsisted between him and his friend Melancthon; but already there were some who stood forth as more Lutheran than Luther, and by whom Melancthon was denounced as a 'crypto Calvinist' and a traitor to evangelical truth. After Luther's death this party became more confident, and, holding by Luther's words, without having imbibed his spirit, changed his evangelical doctrine into a dry scholasticism and

lifeless orthodoxy, whilst extreme heat and violence against their opponents were substituted in the pulpit itself for the zealous preaching of the gospel. The principal seat of their strength was in the university of Jena, which was founded in 1557 for this very object, and maintained their cause against Wittenberg. Great intolerance was manifested by this party; and no controversy was ever conducted with more bitterness than the Sacramentarian Controversy.

Towards the end of the 17th century the Lutherans of Germany found a new object of hostility in the Pietists (q.v.); and in the 18th century they came into conflict with Rationalism (q.v.). When, after the wars of the French Revolution were over, the Prussian government formed and carried into execution a scheme for the union of the Lutheran and Reformed churches into one national church, leaving them free to use either the Lutheran or Heidelberg confession, an active opposition arose on the part of those who now began to be known as *Old Lutherans*. Separate congregations were formed, and an attitude of open hostility to the government was assumed by some; whilst others, more moderate, but holding the same theological opinions, continued to maintain these opinions within the *United Evangelical Church*. The separatists were for some time severely dealt with by the government, and about 1837 many left their native country to found Old Lutheran communities in America. After that time greater toleration was practised, and in 1841 the Old Lutherans became a legally-recognised ecclesiastical body in Prussia. A freer *New Lutheranism*, claiming to represent Luther's spirit rather than the dogmas of the old Lutheran systematists, has since 1848 become practically dominant in most parts of Protestant Germany, in Prussia as well as elsewhere, under the leadership of such men as Hengstenberg, Hofmann, Harless, Luthardt, Thomasius, and Kahnis.

Lutheranism is the prevailing form of Protestantism in Germany; it is the national religion of Denmark, Sweden, and Norway; and there are Lutheran churches in the Baltic provinces of Russia, in Holland, France, Poland, and the United States—in which latter country there were in 1890 as many as 7911 churches, with 1,086,048 members. In all there are some thirty millions of Lutherans. Amongst the Lutheran symbolical books the *Augsburg Confession* (q.v.), Luther's *Shorter Catechism*, and the *Formula Concordiæ* (see CONFESSIONS) hold the principal place. The chief difference between the Lutherans and the Reformed is as to the *real presence* of Christ in the sacrament of the Supper; the Lutherans holding the doctrine of *consubstantiation*—Christ's body present 'in, with, and under the unchanged bread and wine'—although rejecting *transubstantiation* (see LORD'S SUPPER; TRANSUBSTANTIATION; and ZWINGLI); whilst some of their more extreme theologians have asserted not only the presence of the human nature of Christ in the Lord's Supper, as Luther did, but the absolute omnipresence or ubiquity of his human nature. Other points of difference relate to the allowance in Christian worship of things *indifferent* (*adiaphora*); and many of those things at first retained as merely tolerable by Luther and his fellow-reformers have become favourite characteristics of some of the Lutheran churches—as crucifixes and pictures in places of worship, &c.

In its constitution the Lutheran Church is generally *episcopopal*, without being properly *presbyterian*. It is consistorial (see CONSISTORY), with the civil authorities so far in place of bishops. In Denmark, Sweden, and Norway there

are bishops, and in Sweden an archbishop (of Upsala), but their powers are very limited.

See the works of the old systematists Chemnitz, Johann Gerhard, Hutter, Quenstedt; Hase's *Hutterus Redivivus* (1828; 12th ed. 1883); the dogmatical works of Twisten, Nitzsch, and Martensen; and the church histories.

Luton, a market-town of Bedfordshire, on the little Lea, among the Chiltern Hills, 31 miles by rail NNW. of London. St Mary's Church, mixed Decorated and Perpendicular in style, is a noble structure, with a flint-work tower 90 feet high, a baptistery chapel, and many interesting monuments. It has been restored since 1865. Luton is the chief seat in England of the straw-plait (for hats, bonnets, &c.), an industry which dates from the reign of James I., and employs 20,000 persons here and in the neighbourhood. The Plait-hall (1869) is a fine building; and there are also a town-hall, corn exchange, people's park, &c. Luton was re-incorporated as a municipal borough in 1876. Pop. (1851) 10,648; (1891) 30,006. See F. Davis, *History of Luton* (1855).

Lutterworth, a small town of Leicestershire, on the Swift, 8 miles NNE. of Rugby. The fine old church, restored by Scott in 1867-69, contains the pulpit and other relics of Wyclif, who was rector from 1374 till his death on 28th December 1384. He was buried here, but in 1428 his remains were dug up and burned, and the ashes cast into the Swift. 'This brook conveyed his ashes into Avon, Avon into Severn, Severn into the narrow seas, they into the main ocean; and thus the ashes of Wickliffe are the emblem of his doctrine, which now is dispersed all the world over.' Pop. of parish 1800.

Lüttich. See LIÉGE.

Lüttringhausen, a manufacturing town of Rhenish Prussia, 5 miles SE. of Elberfeld. Cloth, calico, and silk, hardware, and brandy manufactures are carried on. Pop. 10,498.

Lützen, a small town of 3501 inhabitants, in the Prussian province of Saxony, famous for two great battles fought in its vicinity. The first, a brilliant victory of the Swedes in the Thirty Years' War, took place on 6th November 1632 (see GUSTAVUS ADOLPHUS). The battle on 2d May 1813 was fought somewhat farther to the south, at the village of Gros-görschen. It was the first great conflict of the united Russian and Prussian army with the army of Napoleon in that decisive campaign; and the French were left in possession of the field.

Lützw, LUDWIG ADOLF WILHELM, FREIHERR VON, born in Brandenburg on 18th May 1782, died at Berlin on 6th December 1834, gave his name to a celebrated corps of volunteers, raised in Silesia during the war of liberation in 1813. It included several celebrated men, as Jahn, Theodor Körner, &c., and was renowned for its ardent patriotism and magnificent courage. The men uniformed themselves, and are often spoken and sung of as the 'Black Rifles' (*Jäger*). Lützw's wife was the Countess of Ahlefeldt, the friend of Immermann.

Luxembourg, DUC DE. François Henri de Montmorency-Bouteville, one of Louis XIV.'s celebrated marshals, was born at Paris on 8th January 1628. A posthumous son, he was trained by his aunt, mother of the Great Condé, to whom he stuck faithfully all through the wars of the Fronde. After 1659 he was pardoned by Louis XIV., who created him Duc de Luxembourg (1661) — he had just married the heiress of the House of Luxembourg-Piney. He again took the field in 1667, serving under Condé in the invasion of Franche-Comté; but, receiving an independent command against the Netherlands in 1672, he successfully invaded the enemy's country, and when compelled to retreat in the winter of

1673 led back his men in such a masterly way as to win the reputation of being one of the greatest generals of the age. His chief exploits during the continuance of the war were to storm Valenciennes and to defeat the Prince of Orange at Mont-Cassel and St Denis. He had been made marshal in 1675. Soon after the conclusion of peace (1678) he quarrelled with the all-powerful minister Louvois, and was not employed again on active duty for twelve years. The story that Louvois implicated him in the affair of the poisoners of Paris is probably a myth, though Luxembourg seems certainly to have spent some part of 1680 in the Bastille. In 1690 he was sent to take command in Flanders, and defeated the allies at Fleurus, and in the following year he twice more routed his old opponent, William III. (formerly Prince of Orange) at Steinkirk and near Neerwinden. He died at Paris on 4th January 1695. Luxembourg had an unerring instinct of the right thing to do on the field of battle, and when to do it. In action he was prompt and bold; but often failed to reap the full advantages of victory owing to his indolence. He was a little man and hump-backed, and addicted to self-indulgence.

Luxemburg, an independent grand-duchy of Europe, wedged in between France, Prussia, and Belgium. It consists of a plateau, furrowed with valleys, and connecting together the uplands of Lorraine, the Forest of Ardennes, and the Eifel; nearly all its streams flow to the Moselle, which for some 20 miles forms its eastern border. The country is well wooded, yields wheat, flax, hemp, and rapeseed, grows wine (1½ million gallons in good years), and is rich in iron ore. The extraction and smelting of this mineral is, next to agriculture, the principal occupation. But leather, gloves, pottery, cloth, paper, sugar, beer, and spirits are manufactured. Area, 998 sq. m.; pop. (1871) 197,528; (1890) 211,088, nearly all Catholics, and of Low German stock, though French is the language of the educated classes. For commercial purposes Luxembourg is included in the German customs union. The dignity of grand-duke belongs to the head of the House of Orange-Nassau, and as such was held by the kings of Holland from 1815 to 1890, when, on the death of King William III. without male issue, it passed to Adolf, Duke of Nassau. The little state is ruled by a House of forty-five Representatives. The head of the government is the minister of state, with whom are associated directors of finance, justice, and internal affairs.—The *Belgian province* of Luxembourg, which down to 1839 formed part of the grand-duchy, lies contiguous to this last on the west; it constitutes the south-eastern extremity of the kingdom of Belgium. In its physical features and its main product it differs little from its neighbour-state, the grand-duchy. Area, 1706 sq. m.; pop. (1891) 212,041. Chief town, Arlon. The *history* of the grand-duchy of Luxembourg begins with the history of the city. On the site of this there stood in the 8th century a castle, which in 738 was given by Charles Martel to the abbey of Treves. The founder of the first line of counts was Siegfried, who in 963 acquired the castle of Lucilinburch or Lutzellurg (i.e. Luxembourg). In 1136 the countship passed to the Counts of Namur. The fourth Count Henry was elected emperor as Henry VII. in 1308, and his son John became king of Bohemia. In 1354 the title was raised from count to duke. In 1444 the duchy was united with Burgundy, and shared the history of that state down to 1659, but it was reckoned a member of the German empire. From 1659 to 1713 Luxembourg was held by the French king. It was again annexed by the French in 1795, and two years later made the department of Forêts. But in 1815 the Vienna Congress created

it a separate state, a member of the German Confederation, but gave it to William I. of Holland. And this position was again declared definitive of the eastern section in 1839. By the London treaty of 1867 it was made a completely independent state, and the Prussian garrison withdrew from the fortress of Luxemburg. **LUXEMBURG**, the capital of the grand-duchy, by rail is 42 miles N. of Metz and 32 SW. of Treves. Its situation has often been compared to that of Jerusalem: the city stands on a rocky platform, connected with the neighbouring country only on the west, and elsewhere engrift by a steep valley, 200 feet deep, in which nestle the industrial suburbs of Klausen, Pfaffenthal, and Grund. The intermediate gorges are crossed by fine viaducts. The Spaniards, Austrians, French, and Dutch, who successively held possession of the town, so increased and strengthened its fortifications, hewn, like those of Gibraltar, in great part out of the solid rock, that in the beginning of the 19th century it was considered to be, with the exception of Gibraltar, the strongest fortress in Europe. But they were demolished in accordance with the treaty of London of 1867, and the site of the walls has been laid out as beautiful gardens. There are in the town the ruins of Count Mansfeld's palace and the cathedral (built in 1613). Pop. (1875) 15,954; (1890) 18,187.

See works by Coster (1869), Schötter (1882), Werveke (1886), Eyschen (1889), and Philips (1894), all in German; and one in French by Glasener (1885).

Luxeuil, a French town in Haute-Saône (pop. 4550), 15 miles NW. of Belfort, with remains of the monastery founded by St Columbanus in 590.

Luxor. See THEBES.

Luynes, Duc DE (1578-1621), the unworthy favourite of Louis XIII. of France, was a page at the court of Henry IV., and became ultimately peer of France and chancellor.

Luzern. See LUCERNE.

Luzon, the largest of the Philippines (q.v.).

Luzula, a genus of plants of the natural order Junaceæ, differing from rushes in having a 3-seeded

Field-rush
(*Luzula campestris*).

instead of a many-seeded capsule, and in having soft plane leaves, which are generally covered with thinly-scattered longish hairs. They do not grow in wet places, like rushes, but in woods, pastures, and elevated mountainous situations (see RUSH). Perhaps there is no more common British plant than the Field-rush (*L. campestris*), a plant of very humble growth; its flowering spikes congregated into a close head, their dark colour relieved by the whitish yellow of the anthers, profusely adorn dry pastures in spring. It is of no agricultural value. The species which grow under the shade of trees preserve their verdure in winter, adding to the beauty of the scene, and improving the cover for game.

Lyall, EDNA, the pen name of Ada Ellen Bayly, author of several popular novels written with a purpose, was born and educated at Brighton, had vague ideas of becoming a novelist even in her tenth year, and at school wrote a good deal of

amateur fiction. Her first novel, *Won by Waiting* (1879), was followed by her most popular story, *Dunorran* (1882), written at Lincoln, with its sequel *We Two* (1884); these are a plea for that charity which takes no account of even the sharpest differences in creed and religion. Her other books are *In the Golden Days* (1885); *Knight Errant* (1887), partly written in Italy, where most of the ideas for this novel were derived; *Autobiography of a Slander* (1887); *Derrick Vaughan* and *A Hardy Norseman* (1889); and a child's book, *Their Happiest Christmases* (1889). Her novels are characterised by thought and quiet humour; her descriptions of both nature and human nature are usually vivid and graceful, and coloured by her own experience of travel. Most of her tales turn on self-sacrifice, while the *Autobiography of a Slander* is directed against the sins of the tongue. She conceives her characters first, then surrounds them with the chain of circumstance for the due development of the story. Like George Eliot with the Liggins imposture, the real 'Edna Lyall' has had to assert herself against an impostor in Ceylon who had adopted her name. Statistics of the books read at several libraries show Edna Lyall's novels to have been most in demand over a certain period.

Lycanthropy. See WERE-WOLF.

Lycæonia, in ancient geography, a country in Asia Minor, bounded E. by Cappadocia, N. by Galatia, W. by Pisidia, and S. by Isauria and Cilicia. Its capital was Ieonium (q.v.).

Lycæum (Gr. *Lukion*), originally the name of a place in the immediate neighbourhood of Athens, consecrated to *Apollon Lycæus*, and noted for its shady wood and beautiful gardens, but particularly for its gymnasium, in which Aristotle and the Peripatetics taught, and from which the Romans borrowed the same name for similar institutions. In more modern times the name lycæum was given in honour of Aristotle to the higher Latin schools in which the Aristotelian philosophy formed a principal branch of education; and at the present day the name is variously applied to educational and literary institutions, especially to the French schools called Lycées (see FRANCE). The term lycæum is frequently employed in America for what would be called in England an academy, association, or society. It may signify also the building in which the society meets.

Lych-gate (A.S. *lic* or *lice*, 'a body,' 'corpse'), or CORPSE-GATE, a churchyard gate covered with a roof. It is very common in many parts of England

Lych-gate.

and Wales. The bodies of persons brought for burial are set down under the shelter of the roof while the opening words of the service are read.

Lych gates are very rare in Scotland; the illustration represents one at Blackford Church, in Perthshire.

Lychnis, a genus of plants of the natural order Caryophyllaceæ. They are herbaceous plants, generally perennial, and natives of temperate countries. Several are found in Britain. The Ragged Robin (*L. flos cuculi*) is one of the most frequent ornaments of meadows and moist pastures; the German Catchfly (*L. viscaria*) is very rare, and generally found growing on almost inaccessible precipices; the Red Campion (*L. diurna*) and the White Campion (*L. vespertina*) abound in fields, hedges, and the borders of woods. The last two are dioecious, and, strangely enough, the female of the first and the male of the second are very common, while the male of the first and female of the second are rather rare. The flowers of *L. vespertina* are usually fragrant in the evening. The Scarlet Lychnis (*L. Chalcedonica*), a native of Asia Minor, is a frequent and brilliant ornament of flower-borders. Some of the species have saponaceous properties.

Lycia, a country on the south coast of Asia Minor, bounded on the W. by Caria, on the N. by Phrygia and Pisidia, and on the E. by Pamphylia. It is a mountainous region, formed by lofty spurs of the Taurus, which reach 10,000 feet in height; the valleys are very fertile. The most ancient inhabitants are said to have been two races called Solymi and Termike. The Lycians are prominent in the Homeric legend of the Trojan war. Lycia maintained its independence against Croesus, king of Lydia, but was afterwards made subject to the Persians and Syrians, and then to Rome. During the time of its independence it consisted of twenty-three confederate cities, of which the principal were Xanthus (the capital), Patara, Pinara, Olympus, Myra, and Thos; and at the head of the whole confederation was a president or governor called the Lyciarch. Many monuments and ruined buildings (temples, tombs, theatres, &c.) and other antiquities testify to the attainments of the Lycians in civilisation and the arts, which they seem to have derived in large measure from Greek sources. Sir Charles Fellows, about 1840, was the first to discover and point out the interesting character of these Lycian remains. A beautiful collection is preserved in the British Museum. There exist also inscriptions in which a peculiar alphabet is used, closely modelled upon the Greek, the language of which appears to be inflected like the Indo-Germanic languages, and was probably akin to Zend.

See Fellows, *Discoveries in Lycia* (1841); Spratt and Forbes, *Travels in Lycia* (1847); M. Schmidt, *The Lycian Inscriptions* (1862); Sayer, *Principles of Comparative Philology* (3d ed. 1885); and Treuber, *Geschichte der Lyker* (1887).

Lycopodiaceæ form a class of isosporous vascular Cryptogams, containing two orders with four genera. Order I.: Lycopodiæ includes the genus *Lycopodium*, with about 100 species which are universally distributed; and the genus *Phylloglossum* with only one species (*P. Drummondii*), found in Australia and New Zealand. Order II.: Psilotæ includes the genus *Psilotum*, with two species which are found in the tropics of both hemispheres, and the genus *Tmesipteris*, with only one known species, which is epiphytic on tree ferns in the southern hemisphere.

Of the four genera the *Lycopodium* is best known under the name of 'Club-moss' or 'Stag's horn moss,' but there is no more than a superficial resemblance between it and the true mosses (Musci). The stem may be creeping as in

L. clavatum, the common club-moss of the British Isles, erect as in *L. Selago*, which is also a British species, or shrubby and stout as in some tropical species.

The Lycopodiaceæ have mostly a dichotomous form of branching. The stems, except in the shrubby forms, are slender, and never reach more than a few feet in length. The leaves are small and undivided, usually overlapping and completely protecting the stem. Special branches are spore-bearing, and one sporangium is borne in the axil of each leaf. Only in some fossil forms are there two kinds of spores (heterosporous). The spore develops a green prothallus, which sends root-hairs into the soil, or a colourless, tubercous subterranean prothallus; but both forms produce on the same individual antheridia and archegonia; the former produce spermatozoids, and the latter oospheres. Fertilisation occurs as in the Fern (q.v.). The sporophyte plant which results from the fertilisation of an oosphere by a spermatozoid is the conspicuous generation, while the oophyte or prothallus is the inconspicuous generation. The roots are simple, and may arise at any point of the stem near the ground. A number of flattened vascular bundles unite at intervals longitudinally in the centre of the stem to form a single axile cylinder, which is surrounded by a sheath, while the rest of the stem around

this is made up of thick or thin walled cells. The elements of the bundle resemble those of ferns. A simple strand passes from the axile cylinder to the midrib of each leaf. Alternation of generations is very strongly marked in *Lycopodium*, but vegetative reproduction of the sporophyte may occur by means of bulbils in the axils of the leaves or on the roots, or by means of adventitious buds on the stems.

The Lycopodiaceæ are very closely related to the higher forms, the Selaginellaceæ, which are heterosporous plants, and to the lower forms, the Ferns, which have simpler sporangia.

The spores of *Lycopodium* are used for coating pills, and the hands rubbed over with the spores may be dipped in water without being wet; they are also used for flash lights in pyrotechnic displays. Many species are medicinal. *L. clavatum* is emetic, and *L. Selago*, cathartic. The spores of many form a powder which is beneficial in ulcerations, &c., and *L. alpinum* is used as a dye. The Lycopodiaceæ may be regarded as the degraded survivors of tree-like forms that were very plentiful in the forests of the Carboniferous period.

Lycurgus, the lawgiver of Sparta, is usually dated about 820 B.C. He was uncle of the young king Charilaos, and governed the state wisely during his nephew's infancy, then travelled over Crete, Ionia, and Egypt, and on his return, finding his country in complete anarchy, made a new division of property, and remodelled the whole constitution, military and civil. Next he bound the citizens by oath not to change his laws until he came back, and then left Sparta to be no more seen. His

Club-moss (*Lycopodium clavatum*):
a, roots; b, creeping stem; c, upright stem; d, vegetative branches; e, stalk bearing the sporangiferous branches; f, f', g, spore-bearing leaf; g, same in section; h, h', sporangium; i, vein of spiral vessels.

memory was honoured as that of a god with a temple and yearly sacrifices.

Lycurgus, an Attic orator, born about 396 B.C., was a pupil of Plato and Isocrates, and warmly supported Demosthenes' policy. He was thrice appointed manager of the revenue. He died in 328. Of his fifteen speeches but one is extant.

Lyddite, a powerful explosive (like melinite), made from picrate of potash. It is made at Lydd, near New Romney, in Kent, where there is a Government artillery range. See **PICRIC ACID**.

Lydgate, JOHN, an admirer and imitator of Chaucer, was born at Lydgate, near Newmarket, in Suffolk, about 1370, and became a monk in the Benedictine monastery of Bury St Edmunds. He studied some time at Oxford, travelled into France and Italy, and returned a master of their poetry. In the monastery he appears to have taught the rhetoric and philosophy of his time, and he wrote poetry with equal ease upon the most widely different themes. His death probably occurred about 1450, and we have his own evidence that his last years were harassed by poverty. Until his old age he seems to have been more of the poet than the monk, but among his later works are a metrical *Life of St Edmund* and the *Legend of St Alban*. Ritson has enumerated in his *Bibliographia Poetica* no fewer than 251 pieces written by Lydgate, and most probably even this list is incomplete. A selection from the minor poems was edited by Mr Halliwell for the Percy Society in 1840. Lydgate's longer works are the *Storie of Thebes*, the *Troy Book*, and the *Falls of Princes*. The *Storie of Thebes* is represented as a new Canterbury tale, told by the author after joining the company of pilgrims at Canterbury. It is written in rhyming ten-syllable couplets, and contains about 4780 lines. Its sources are the *Thebaid* of Statius and the *Teseide* of Boccaccio. The versification is rough, and, indeed, it cannot be denied that the poem is dull and prolix to a degree, the prologue alone excepted. The *Troy Book* was undertaken about 1412, at the request of Prince Henry, afterwards Henry V., and was finished in 1420. It is written also in the ten syllable couplet, and is divided into five books, and founded on Guido di Colonna's Latin prose *Historia Trojana*. Its best-known passage is the long panegyric on his 'Maister Chaucer' in the third book. The *Falls of Princes*, divided into nine books, is written in Chaucer's seven-line stanza, and contains upwards of 7000 stanzas. It was written in 1430 by desire of Humphrey, Duke of Gloucester, and is founded on a French paraphrase by Lawrence de Premierfait of Boccaccio's Latin work, *De Casibus Virorum Illustrium*. Other works that may merely be mentioned here are the *Dance of Macchabe*, or Dance of Death, translated from the French; the *Court of Sapience*; and the *Temple of Glass*, a copy of Chaucer's *House of Fame*.

Lydia, anciently a country of Asia Minor, bounded on the W. by Ionia, on the S. by Caria, on the E. by Phrygia, and on the N. by Mysia. It is said to have been originally inhabited by a people called Meonians, though the Lydians, an allied tribe, probably occupied the plain of Sardis. The country was celebrated for its fruitful soil—except the barren *Katakakmaene* (burned up) volcanic region in the east—and its mineral wealth, particularly for the gold of the river Pactolus and of the neighbouring mines of Tmolus, but was in later ages infamous for the corruption of morals which prevailed amongst its inhabitants, and especially in Sardis (q.v.), its capital. The Lydians, shut out from the Aegean Sea by the Ionian Greeks, developed great commercial activity inland. They likewise distinguished themselves in the textile arts. They

were believed to have been the inventors of coined money, and of dice and other games. Many elements of their civilisation seem to have been derived from the Hittites; Hittite governors ruled for some time at Sardis. The sun-god Attys and Cybele, the mother of the gods, the Hittite-Babylonian Tammuz and Istar, were the deities principally worshipped. Three dynasties are recorded to have ruled over ancient Lydia: the first, wholly mythical, was founded by Attys; the second, usually called the Heraclid, from its founder being a reputed son of Hercules by Omphale, has been identified with the Hittites; the third was founded by Gyges about 690 B.C. This king created a powerful Lydian empire, which attained its greatest period of splendour under his descendant Croesus (q.v.) the rich, who was slain by Cyrus the Persian in 546. Sardis thereafter became the western capital of the Persian empire. Lydia was subsequently subject to Athens, Macedonia, and Rome one after the other. The merest fragments remain of the language, which was apparently Indo-European. For the Lydian mode, see **HARMONY**; and for Lydian stone, **TOUCH-STONE**.

Lye, a term sometimes used to denote all solutions of salts, but more generally appropriated to solutions of the fixed alkalis, potash and soda, in water. The solutions of caustic potash and soda are called caustic lyes; those of their carbonates, mild lyes. The fluid which remains after a substance has been separated from its solution by crystallisation is called the *mother lye*.

Lyell, SIR CHARLES, geologist, was the eldest son of Charles Lyell, Esq., of Kinnorly, Forfarshire, where he was born 14th November 1797. After receiving his early education at Midhurst, in Sussex, he entered Exeter College, Oxford, and graduated as B.A. in 1819. At Oxford he attended the lectures of Buckland, and thus acquired a taste for the science he afterwards did so much to promote. After leaving the university he studied law, and in due time was called to the bar; but his circumstances not rendering a profession necessary for a livelihood, he devoted himself to geology, and made tours in 1824, and again in 1828-30, over various parts of Europe, and published the results of his investigations in the *Transactions of the Geological Society* and elsewhere. His great work, *The Principles of Geology* (3 vols. 1830-33), may be ranked next after Darwin's *Origin of Species* among the books which have exercised the most powerful influence on the direction of scientific thought in the 19th century. It broke down the belief in the necessity of stupendous convulsions in past times; and taught, as had long before been maintained by Hutton and Playfair, that the greatest geological changes might be produced by the forces still at work on the earth. It was subsequently divided into two parts, published as two distinct works—viz. *The Principles of Geology; or the Modern Changes of the Earth and its Inhabitants* (12th ed. 1876); and *The Elements of Geology; or the Ancient Changes of the Earth and its Inhabitants. The Geological Evidences of the Antiquity of Man* (1863) startled the public by its unbiased attitude towards Darwin's *Origin of Species*. Lyell also published *Travels in North America* (1845) and *A Second Visit to the United States* (1849). During the second sojourn, when he also visited Nova Scotia, he estimated the recession of the rock at Niagara, and the amount of deposition of alluvium at the delta of the Mississippi. On the opening of King's College, London, in 1832 Lyell was appointed professor of Geology, an office which he soon resigned. In 1836, and again in 1850, he was elected president of the Geological Society,

and in 1864 president of the British Association. He was knighted in 1848, and created a baronet in 1864. He died 22d February 1875, and was buried in Westminster Abbey. See his *Life, Letters, and Journals* (2 vols. 1881); and the article GEOLOGY.

Lykewake. See WAKE.

Lyly, JOHN, romance-writer and dramatist, was born in the Weald of Kent about 1553. He became a student of Magdalen College, Oxford, in 1569; B.A., 27th April 1573; M.A., 1st June 1575. In Lansdowne MS. 19 is preserved a Latin letter (written in 1574) in which he begs Lord Burghley to help him towards procuring a fellowship at Magdalen College; but the application does not appear to have been successful. He afterwards studied at Cambridge, where he was incorporated M.A. in 1579. Failing to gain preferment at the universities, he followed the court. Among the Harleian MSS. are two undated petitions to Queen Elizabeth, begging that he might be appointed Master of the Revels. In the first he writes: 'I was enterteyned yo^r Ma^s s^vant by yo^r owne gracious fauour, strengthened with condicions, that I should ayme all my courses at the Reuells (I dare not saye with a promise, but a hopefull Item to the reu^econ) for w^{ch} these 10 yeres I have attended with an unwearyed patience, and nowe I knowe not what Crabb took me for an Oyster, that in the midst of yo^r sunshine of your most gracious aspect, hath thrust a stone betwene the shells to eate me alive that onely live on deal hopes.' The tone of the second letter is even more desponding: 'Thirteene yeres your highnes seruant, but yet nothing. . . . A thousand hopes, but all nothing: a hundred promises, but yet nothing.' He found a patron in Lord Burghley, who gave him some post of trust in his household. In 1589 he took part in the Martin Marprelate controversy, and incurred the enmity of Gabriel Harvey, who described him in *Pierce's Supercroption* (1593) as 'a mad lad as ever twanged, never troubled with any substance of witt or circumstance of honestie, sometime the fiddle-sticke of Oxford, now the very bable (hauble) of London.' The authors of *Athenæ Cantabrigienses* (ii. 326) state that he was returned for Aylesbury to the parliament of 19th February 1592-93; for Appleby, 24th October 1597; and again for Aylesbury, 7th October 1601. In December 1597 he addressed to Secretary Cecil a letter expressing disappointment at not obtaining advancement. From the register of St Bartholomew the Less, London, it appears that he was buried 30th November 1606. He was married, and had children, was short of stature, and very fond of tobacco.

Lyly's most famous work is his *Euphues*, a romance in two parts. The first part, *Euphues, the Anatomy of Wit* (4to), was published in the spring of 1579; the second part, *Euphues and his England*, followed in 1580. In court circles the romance was received with great applause. Edward Blount, the publisher, who collected Lyly's plays in 1632, declared: 'Our Nation are in his debt for a new English which hee taught them. . . . All our Ladies were then his Schollers; And that Beantie in Court which could not Parley Euphuesisme was as little regarded as shee which now there speaks not French.' In the *Monastery* Scott drew, in the person of Sir Piercy Shafton, the character of a euphuistic gallant; but the portrait is barely recognisable. One peculiarity of this 'new English' is the constant employment of similes drawn from fabulous stories (of classical and mediæval writers) concerning the properties of animals, plants, and minerals. Another is the excessive indulgence in antithesis. Lyly cannot relate the simplest incident without introducing antithetical flourishes and fetching illustrations from bestiaries and

herbals. This unnatural style of writing was not Lyly's invention, but was to a large extent modelled (as Professor Landmann has shown) on the example of the Spanish writer Guevara. Lord Berners and others had translated works of Guevara; but the Spaniard's claims were forgotten, and Lyly was regarded as the pattern of refinement. Greene, Lodge, and others set themselves to imitate *Euphues*, but their affectations were seldom so deliberately extravagant as Lyly's. Later the euphuistic style was held up to derision. Drayton speaks scornfully of

Lyly's writing then in use;
Talking of stones, stars, plants, of fishes, flies,
Playing with words and idle similes.

The matter of *Euphues* is more commendable than the manner. Sound advice is offered on the subject of friendship, love, travel, the nature and education of children, morality, and religion.

Lyly's comedies (which were performed before the queen by children's companies) are more readable than his romance. The earliest, as we learn from the prologue, was *The Woman in the Moone*, first printed in 1597, but produced in or before 1583. *Campaspe* and *Sappho and Phao* were published in 1584; *Endimion* in 1591; *Gallathea* and *Midas* in 1592; *Mother Bombe* in 1594; and *Love's Metamorphosis* in 1601. With the exception of *The Woman in the Moone*, these comedies (on pastoral and mythological subjects) were written in prose. Though they display little dramatic power, they are fanciful and attractive entertainments. Frequently the dialogue is pointed and sparkling. The delightful songs were first printed in the collective edition of 1632: 'Cupid and my Campaspe played' is in modern anthologies.

Lyly's plays were edited by Fairholt in 1858; *Euphues* by Arber (1868); the *Endimion* by Mr G. T. Baker (1895). See C. G. Child's *Lyly and Euphuism* (1894).

Lyme Regis, a seaport and watering-place of Dorsetshire, at the mouth of the Lyme rivulet, 5 miles SE. of Axminster and 23 W. of Dorchester. The Cobb breakwater, dating from the 14th century, was reconstructed by government in 1825-26. Chartered by Edward I., and incorporated by Elizabeth, Lyme returned two members till 1832, and then one till 1868. It beat off Prince Maurice (1644), and was Monmouth's landing-place (1685). Natives have been Sir George Somers, Captain Coram, and Miss Mary Anning, the discoverer of the Ichthyosaurus and Plesiosaurus in the Lias rocks here, which are largely quarried. Pop. (1851) 2361; (1881) 2047; (1891) 2365. See Roberts' *History of Lyme Regis* (1834).

Lymington, a municipal borough of Hampshire, at the mouth of the Lymington River in the Solent, 12 miles (by a branch-line 18) SW. of Southampton. The salt works belong to the past; and yacht-building is now the principal industry. Lymington is also of some importance as a watering-place. It commands fine prospects of the Isle of Wight, and its vicinity abounds in charming scenery. Till 1867 it returned two members to parliament, and then till 1885 one. Pop. (1851) 2651; (1881), with extended area, 4551. See works by Garrow (1825), Grove (1835), and King (1879).

Lymph (Gr. *lymphā*, 'water') is the term applied by physiologists to the fluid contained in the Lymphatics (q.v.). It is a colourless or faintly yellowish fluid, of a rather saltish taste, and with an alkaline reaction. It coagulates shortly after its removal from the living body, and forms a jelly like, semi solid mass, which continues for some time to contract, so that at last the clot is very small in proportion to the expressed serum. On microscopic examination the lymph is seen to contain corpuscles which do not in any respect

differ from the colourless blood-cells, molecular granules, fat-globules, and occasionally blood-corpuscles.

Lymphatics arise in the form of a network of lymph capillaries which lie in the minute inter-cellular spaces of the body, and in addition form

Diagram of Lymphatic System:

a, small artery or capillary from which lymph (blood-plasma) exudes; b, cell bathed by lymph; c, small lymphatic into which lymph collects; d, lymphatic gland; e, vein into which the lymph is returned.

large lymph cavities, such as the peritoneal, pleural, &c. The lymph is then conveyed by larger and larger vessels, to the venous system, on entering which it mixes with the blood. The lymph of the left side of the trunk, of both legs, of the left arm, and the whole of the chyle is conveyed into the blood by the thoracic duct; while the lymph of the right side of the head, neck, and trunk, and of the right arm, enters the circulation at the junction of the axillary and internal jugular veins on the right side by a short trunk, guarded at its opening by valves. On its way the lymph passes through small glands of the size of a pea or bean called lymphatic glands. Thus, those of the arm pass through the lymphatic glands of the axilla, those of the leg through the glands of the groin, and those of the head and face through the glands of the neck.

The lymph arises primarily from the fluid part of the blood which exudes from the capillaries, bathes the cells and tissues of the body, and then, after supplying them with food and receiving their excretions, passes on once more to enter the circulation, being carried there by the lymphatic vessels. The corpuscular elements are chiefly the products of the lymphatic glands. See CHYLE. CIRCULATION.

Lynchburg, a city of Virginia, lies in a picturesque mountain-region, on the James River, which is here spanned by several bridges, 124 miles by rail W. by S. of Richmond. It is a thriving place, with the electric light and electric trams, and has several foundries, a cotton-mill, a fruit-canning factory, and manufactories of nails, farming implements, fertilisers, and furniture, besides tobacco, which is the staple of the town's trade. There are twenty-four leaf-tobacco factories, and an even larger number of others. Pop. (1880) 15,959; (1890) 19,709.

Lynch Law, the summary trial and punishment of offenders by private and unauthorised persons. This mode of administering justice has been necessarily employed in countries newly settled, where the power of the civil government is not yet sufficiently established. The frequency with which it has been resorted to in the southern and western states of the American Union, however, as a punishment for serious criminal offences, is to be referred rather to a doubt on the part of the mob as to the adequacy of the ordinary legal machinery. In the six years 1884-89 the number of murders in the United States was reported as 14,770, of legal executions 558, and of lynchings 975. Of course, the infliction of any minor punishment without legal trial constitutes lynch law (see VIGILANCE SOCIETIES), but the simple term 'lynching' usually implies capital punishment. The phrase has been variously traced to a Virginia soldier and to a Virginia farmer of

that name, to one Lynch who was sent out from England about 1687 to suppress piracy, and to a mayor of Galway (q.v.) in Ireland; while yet another tradition refers it to Lynch Creek, in North Carolina, where the forms of a court-martial and execution were gone through over the lifeless body of a Tory, who had already been precipitately hanged to prevent a rescue.

Lyndhurst, a Hampshire village, the capital of the New Forest, 9 miles SW. of Southampton. Its church (1863) is a brick Early English-structure, with conspicuous spire, good stained glass, a monument by Flaxman, and a fresco by Leighton of the 'Ten Virgins.' Near it is the verderers' hall, with Rufus's stirrup. Pop. of parish, 1589.

Lyndhurst, JOHN SINGLETON COPLEY, BARON, thrice Lord Chancellor, was the son of J. S. Copley, R.A. (q.v.), and was born at Boston, Massachusetts, 21st May 1772. At three, with his mother, he followed the painter to London, where, from 1780 till his death, his home was at 25 George Street, Hanover Square; and, after a private education at Chiswick, in 1790 he entered Trinity College, Cambridge. In 1794 he came out second wrangler and second Smith's prizeman, next year got a fellowship, and in 1796 paid a six months' visit to the States, travelling through them with Volney. On his return to England he began to study for the bar, to which, however, he was not called till 1804, when he joined the Midland circuit. He worked assiduously, but success was 'very, very slow' till 1807, and not assured till 1812, when he made a real hit by his ingenious defence of a Luddite rioter. In 1817 he obtained the acquittal of Thistlewood and Dr Watson on their trial for high-treason; but for the next state prosecution, four months afterwards, the government secured him on their side, and in 1818 he entered parliament for a government borough. Henceforward, whatever his former politics, he continued a fairly consistent Tory, and as such his promotion was rapid. In 1819, as Sir John Copley, he became Solicitor-general, in 1824 Attorney-general, and in 1826 Master of the Rolls. When Canning was charged to form a ministry he offered the Great Seal to Copley, who was raised to the Upper House as Baron Lyndhurst; he remained Lord Chancellor under three administrations from 1827 to 1830. At the close of the latter year his Whig opponents made him Chief-baron of the Exchequer, which office he exchanged for the wool-sack during Peel's brief administration (1834-35). He next led the opposition in the Upper House to the Melbourne ministry, his annual reviews of the session doing much to reanimate his party and pave the way for its return to power in 1841. He then for the third time became Lord Chancellor, and held the Great Seal till the defeat of the Peel government in 1846. After that time he took little part in home politics, but his voice was often heard on matters of foreign policy. Threatened with blindness for the last fourteen years of his life, he died 12th October 1863, at the great age of ninety-one. Lyndhurst's attainments as a clear-headed lawyer have never been questioned; his judgments— that, for instance, in the great case of *Small v. Atwood* (1832)—have never been excelled for lucidity, method, and legal acumen. In the House of Peers he had not his equal as a debater. Still, he was not a great statesman, lawgiver, or orator, mainly perhaps through lack of earnestness. His character has been blackened by Lord Campbell (*Lives of the Chancellors*, vol. viii. 1869), and enlarged by Sir Theodore Martin (*Life of Lord Lyndhurst*, 1883). For the act that goes by his name, see DECEASED WIFE'S SISTER.

Lyndsay, or LINDSAY, SIR DAVID, OF THE MOUNT, one of the best, and long the most popular of the older Scottish poets, was the son of David Lyndsay of Garmilton (now Garleton), in East Lothian, whose grandfather was a son of Sir William Lyndsay of the Byres. The poet is said by Chalmers to have been born at the Mount about the year 1490, but Laing in his recent edition of Lyndsay (1879) notes the absence of evidence on this point, Chalmers having apparently assumed it as a consequence of his supposition that the poet's father was 'David Lyndsay of the Mount', while Laing has shown that this was the poet's grandfather. The name of 'Da. Lindsay' occurs in the list of 'incorporated' students in St Salvador's College, St Andrews, for the year 1508 or 1509. It may be that of the poet. We cannot tell when he entered the royal service, but in October 1511 he is found taking part in a play acted before the court of James IV. In the following spring he was appointed 'keeper' or 'usher' of the prince who, when little more than a twelvemonth old, became James V.; and his verses preserve some pleasing traces of the care and affection with which he tended the king's infant years. His wife, Janet Douglas, had long the charge of the royal apparel. In 1524 the court fell under the power of the queen-mother and the Douglasses, and Lyndsay lost his place; but four years afterwards, when the Douglasses were overthrown, Lyndsay was made Lyon King-of-arms, and at the same time received the honour of knighthood. In this capacity he accompanied embassies to the courts of England, France, Spain, and Denmark. He appears to have represented Cupar in the parliaments of 1542 and 1543; and he was present at St Andrews in 1547 when the followers of the reformed faith called Knox to take upon himself the office of a public preacher. He died childless before the summer of 1555.

Two editions of Lyndsay's poems were published in France in 1558; and these editions, with a few pieces added, were republished by Charteris, an Edinburgh bookseller, in 1568. Numerous editions appeared subsequently, indicating the great popularity which Lyndsay long enjoyed. For fully two centuries, indeed, he was what Burns has since become—the poet of the Scottish people. His works were in almost every house, his verses on almost every tongue. Like Burns, he owed part of his popularity no doubt to his complete mastery of the popular speech. But, like Burns, Lyndsay would have been read in whatever language he chose to write. His verses show few marks of the highest poetical power, but their merits otherwise are great. Their fancy is scarcely less genial than their humour, and they are full of good sense, varied learning, and knowledge of the world. They are valuable now, if for nothing else than their vivid pictures of manners and feelings. In the poet's own day they served a political purpose, by preparing the way for the great revolution of the 16th century. It has been said that the verses of Lyndsay did more for the Reformation in Scotland than all the sermons of Knox. Like Burns, Lyndsay shot some of his sharpest shafts at the clergy. The licentiousness that characterises his verse must be attributed in part to the age in which he lived. The earliest and most poetical of his writings is *The Dreme*; the most ambitious, *The Monarchie*; the most remarkable in his own day, perhaps, was *The Satyre of the Three Estaites*; but that which is now read with most pleasure, both for the charm of its subject and for its freedom from the allegorical fashion of the time, is *The Hystorie of Spenser Mallevan*. A good edition of Lyndsay's works is that of Chalmers (3 vols. Lond. 1806); but in points of detail it is less

accurate than that of David Laing (3 vols. 1879). A number of his poems have been edited by J. Small and F. Hall for the Early English Text Society (4 parts, 1865-71); and the Scottish Text Society have undertaken a new edition.

Lyndsay of Pitcottie. See PITSCOTTIE.

Lynedoch, THOMAS GRAHAM, LORD, British general, was the son of the laird of Balgowan in Perthshire, and was born on 19th October 1748. He raised in 1793 the 90th regiment of foot, and with it served at Quiberon and Isle Dieu. He distinguished himself at the capture of Minorca (1798), conducted the siege of Valletta (Malta), which capitulated (1800) just after he was superseded in the command, took part in the retreat to Corunna and in the Walcheren expedition (1809), at Barrosa, near Cadiz, gained a splendid victory over the French (1811), and then under Wellington distinguished himself at the siege of Ciudad Rodrigo (1812), was present at Badajoz and Salamanca, commanded the left wing at Vittoria (1813), captured Tolosa and St Sebastian, and, lastly, commanded a body of troops in Holland, with which he defeated the enemy at Merxem, but failed in an ill-advised attempt to storm Bergen-op-Zoom (1814). Three months later he was created Baron Lynedoch of Balgowan, and in 1821 was promoted to the rank of general. He was the founder of the Senior United Service Club in 1817. He died in London, 18th December 1843. See Lives by J. M. Graham (2d ed. 1877) and A. M. Delavoye (1880).

Lynn, or KING'S LYNN, a seaport, parliamentary and municipal borough of Norfolk, at the mouth of the Great Ouse, 48 miles WNW. from Norwich and 99 N. by E. from London. It still retains traces of the ramparts and a fosse, which once guarded it on the landward side, and abounds in picturesque old timbered houses, ornamented with carved work. Of its four churches the principal are cruciform St Margaret's, varying in style from Norman to Perpendicular, and 240 feet long, with two towers, one of which till 1741 was surmounted by a spire 258 feet high—and St Nicholas (1146-74), with a modern spire (1869), which replaced one blown down in the same hurricane as that of St Margaret's. Other features of interest include the Red Mount Chapel, octagonal, noticeable for its richly-ornamented roof; the hexagonal tower of the Grey Friars; a grammar-school, founded in or before the reign of Henry VIII, at which Eugene Aram was once usher; a guildhall, in which is preserved the Red Register of Lynn, one of the earliest paper books in existence; custom-house (1683); hospital (1834-47); museum (1854), with a good collection of British birds; library (1883); and two extensive docks (1869-84), admitting vessels drawing 22 feet at spring-tides. A considerable trade is carried on in corn, oil cake, coals, and timber, and large numbers of shrimps are caught and sent to London; but the imports of port wine, for which Lynn was formerly noted, have of late years much fallen off. In Edward I.'s reign it was one of the principal ports of the kingdom; in 1397 it ranked fifth amongst the towns contributing 'loans' to meet the royal necessities; in 1474 the Hanse merchants had a factory or 'steelyard' here; and in the first half of the 16th century it was a flourishing seat of cloth manufacture. In 1549, during Ket's (q.v.) rebellion, one body of the insurgents was encamped here, and in 1643, during the Civil War, the town capitulated to the parliamentary force after three weeks' resistance. King John (who in 1204 granted the town its first charter), the dowager queen Isabel (a resident for twenty-eight years at Castle Rising, a few miles distant), Edward III., Henry

VI., Edward IV., Henry VII., and Oliver Cromwell all visited Lynn, which was the birthplace of John Capgrave the chronicler and of Bishop Keene; and the residence of the physician Sir William Browne, and of Dr Charles Burney. Pop. (1801) 10,096; (1891) 18,360. At Sandringham, 7½ miles N. by E. of Lynn, is a residence of the Prince of Wales, the house, completed in 1870, being in the Elizabethan style of architecture. See Richards' *History of Lynn* (2 vols. 1812).

Lynn, a city and port of Massachusetts, on Massachusetts Bay, 10 miles NNE. of Boston, with which it is connected by train and tramway. Most of the houses are built of wood; among them are many handsome villas belonging to Boston merchants. The principal industry is the manufacture of ladies' and children's shoes—mainly for the West and South of which 10,000,000 pairs have been produced in one year. There are also large tanneries here. Though founded in 1629, Lynn became a city only in 1850. A great fire here in 1889 destroyed property worth \$5,000,000. Pop. (1880) 38,274; (1890) 55,727.

Lynton and Lynnmouth, two villages of North Devon, on the Bristol Channel, 18 miles NE. of Barnstaple by rail (1896), 17 E. of Ilfracombe, and 20 W. of Minehead. Lynnmouth stands close to the sea, and Lynton half-way up the cliff, 428 feet above. They were 'discovered' in 1883, and have since been developed, now possessing a cliff-railway 1000 feet in vertical ascent, electric light, nine hotels, &c. Shelley stayed at Lynnmouth in 1812; and Southey called it 'the finest spot, except Cintra and Arrabida [near Lisbon], that I ever saw.' Joint population (1881) 1212; (1890) 2300.

LYNX, a genus of Felidae, having a less elongated form than many others of that family, the body elevated at the haunches, long fur, a short tail, and the ears tipped with tufts or pencils of hairs.

The European Lynx (*Lynx virgatus*).

They are less courageous than other Felidae of similar size, and prey on small quadrupeds and birds. It has been said that they kill and devour the skunk. In pursuit of birds they climb trees. They are generally of a sullen and suspicious temper, and not easily tamed. The species are not numerous, but widely distributed; the distinctions of species and varieties are somewhat uncertain. The European Lynx (*L. virgatus*) is common in many parts of Europe and Asia, chiefly in mountainous and wooded districts. Its colour is variable, but generally of a dark reddish gray, spotted with reddish brown, the belly whitish. It is about three feet long, and proverbial for acuteness of sight. It is hunted in winter for its fur, which is always in demand in the market; but many of the lynx skins imported from the north of Asia

probably belong to other species. Those of North America, and probably also many of those of the north of Europe and of Asia, are the skins of the Canada Lynx (*L. canadensis* or *L. borealis*), which is generally of a hoary gray colour, a broad space along the back being blackish brown. It is rather larger than the European Lynx, and more clumsy in form. The Bay Lynx (*L. rufus*) is found in more southern parts of North America, both in mountainous and in swampy districts, and often makes great havoc among poultry; it is commonly called in America the wild cat. But as all these forms graduate into one another they should probably be referred to a single species. The Asiatic species are the Caracal and the Tibet Lynx.

Lyon Court, the court in Scotland which has jurisdiction in questions regarding coat-armour and precedence. It is presided over by the Lyon King-of-arms. See HERALD.

Lyonnesse. See CORNWALL.

Lyonnais, a former province of France, was bounded on the W. by Auvergne and on the S. by Languedoc. Its territory coincides nearly with the present departments of Rhone, Loire, Haute-Loire, and Puy-de-Dome.

Lyons (Fr. *Lyon*), the second city of France, stands at the confluence of the Rhone and the Saône, by rail 315 miles SSE. of Paris and 218 N. by W. of Marseilles. The commercial and fashionable quarters of the city lie on the long narrow tongue of land between the rivers, and are connected with the suburbs beyond by more than twenty bridges. This central part of Lyons contains many narrow streets, with tall gloomy houses; but much has been done to lighten it since 1852 by the making of long straight, wide streets, and the opening up of squares. In this district stand the museum (1667), with valuable Roman antiquities, a library of 120,000 vols. and 1500 MSS., pictures by the great masters, and other art collections; the church of St Martin d'Ainay, the oldest in Lyons, going back to the 10th century; St Nizier Church, at first the cathedral, a fine 15th-century Flamboyant building, with the crypt in which St Pothimus is said to have officiated; the graceful town-house, built in 1646 and restored in 1702; the museum of arts and industry; the academy, with five faculties; the hospital, founded in the 6th century, and perhaps the oldest in France, though the present building dates only from 1773; and the arsenal. To the north lies the suburb of La Croix Ronsee, where the silk weavers dwell. Across the Saône, and on its right bank, is the steep, high suburb of Fourvières, the ancient *Forum Vetus* of Trajan, whose summit (410 feet) is now crowned by the church of Notre Dame (the new church begun in 1872). Here is the miracle-working image of our Lady of Fourvières that is believed to have preserved the city from the cholera in 1832, 1835, and 1850; it is visited by thousands of pilgrims annually, whose offerings cover the walls of the church. From its tower, which is surmounted by a gilded statue of the Virgin, 48 feet high, a view can be had of the distant Alps. On this elevated site too stands the church of St Irenæus, in the crypt of which are preserved what purport to be the bones of 19,000 Christian martyrs who perished in the persecution by Severus. At the foot of the hill next the Saône is the archiepiscopal cathedral of St John, of the 13th and 14th centuries, with magnificent stained glass windows of the same date and a celebrated cloek of 1598; the palace of the archbishop, who ranks as primate of France; and the law-courts. On the left bank of the Rhone, which is so low that it has to be protected with embankments to prevent it from overflowing and flooding the city, is the handsome new suburb of Les Brotteaux, termin-

ated on the north by the park of the Tête d'Or, in which are an oriental museum, a zoological collection, and a fine botanical garden; while more to the south is the squalid suburb of La Guillotière. Lyons possesses also a Roman Catholic University with three faculties, a first-class veterinary school, a school of art with 1200 pupils, of great value for the silk manufactures, a school of the industrial arts, a municipal library of 66,000 vols., a natural history and other museums, and a silk-conditioning house. The city is a fortress of the first rank, being defended by a double ring of forts. Pop. (1872) 301,868; (1891) 398,927, or, of the commune, 438,977. The staple industry is the silk; it is computed that there are in all, within the city and its environs, from 75,000 to 85,000 hand-loom and 20,000 power-loom employed in this manufacture. Raw silk is imported, principally from China (28 per cent.), Japan (24 per cent.), Italy and the Levant, and France, to the annual value of £2,124,650, and manufactured silk goods exported to the yearly value of £9,510,960; the annual production reaches in value £43,936,000. The commodities specially characteristic of the Lyons manufacture used to be heavy figured stuffs, such as velvets, satins, watered silks, plushes, moirés, and so forth; but of late years, owing to a change in taste or fashion, there has been a growing demand for lighter stuffs dyed in the piece. Silk-dyeing and printing give employment to nearly 4000 workmen; 25,000 more are engaged in the various chemical industries (dyes, starch, candles, soap), machinery-making establishments, foundries, brass-works, fancy-ware manufactories, gold and silver goods, hats, paper, mathematical instruments, and numerous minor branches. The admirable position of Lyons makes it a great emporium of trade between central and southern Europe. Besides importing silk raw and exporting it manufactured, chiefly to Great Britain and the United States, cotton is imported from America and Egypt, and a large amount of business done in cloth and linen, chestnuts, coal, charcoal, cheese, and wine and spirits. The list of notable persons born in Lyons includes Germanicus and the Roman emperors Claudius, Marcus Aurelius, and Caracalla, Jules Favre, Roland, Say, Suchet, the De Jussieus, Ampère, Recamier, Bonnet, Delorme, Meissonier, and Jacquard.

The Romans settled a colony here in 43 B.C. and made it the starting-point for their great network of highways through Gaul. It soon became the ecclesiastical metropolis of that great province and its first commercial and manufacturing town, under the name of Lugdunum. But ill fortune attended it: it was burned to the ground in 59 A.D., and again in 197; it suffered severely during the barbarian invasions; and was conquered by the Saracens in 736. Yet it was visited by gleams of glory: in 478 it was made capital of the Burgundian kingdom, and, passing to the empire in 1032, was invested with self-government and the privileges of a free imperial town. But after the condemnation of the Emperor Frederick II. at the Council of Lyons in 1245 the city reverted to the French crown. The introduction of the silk industry must be set down to the credit of Francis I. The Reformation, entering from Geneva, had a short but violent reign; the emigration of the Huguenots struck a blow at the industrial prosperity of the town from which it did not recover for some time. In 1789 the city embraced the cause of the Revolution, though royalist feeling was also strong here. In 1792 it refused obedience to the National Convention; in revenge it was besieged, captured, its buildings destroyed, its name changed (till 1794) to Ville-Afranchie, and 6000 of its citizens slain under the direction of Collot d'Herbois,

Couthon, and Fouché. The 19th century was chiefly memorable for trade riots, which sometimes, as in 1831, 1834, and 1849, assumed very formidable dimensions. Since the war of 1870 it has been known as a focus of red republicanism.

See Histories by Clerjon (4 vols. 1829-35), Beaulieu (1838), Monfalcon (8 vols. 1806-70), Metzger (9 vols. 1881-85), the topographical account by Joanne (1885), and works by Josse (1892) and Steycers (1895).

Lyre, one of the oldest forms of stringed instrument. It was introduced into Egypt from Palestine during the 18th dynasty, and was common among the Greeks even in the heroic times. Most of the barbarians who invaded the Roman empire were acquainted with the lyre, and must have independently attained the knowledge of it. The common Greek lyre was made of a tortoise-shell, with blocks inside, similar to those used in a violin, to modify the strain of the strings. The shell was covered with bull's hide, and two horns were fastened to one side of it, one horn at each extremity of the side. A piece of wood served as a crosspiece, and was fastened from the tip of one horn to the tip of the other. Seven strings of gut were tied to the crosspiece, the other ends being secured at the bottom of the shell. Pegs for the strings were added to the crosspiece by the later Greeks, likewise a bridge to prevent the strings touching the shell, and two sound-holes cut in the shell in order to increase its resonance. The lyre, unlike the lute, cannot be stopped by the fingers and its sounds thereby multiplied. Its sounds can be no more in number than its strings. Consequently, since the rise of the modern scale, the lyre, whose strings were never more than seven or eight in number, has been unable to cope with the growing exigencies of an intricate music, and has fallen into complete desuetude.

Lyre-bird, or LYRE-TAIL (*Menura*), a genus of birds, of which the best-known species (*M. superba*) is a native of New South Wales, where it is generally called the Lyre Pheasant. The proper place of this genus has been much disputed by ornithologists, though it undoubtedly belongs to the Passeres. A bird about the size of a pheasant, it frequents the brush, or sparsely-wooded country, in the unsettled parts of New South Wales, but retreats from the more inhabited districts, being extremely shy and difficult to approach. It is by far the largest of all song birds, and possesses the power of imitating the song of other birds and the sounds of other animals, imitating even the bark of the dingo. The tail of the male is very remarkable and splendid, twelve feathers being very long, and having very fine and widely-separated barbs; whilst, besides these, there are two long middle feathers, each

Lyre-bird (*Menura superba*).

of which has a vane only on one side, and two exterior feathers, curved like the sides of an ancient lyre. The lyre-bird makes a domed nest. A second species (*M. alberti*), also Australian, has been named in honour of Prince Albert. The lyre-shaped feathers of its tail are comparatively short and destitute of bars.

Lyric, the name given to a certain species of poetry because originally accompanied by the music of the lyre. It is rapid in movement, as befitting the expression of the mind in its emotional and impassioned moments, and naturally its principal themes are love, devotion, patriotism, friendship, and the Bacchanalian spirit. It was a favourite form among the ancient Greeks and Romans, and here it may be enough to mention the names of such masters as Sappho, Pindar, Tyrtaeus, Simonides, of many unknown writers in the *Greek Anthology*, and of Catullus and Horace. The most important form of the modern lyric is the *song*, with its religious sister, the *hymn*, neither of which, as we might expect, extends usually to any great number of lines. Lyric poetry obviously concerns itself with the thoughts and emotions of the writer's own mind, and is thus *subjective* as opposed to the epic, for example, which is essentially *objective* in character; while from beginning to end it should express but one incident, situation, or spasm of emotion. Modern English literature is remarkably rich in poetry in lyric forms, although it would be difficult to bring together any three of their contemporaries to outweigh Goethe, Schiller, and Heine. As admirable examples of devotional lyrics may be named Milton's 'Christmas Ode,' Byron's *Hebrew Melodies*, Moore's *Sacred Melodies*, and our thousand hymns of greater or less poetic value; of love-songs, the masterpieces of Herrick and other Caroline lyricists, and of Burns, the best dozen of whose songs stand safely first in their order, as well as, in later times, the unmatched utterances in Tennyson's *Maud* of the love-passion in its swift progress from hope to despair; of loyal, and patriotic, and martial lyrics, the Royalist, and especially the Jacobite group, Campbell's 'Ye Mariners of England,' 'Hohenlinden,' and 'The Battle of the Baltic,' Burns's 'Scots wha hae,' Byron's 'Isles of Greece,' and Tennyson's 'Charge of the Light Brigade' and 'The Last Fight of the Revenge.' An admirable selection from the whole range of English poetry is Palgrave's *Golden Treasury* (1861, often reprinted). See **SONG**.

Lys, or **LEYE**, a tributary of the Scheldt, rises in France near the little town of Lysbourg, in the department of Pas-de-Calais, and flows in a north-eastern direction, joining the Scheldt at Ghent in Belgium after a course of 130 miles.

Lysander, a famous Spartan warrior and naval commander, of extraordinary energy and military skill, but not less remarkable for the cunning, revenge, and ambition by which he was characterised. He spent part of his youth at the court of Cyrus the Younger, and in 407 B.C. was appointed to the command of the Spartan fleet, from which time he constantly prosecuted the design of overthrowing the Athenian power, in order to exalt that of Sparta. He defeated the Athenian fleet at the promontory of Notium; and, being again entrusted with the management of the fleet after the defeat of his successor, Callieratidas (405 B.C.), he was again victorious. He swept the southern part of the Ægean, and made descents upon both the Greek and the Asiatic coasts. He then sailed north to the Hellespont, and anchored at Lampsaenus. An immense Athenian fleet soon made its appearance at Egospotami, on the opposite side of the straits, amounting to 180 ships. Of these, 171 were captured by Lysander a few

days after. The blow to Athens was tremendous. Everywhere her colonial garrisons had to surrender, and Spartan influence predominated. Finally, in 404 B.C., he took Athens itself. His popularity now became so great, especially in the cities of Asia Minor, that the Spartan ephors dreaded the consequences, especially as they knew how ambitious he was. Every means was taken to thwart his designs, until finally it would appear that he had resolved to attempt the overthrow of the Spartan constitution; but this scheme was prevented by his death at the battle of Haliartus in the Boeotian war (395 B.C.). His life was written by Plutarch and by Cornelius Nepos.

Lysias, the first Greek orator who attained perfection in his own line, was the son of Cephalus, who, foreigner though he was—he came from Syracuse—succeeded in making his house one of the centres of intellectual life in Athens. Lysias himself was born in Athens, probably about 432 B.C. (the date is very uncertain), was educated along with children of the best Athenian families, and at fifteen years of age joined the colony planted by Athens at Thurii, where his early manhood was spent. The failure of the Athenian expedition against Sicily made it advisable for Lysias, like other friends of Athens, to leave Thurii, and in 412 he returned to Athens and continued his rhetorical studies, not for professional purposes, for he and his brother Polemarchus were wealthy, but from choice. The choice proved in the event a wise one, for the Thirty Tyrants, in 404 B.C., stripped the brothers of all their wealth, killed Polemarchus, and only failed to kill Lysias because he fled to Megara. The first practical use to which Lysias put his eloquence was, on the fall of the Thirty (403), to avenge his brother's death by prosecuting Eratosthenes, the tyrant on whom the principal responsibility for the legal murder of Polemarchus rested. He then practised, until his death at the age of eighty, with singular success as a writer of speeches for persons engaged in litigation. According to Dionysius of Halicarnassus, he composed 233 such speeches, and only failed in two instances to secure a favourable verdict. From an examination of the thirty-four surviving speeches, we can see that Lysias is at all times and in all matters surprisingly and delightfully lucid in both thought and expression; he rarely indulges in a metaphor, he is always direct, and uses simple, commonplace language for his simple narrative and common-sense arguments. But though simple his narrative is never monotonous; it is lively, graceful, and entertaining. Another quality, which both contributed to his practical success and helps to place his speeches amongst the most entertaining of Greek literature, is his power of character drawing.

The first edition is Aldus' (1513); the best edition of the text, Teubner's; a school edition, Cobet's (Amst. 1863). Selections, with German notes by Frobergger and Rauchenstein. See Jebb's *Attic Orators*; and Blass, *Die Attische Beredsamkeit*.

Lyte, HENRY FRANCIS, hymn-writer, born at Ednam, near Kelso, 1st June 1793; in 1812 entered Trinity College, Dublin; took orders in 1815; and, his health having failed three years earlier, died at Nice, 20th Nov. 1847. His *Poems, chiefly Religious* (1833; reprinted as *Miscellaneous Poems*, 1868), *Memoir of Henry Vaughan* (1847), &c., are almost forgotten; but 'Abide with me,' 'Pleasant are thy courts,' and other hymns keep his memory green. See Life prefixed to his *Remains* (1850).

Lytham, a watering-place of Lancashire, on the north shore of the Ribbles estuary, 14 miles W. of Preston, and 7 S.S.E. of Blackpool. Pop. 4122.

Lythraceæ, a natural order of exogenous plants, chiefly herbs, and rarely shrubs or trees.

The order contains about 40 genera and upwards of 300 species, chiefly natives of the tropics; but a few are found in Europe and in North America. Astringent qualities are ascribed to some of the species. The order is well represented in Britain by the well-known Loosestrife (*Lythrum salicaria*), which grows abundantly on the margins of ponds and streams and in moist meadows, in some parts of the country imparting character to the landscape by its broad masses of purple flowers. The Henna (q.v.) of Egypt is produced by *Lawsonia inermis*, a plant of this order. The leaves of another (*Pemphis acida*) are said to be a common potherb on the coasts of the tropical parts of Asia. The leaves of *Annonia resinifera*, an East Indian aquatic plant, are very acrid, and are sometimes used as blisters. *Physalium floribunda*, a Brazilian tree of this order, growing about 30 feet high, furnishes the valuable rosewood (the American tulipwood) of commerce.

Lyttelton, GEORGE, LORD, son of Sir Thomas Lyttelton of Hagley, in Worcestershire, was born in 1709, and educated at Eton and Christ Church, Oxford. He entered parliament in 1730, where he soon acquired eminence as a speaker, held several high political offices, was raised to the peerage in 1759, and died 22d August 1773. Lyttelton had once a considerable reputation as an author, and his poetry gained him a place in Johnson's *Lives of the Poets*. His best-known prose works are *Observations on the Conversion and Apostleship of St Paul* (1747), *Dialogues of the Dead* (1760), and *History of Henry II.* (1764). See his *Memoirs and Correspondence* (2 vols. 1845).—His son, THOMAS, LORD LYTTELTON (1744–79), who was as conspicuous for profligacy as his father for virtue, died three days after a nocturnal warning by a dove and a white lily (Chambers's *Book of Days*, vol. ii. p. 625). The *Poems by a Young Nobleman* (1780) may partly at least have been his, but the *Letters of the late Lord Lyttelton* (2 vols. 1780–82) were probably by Combe ('Dr Syntax'). A *Quarterly* reviewer (1851) identified him with Junius.

Lyttelton, SIR THOMAS. See LITTLETON.

Lytton, EDWARD BULWER, LORD, novelist, playwright, essayist, poet, and politician, was born at 31 Baker Street, London, on 25th May 1803. He was the third and youngest son of General Earle Bulwer (1776–1807) of Heydon and Dalling in Norfolk, by Elizabeth Barbara Lytton (1773–1843), the heiress of Knebworth in Hertfordshire. As a child a devourer of books, his favourites *Annals de Gaul* and the *Fairy Queen*, he took early to rhyming, and went to school at nine, though not, it may be unluckily, to a public one, but to six private tutors in succession (1812–21). In 1820 he published *Essays and other Poems*, and about the same time was 'changed for life' by a hopeless, tragic first love. At Trinity Hall, Cambridge (1822–25), he read English history, political economy, metaphysics, and early English literature; spoke much at the Union; carried off the Chancellor's gold medal for a poem upon 'Sculpture,' but took only a pass degree. Meanwhile, in a long-vacation walking-tour (1824), he had visited the grave of his lost love in the Lake Country; and there, in Scotland, and in the north of England, had strange adventures with cut throats and most impossible Gypsies. Now, his college life ended, he alternated awhile between Paris and London; and in London, in December 1825, he met Rosina Wheeler (1802–82), a beautiful Irish girl, whom in August 1827, despite his mother, he married. It was a most unhappy marriage. She bore him a daughter, Emily (1828–48), and a son, the future Earl of Lytton; in 1836 they separated. But his marriage did this

for him: it called forth a marvellous literary activity, for the temporary estrangement from his mother threw him almost wholly on his own resources. He had only £200 a year, and he lived at the rate of £3000; the deficiency was supplied 'out of his well-stored portfolio, his teeming brain, and his indefatigable industry.' During the next ten years he produced twelve novels, two poems, one political pamphlet, one play, the whole of *England and the English*, three volumes of *Athena, its Rise and Fall*, of which only two ever were published, and all the essays and tales collected in the *Student*, to which must be added his untold contributions to the *Edinburgh*, the *Westminster*, the *New Monthly* (of which he became editor in 1831), the *Economist*, &c. His Wertherian *Falkland*, published anonymously in 1827, gave little promise of the brilliant success, both at home and abroad, of *Pelham* (1828), the clever persiflage of whose dandy hero is still delightful. No two readers agree on the relative merit of his books, but indeed this very divergency of opinion as to which is really his masterpiece only illustrates his amazing versatility. Certainly *Pelham* is better than *Paul Clifford* (1830), a marvellous idealisation of the highwayman, as *Eugene Aram* (1832) is of the murderer; but most will rank it as inferior to the exquisitely fanciful *Pilgrims of the Rhoe* (1834) or to one or another of his four splendid historical novels—*The Last Days of Pompeii* (1834), *Rienzi* (1835), *The Last of the Barons* (1843), and *Harold* (1843). Then, there is his domestic trilogy, *The Caxtons* (1850), *My Novel* (1853), and *What will he do with it?* (1859), Sterne-like, yet strangely un-Sterne-like, surpassing Thackeray for peasants and Dickens for gentlemen, and both in knowledge of the world of politics. Or there are *Zanoni* (1842), *A Strange Story* (1862), and, shorter but stronger than either, *The Haunted* and *The Hunters* (*Blackwood's Magazine*, 1859). No English story of the supernatural comes near to this, and why?—because he wrote here as a believer, as a serious student of astrology, chiromancy, occult lore generally. These books are triumphs in the art of fiction in its most widely differing divisions, and taken together, display an unexampled range of powers. Here the reader finds at once vast knowledge, rich suggestiveness welded to profundity of thought, fresh insight into perplexing psychological and social problems, breadth of view, wit in richer measure than humour, together with an unusual power of handling vivid incident and a rare mastery of plot-construction.

Of his plays it must suffice to say that the *Lady of Lyons* (1838), *Richelieu* (1838), and *Money* (1840), all three of which owed something to hints from Maeready, still hold the stage as firmly as the masterpieces of Goldsmith and Sheridan; of his poems that *King Arthur* (1848), and even *St Stephens* (1860) and the *Last Tab of Miltus* (1866), will all be forgotten when the *New Timon* (1846) is still kept in remembrance by the savage answer it provoked from Tennyson.

In 1831, at the age of twenty-eight, he had entered parliament as member for St Ives, and attached himself to the Reform party; but Lincoln next year returned him as a Protectionist Liberal, and that seat he held till 1841. In 1838 the Melbourne administration conferred on him a baronetcy for his brilliant services as a pamphleteer; in Dec. 1843 he succeeded, by his mother's death, to the Knebworth estate, and assumed the additional surname of Lytton. He now sought to re-enter parliament, in 1847 contesting Lincoln unsuccessfully; and in 1852 he was returned as Conservative member for Hertfordshire. Deafness hindered him from shining as a debater, but he made himself a successful orator. In the Derby

government (1858-59) he was Colonial Secretary, and signalised his brief tenure of office by calling into existence the two vast colonies of British Columbia and Queensland. In 1866 he was raised to the peerage as Baron Lytton. He died at Torquay on 18th January 1873, and was buried in Westminster Abbey.

Lord Lytton's works in all exceed sixty, and fill more than 110 volumes. To those already mentioned may be added *The Disowned* (1829), *Deveraux* (1829), *Godolphin* (1833), *Ernest Maltravers* (1837), *Alice* (1837), *Lilla and Calderon* (1838), *Night and Morning* (1841), *Poems and Ballads, chiefly from Schiller* (1844), *Lucretia* (1846), *Caetoniana* (1863), *The Coming Race* (anonymously, 1870), *Kentia Chillingly* (1873), *The Parisians* (1874), and *Pausanias the Spartan* (unfinished, 1876). The *Life, Letters, and Literary Remains of Lord Lytton* (vols. i. ii. 1883), by his son, comes down only to 1832, so must be supplemented by the political Memoir, also by the Earl of Lytton, prefixed to the *Speeches of Lord Lytton* (2 vols. 1874).

Lytton, EDWARD ROBERT, EARL OF, poet, diplomatist, and statesman, was born in Hertford Street, London, 8th November 1831, and was educated at Harrow and at Bonn. In 1849 he went to Washington as an attaché and private secretary to his uncle, Sir Henry Bulwer (q.v.); and subsequently he was appointed attaché, secretary of legation, consul or *chargé d'affaires* at Florence

(1852), Paris (1854), The Hague (1856), St Petersburg and Constantinople (1858), Vienna (1859), Belgrade (1860), Constantinople again (1863), Athens (1864), Lisbon (1865), Madrid (1868), Vienna again (1869), and Paris (1873). In that last year he succeeded his father as second Lord Lytton, and in 1874 became minister at Lisbon, in 1876 Viceroy of India, at the same time receiving the Grand Cross of the Bath. The chief events of his viceroyalty were the proclamation of the Queen as Empress of India at the grand Delhi durbār on 1st January 1877, and the outbreak in 1879 of the tedious and unpopular Afghan war. In 1880, on the fall of the Beaconsfield government, he resigned, and was made Earl of Lytton; in 1887 he was sent by Lord Salisbury as ambassador to Paris, and there he died 24th November 1891. His works, published mostly under the pseudonym of 'Owen Meredith,' include *Clytemnestra* (1855), a dramatic poem; *The Wanderer* (1859); *Lucile* (1860), a novel in verse; *Serbški pesme* (1861), translations from the Servian; *The Ring of Amasis* (1863), a prose romance; *Orral, or the Fool of Times* (1869); *Fables in Song* (1874); *Glenarvill* (2 vols. 1885), an epic of modern life; *After Paradise, or Legends of Esde* (1887); *Maanh* (1892); and *King Poppy* (1892). A selection from his Poems by Miss M. Betham-Edwards appeared in 1890.

M

the thirteenth letter in our alphabet, is ultimately derived from the hieroglyphic picture of an owl. In the capital letter M the two peaks are the lineal descendants of the two ears of the bird, retaining between them a not inapt representation of the beak, the first of the vertical strokes corresponding to the breast (see ALPHABET). In the script form *m* the central hanger represents the beak, on either side of which are two curves corresponding to the ears. When the symbol was taken over by the Phœnicians from the Egyptian hieratic the zigzags in the form *𐤎* were supposed to resemble ripples, and hence the letter received the name *mnm*, 'the waters,' and this name in the Greek alphabet became *mu*, owing probably to assonance with the name of the following letter *nu*. Our minuscule *m* is descended from the old Roman cursive, through the Irish semi-uncial and the Caroline minuscule.

The sound of *m* is defined as a labial of the nasal class; that is, if the vocal organs are placed in the position for pronouncing the labial *b*, and the breath is allowed to pass into the nose, the sound produced is that of *m*. Hence *a* has a great attraction for *b*, as in *lamb*, *nimble*, from A.S. *līm* and *nimol*, or in *umber*, from the Latin *numerus*. Sometimes *m* becomes *b*, as in *marble* from *marmor*. So also we find the two nasals, *m* and *n*, interchanging according to the nature of the contiguous consonants. Thus *n* changes to *m* before a labial, as in *imperator* for *inperator*, while *m* changes to *n* before gutturals and dentals, as in *conjure* and *concordia*, or in *ant* from O.E. *amete*, *ransom* from *reahmptionem*, and *count* from *computare*.

Maartens, MAARTEN, is the pen-name of J. M. M. van der Poorten-Schwarz, a Hollander, born in 1858, who, having spent part of his boyhood in England and been at school in Germany, was educated at a home university for law. He is known as the author of a series of powerful novels in nervous English, including *The Sin of Just Aveling* (1889), *A Question of Taste*, *God's Fool*, *The Greater Glory*, and *My Lady Nobody* (1895).

Maas. See MEUSE.

Maastricht. See MAESTRICHT.

Mab, 'the fairies' midwife,' who delivers men of dreams. Shelley in *Queen Mab* makes her queen of the fairies, a dignity really belonging to Titania, the wife of Oberon (q.v.). Mab's praises have been sung by Shakespeare, Ben Jonson, Herrick, Dryden, and other English poets.

Mabilion, JEAN, a learned Benedictine, born 23d November 1632, at St Pierre-mont, in Champagne. He studied at St Remy, in 1653 entered the Benedictine order, was placed in 1658 in the monastery at Corbie, in 1663 became keeper of the monuments at St Denis, and from 1664 worked, with stupendous erudition, in the abbey of St Germain des Prés at Paris. Here he died, 27th December 1707. He made many journeys into Germany and Italy for purposes of research. He aided

D'Achéry in the preparation of his vast historical collection, the *Spicilegium*; undertook an edition of the works of St Bernard (1667); and constructed a general history of his order, *Acta Sanctorum ordinis S. Benedicti in servitorum classis distributa* (9 vols. folio, 1668-1701). His classical work *De Re Diplomatica* appeared at Paris in 1681. Other works are *Œcœna Aulectæ* (1675-85), *Museum italicum* (1687-89), and *Annales ordinis S. Benedicti* (6 vols. folio, 1703-39). His posthumous works, including many letters, appeared at Paris (3 vols. 1724).

See Ruinart, *Vie de Jean Mabillon* (1709); Chavin de Malan, *Histoire de Dom Mabillon et de la Congrégation de Saint-Maur* (1843); Jadart, *Dom Jean Mabillon* (1879); and E. de Broglie, *Mabillon, 1664-1706* (1888).

Mabinogion. See HELGEST, and WALES.

Mablethorpe, a village on the coast of Lincolnshire, 13 miles by rail (1888) SE. of Louth, with hard and extensive sands, to which thousands of the working-classes of Leicestershire, Nottinghamshire, Derbyshire, Yorkshire, and Lancashire are carried every summer by cheap day-excursion trains. Close by is a submerged forest. Pop. 640.

Mably, GABRIEL BONNOT DE, elder brother of Condillæ (q.v.), born at Grenoble on 14th May 1709, studied at the Jesuit College in Lyons, and became secretary to the minister Cardinal Tencin, his uncle. But before many years had passed the two had quarrelled, and Mably gave himself up to a studious life. He died at Paris on 23d April 1785. He entertained a great admiration for the ancients, especially for the institutions of Sparta, and constantly illustrated his writings by the acts and lives of Solon, Phocion, Lycurgus, and Cato. In this department his chief books were *Entretiens de Phocion* (1763); *Parallèle des Romains et des François* (1740), in which the latter came off second best; and *Observations sur l'Histoire de la Grèce* (1766). His *De la Manière d'Ecrire l'Histoire* (1783) contains severe strictures on Hume, Robertson, Gibbon, Voltaire, and other historians. *Le Droit Public de l'Europe* (1748) was the outcome of his official life. See Guerrier, *L'Abbe de Mably* (1886).

Mabuse, JAN, whose real name was GOSSAERT, a Flemish painter, was born at Mauthouze (Mabuse) about 1470, and entered the painters' guild of St Luke at Antwerp in 1503. His life and work are divisible into two well marked sections. In the earlier portion, during which he dwelt mostly at Antwerp, his paintings—principally altarpieces—show that he studied Memling, Van der Weyden, and Quentin Matsys; their influence is especially apparent in an 'Adoration,' now at Castle Howard in Yorkshire, and in altarpieces at Seaway in England, and Tongerlo in Belgium. The most celebrated of his early pictures, a 'Descent from the Cross,' painted for the church of Middelburg in Holland, was burned in 1568. In 1508 Mabuse accompanied Philip of Burgundy to Italy, when he went to arrange the treaty of Cambrai. This set the fashion to subsequent Flemish painters of spending some time in the sunny, art-loving south. Mabuse returned home with his style greatly modified by the study of Leonardo, Michael Angelo, and Raphael; but the modification was

one that too often tended towards mannerisms, and to the introduction of contemporary portraits and details into religious pictures. After his return he resided chiefly at Wyck, Middelburg, and Antwerp, and died at the last named place on 1st October 1532. His later works embrace three classes—subjects from Greek mythology, as Neptune and Amphitrite, and Danae, characterised by strong traits of coarse realism; portraits, as of the children of King Christian II. of Denmark (about 1528), of a princess of Portugal, and of Jean Carondelet (1517); and religious subjects, including 'St Luke painting the Madonna,' 'Christ in Agony,' 'Adam and Eve,' and several Madonnas. Mabuse was a painstaking workman. Nearly all his pictures have rich architectural backgrounds, but the figures are stiff and stony; the colours are bright, sometimes gaudy.

Mac (contracted M'), a Gaelic prefix occurring frequently in Scottish names, as Macdonald, McLennan, and the like, meaning 'son.' It corresponds to the *son* in names of Teutonic origin, as Davidson; the *Fitz* in Norman names, as Fitzherbert; the Irish *O*, as in O'Connell; and the Welsh *Map*, shortened into 'ap' or 'p,' as Ap Richard, whence Prichard.

Macadam, JOHN LOUDON, inventor of the system of road-making known as 'macadamising,' the son of James MacAdam of Waterhead of Dugh, Kirkeudbright, was born at Ayr, 21st September 1756. He went to New York in 1770, entered his uncle's counting-house, became a successful merchant, and on his return to Scotland in 1783 bought the estate of Sauchie, Ayrshire. He began in 1810 to make experiments in the construction of roads, which became a passion with him, and in gaining experience he travelled 30,000 miles, and spent £3000. In 1816 he was appointed surveyor to the Bristol Turnpike Trust, and re-made the roads there cheaply and well. His advice and assistance were now sought in all directions, and his methods formed the subject of a select committee of the House of Commons in 1819. Instead of going deep for a 'bottoming,' he worked on the top; the road-metal, from 1 to 2 ounces in size, was scattered to a depth of from 6 to 10 inches, and when shaken and pressed together, made a top covering as close as a wall (see ROAD). Macadam, impoverished through his labours, petitioned parliament in 1820 for his expenses and some reward. His petition was repeated in 1823, and he was voted £10,000 and appointed Surveyor-general of Metropolitan Roads in 1827. He declined a knighthood. He died at Moffat, Dumfriesshire, 26th November 1836. He published *A Practical Essay on the Successful Repair and Preservation of Public Roads* (1819), *Remarks on the Present State of Road-making* (1820), and *Observations on Roads* (1822).

McAll Mission, the largest Protestant mission in France, was founded in 1871 by the Rev. Robert Whitaker McAll (born 1821, died 1893; see the *Life* published in 1896) and his wife. It now possesses more than 100 stations (some 40 in Paris), and is supported by Protestant Christians of all denominations in Britain and the British colonies, and the United States. Twelve years after its foundation, the mission held within the year 15,000 meetings, attended by close on a million of persons (mainly of the most neglected and irreligious classes), paid 20,000 house-to-house visits, and distributed more than 500,000 Bibles and tracts.

Macao, a Portuguese settlement on the south coast of China, on the west side of the estuary of the Canton River, Hong-kong being about 40 miles distant on the opposite side of the same estuary. The settlement occupies a small peninsula projecting from the south-eastern extremity of the island

of Hiang-shang, and is defended by forts built on the high ground overlooking the town. The islands Colovane and Taipa also belong to the settlement, whose total area is $4\frac{1}{2}$ sq. m. and pop. close upon 70,000, of whom less than 5000 are Portuguese, the rest being mostly Chinese. The principal public buildings are the cathedral and churches. Macao is one of the healthiest ports in China, though the heat is excessive during the south-west monsoon. The greater part of the revenue of the settlement is derived from licensed gambling-houses. The Portuguese obtained permission from the Chinese authorities to settle in Macao in 1557. The Chinese, however, until 1886 exacted from them an annual ground-rent, and retained jurisdiction over their own people. The anchorage of the port is defective; large vessels cannot approach nearer than six miles. Since the rise of Hong-kong the commerce of Macao has suffered severely. Shortly after it was declared a free port (1845) it became the headquarters of the coolie trade, especially with Peru and Cuba; but in consequence of fearful abuses the British and the Chinese constrained the Portuguese government to abolish the traffic in 1873 (see COOLIES). The trade of Macao (the name of which was for long a synonym for stagnation and decay) showed, in 1885-90, some signs of reviving. The import trade, mainly in the hands of Chinese and Parsees, had in 1889 a value of £755,057, the chief item being Patna opium; other imports are kerosene (formerly from America, now largely from Batavia), piece goods, yarn, and provisions. The exports, valued at £716,755 in 1889, comprise tea, oils, silk, and rice. The export of tea from Macao to London alone was 2,500,000 lb. British merchants have a share of the export trade, but not the Portuguese. Macao is the seat of a bishop and the headquarters of French missions in China. A grotto is shown here in which Camoens (q.v.) is traditionally believed to have written his *Lusiad* during his banishment.

Macaroni (originally lumps of paste and cheese squeezed up into balls; from Ital. *maciare*, 'to bruise or crush'), a peculiar manufacture of wheat which for a long time was confined to Italy, and, in fact, almost to Genoa; it is now, however, made all over Italy and at Marseilles and other places in the south of France. Strictly speaking, the name macaroni applies only to wheaten paste in the form of pipes, varying in diameter from an ordinary quill up to those now made of the diameter of an inch; but there is no real difference between it and the fine threadlike vermicelli, and the infinite variety of curious and elegant little forms which, under the name of *Italian pastes*, are used for soups. Only certain kinds of wheat are applicable to this manufacture, and these are the hard sorts which contain a large percentage of gluten. The wheat is first ground into a coarse meal, from which the bran is removed. This 'semola' is worked up into a dough with water; and for macaroni and vermicelli it is forced through gauges, with or without mandrels, as in wire and pipe drawing; or for *pastes* it is rolled out into very thin sheets, from which are stamped out the various forms of stars, rings, &c. Macaroni forms a large article of home consumption, and is exported to all parts of the world.

Macaronic Verse is properly a kind of humorous poetry, in which, along with Latin, words of other languages are introduced with Latin inflections and construction; though the name is sometimes applied to verses which are merely a mixture of Latin and the unadulterated vernacular of the author. Thus 'lassus kissare bonas' ('to kiss the bonnie lassies'), and 'burnantem extinguere thurstum,' are parts of macaronic hexameters.

Teofilo Folengo, called Merlinus Coccaius (1491-1554), a witty and graceless Benedictine, has been erroneously regarded as the inventor of macaronic poetry; but he was the first to employ the term in this sense. His *Macaronum* (1517) is a long satiric poem, in which Latin and Italian are mingled. A predecessor of his by half a century was Odassi or Odaxius of Padua. Good specimens are found in the *Mutule Imaginarie*, and in the *Epistole Obscurorum Virorum*. The *Polemio-Midlinia* (1683), ascribed to Drummond of Hawthornden, but rather by an obscure pamphleteer, Samuel Colvill (writing about 1680), is probably the best-known British example. Fortunately macaronic poetry has not been very extensively cultivated, although specimens of it may be found in the literature of almost all European countries.

See Genthe, *Geschichte der Macaronischen Poesie* (1829); Octave Délepière's *Macaroniana* (1852), and his *De la Littérature Macaronique* (1856); Morgan's *Macaronic Poetry* (New York, 1872); Brunet's *Littérature Macaronique* (1879); and Portior's *Opere Macaroniche di Merlino Coccaio* (3 vols. Mantua, 1882-89).

Macaroon (from the same root as Macaroni), a kind of biscuit made with the meal of sweet almonds instead of wheaten or other flour.

Macartney, GEORGE MACARTNEY, EARL, an administrator and diplomatist, was born of Scottish descent at Lissanore, near Belfast, Ireland, on 14th May 1737. On leaving Trinity College, Dublin, he entered (1759) the Inner Temple, London. As envoy-extraordinary to Russia, he concluded (1767) a commercial treaty; from 1769 to 1772 he was Chief-secretary of Ireland; and from 1775 to 1779 he was governor of Grenada, in the West Indies, but was compelled, after an honourable defence, to give up the island to Count D'Estaing, and was himself carried prisoner of war to France, though he soon contrived his exchange. The East India Company in December 1780 appointed him governor of Madras, and six years later promoted him to be governor-general; but his weak state of health obliged him to decline the honour. He had already had some experience as member of both the English and the Irish parliaments, and had been raised from a knight (created in 1764) to a baron in Ireland (1776). A duel with an officer named Stuart, whom he had expelled the service in India, brought him a severe wound shortly after his return home from India. The first diplomatic mission to China from Great Britain was headed by Macartney, now an Irish viscount, in 1792; before his return home he was made an Irish earl (1st March 1794). After undertaking a confidential mission to Italy (1795-96), he went out as governor of the new colony of the Cape of Good Hope (1796); but ill-health compelled him to return home in November 1798. Three years later he was offered a place in the Addington ministry, but he declined the honour. He died at Chiswick on 31st March 1806. In 1796 he was made Baron Macartney in the British peerage. See *Life*, prefixed to (Sir) J. Barrow's edition of his *Redeings* (1807).

Macassar, the most southern portion of Celebes, contains the chief town and port, Macassar, on the west coast of the southern peninsula, with a pop. of 20,000. See *CELLERES*.

Macaulay, THOMAS BABINGTON, LORD, one of the most popular and brilliant of British essayists and historians, was born at Rothley Temple, Leicestershire, 25th October 1800. He came of a Scottish Celtic family, several of whose representatives were ministers of the Church of Scotland. Two of them—Macaulay's grandfather, John Macaulay, who died minister of Cardross, and Kenneth, author of a history of St Kilda, came

into contact and collision with Samuel Johnson, when touring in the H-brides in the company of Boswell. Zachary Macaulay (1768-1838), the father of the future historian and politician, had a somewhat chequered career as an estate manager in Jamaica, but in the later years of his life was best known as an energetic and single-hearted member of the 'Clapham Sect' of philanthropists of which Wilberforce was the acknowledged head. He was married in Bristol in 1799 to Selina Mills, the daughter of a Bristol Quaker, and the pupil and friend of Hannah More. Macaulay was the first off-spring of this union, and was named after his father's brother-in-law. His earliest years were spent with his family in London. From infancy he showed that insatiable thirst for knowledge, that prodigious tenacity of memory, and that talent for phrase-making, which were subsequently to be the delight and the envy of his contemporaries. At the age of seven he wrote a compendium of Universal History and three cantos of the 'Battle of Cheviot' in imitation of Sir Walter Scott. His parents while noting marks of uncommon genius in their son, and encouraging him in every way, never flattered him or paraded him before others as a prodigy. Thus he grew up a simple child delighting in, but unconscious of his faculty, 'playful as a kitten,' and devoted to his brothers and sisters. In 1812 he was sent to a private school kept by the Rev. Mr Preston, a Low Church clergyman, at Little Shelford, near Cambridge. There, and at Aspenden Hall in Hertfordshire, to which Mr Preston removed in 1814, he remained till his time came to go to college. He studied hard and read omnivorously; the taste for novels and light literature generally which he now acquired and never lost, brought him more than one rebuke from his father.

In October 1818 Macaulay went into residence at Trinity College, Cambridge; but he detested mathematics, and cannot be said to have distinguished himself as a student. Yet he twice won the Chancellor's medal for English verse, and obtained a prize for Latin declamation. In 1821 he carried off a Craven university scholarship; took the degree of B.A. the following year; and in 1824 was elected to a Fellowship. He was one of the most brilliant disputants in the Union Debating Society, and made the friendship of the ablest of his contemporaries, including Praed, Romilly, Charles Villiers, Moultrie, and above all Charles Austin.

In 1826 Macaulay was called to the bar and joined the Northern Circuit. But he had no liking for his nominal profession, and made no attempt to secure a practice. Already, indeed, literature had irresistible attractions for him. In 1823 he became a contributor to *Knight's Quarterly Magazine*, along with Praed and others of his Cambridge friends. In it there first appeared some of his best verses—in particular *Lucy*, *The Spanish Armada*, and *Nashby*. Certain of his prose articles, such as *The Fragment of a Roman Tale*, and *Scenes from the Athenian Revolt*, 'show,' says Cotter Morison, 'such a natural turn for a dialogue and dramatic *mise en scene*, that it says a great deal for Macaulay's good sense and literary conscientiousness that he remained content with this first success, and did not continue to work a vein which would have brought him prompt, if ephemeral popularity.' In 1825 the year in which he took his degree of M.A.—he was discovered by Jeffrey, then on the outlook for 'some clever young man' to write for the *Edinburgh Review*. The famous article on Milton appeared in the August number, and the unequivocal success which it met with not only secured him a position in literature, but was the means of opening to him the doors of society

and politics. But Macaulay's first thoughts were for his family. It was now in straitened circumstances, owing chiefly to his father being too much absorbed by the agitation for the abolition of the slave trade to attend to his business. Macaulay ungrudgingly took upon himself the task of supporting his brothers and sisters by his pen. Fortunately it was now in great demand. For nearly twenty years he was one of the most prolific of the writers to the *Edinburgh Review*, and out of sight the most popular. Macaulay was, however, claimed by politics. Certain of his articles had attracted the attention of the chiefs of the Whig party to which he had attached himself. In 1830 he entered parliament, having been presented by Lord Lansdowne with the pocket-borough of Calne. He threw himself with his usual intensity into the work of the House of Commons, and in his first session made a speech in favour of the bill for the removal of Jewish disabilities. But it was in the debates that preceded the passing of the Reform Bill that his great powers as an orator were in reality first manifested. While devoting himself to parliament, rivalling Stanley in debate and Hume in the regularity of his attendance, he discharged the duties first of Commissioner, and then of Secretary, to the Board of Control. At the same time he wrote steadily for the *Edinburgh Review*, and made almost as great a reputation as a conversationalist in society as he had already acquired as a parliamentary debater.

On the passing of the Reform Bill of 1832, Macaulay had exchanged Calne for Leeds. Mainly for the sake of his family he accepted the office of legal adviser to the Supreme Council of India, with a salary of £10,000 a year attached to it. Accompanied by his favourite sister Hannah, who in Dec. 1834 married Mr (afterwards Sir) C. Trevelyan, he sailed for Calcutta (by Madras), Feb. 15, 1834. In India he worked as hard as he had done in England. Besides discharging his duties as member of the Supreme Council, he acted as chairman of two committees—the committee of Public Instruction, and the committee appointed to prepare a Penal Code and a Code of Criminal Procedure. In the former capacity he drew up an elaborate minute, in which he successfully counselled the teaching of European literature and science to the natives of India. To Macaulay also must be assigned the lion's share of the great work performed in connection with the Indian Penal Code, of which Sir James Fitzjames Stephen has said: 'It is to the French Code Penal, and I may add the North German Code of 1871, what a finished picture is to a sketch. It is far simpler and better expressed than Livingstone's Code of Louisiana, and its practical success has been complete.' For a time Macaulay was extremely unpopular with a section of the British population of Calcutta, owing to the active part he took in bringing about a judicial reform known as the Black Act, which withdrew from British subjects resident in the provinces of India the privilege of bringing civil appeals before the Supreme Court of Calcutta. During his stay in India he read enormously, and wrote for the *Edinburgh Review* his essays on Mackintosh and Bacon. In the beginning of 1838 he returned to England with the competence he had saved from his official salary.

After a pleasant tour in Italy, Macaulay returned to political life, though not without reluctance, as he was already laying the foundations of his great historical work. In 1839 he was elected member for Edinburgh, and the year following entered Lord Melbourne's cabinet as Secretary at War. His most important work at this time was the writing of *The Lays of Ancient Rome*, which had been partially inspired by his visit to Italy. Never has

purely civic patriotism received a more spirited poetic rendering than in this volume. It appeared in 1842, and won an immense popularity. Next year he published his collected *Essays* in three volumes. While his party were in opposition, he delivered a number of weighty speeches in the House of Commons on subjects which interested him. By one of these he converted Sir Robert Peel, and indeed the majority of the House, to his views of copyright; in another he declared, 'Of all the institutions of the civilised world, the Established Church of Ireland seems to me the most absurd.' His connection with the *Edinburgh Review* ceased in 1845; he had now commenced his *History of England from the Accession of James II.* When Sir Robert Peel's administration fell in 1846, Macaulay took the office of Paymaster-general of the Forces, and was re-elected triumphantly for Edinburgh. A variety of circumstances, however, of which probably the support he had given in parliament to the Maynooth Grant, was the chief—led to his defeat at the general election of the following year.

Macaulay regarded this defeat as a signal for his retirement into private life. In 1852 he was again returned for Edinburgh without any exertion on his own part; but he made few speeches after his reappearance in parliament, and gave himself up almost entirely to his *History*. The first two volumes appeared in 1848, and at once attained a greater amount of popularity than had ever before fallen to the lot of a purely historical work (see LONGMAN). Next year he was elected Lord Rector of the university of Glasgow. He had a severe illness in 1852, and from this he never completely recovered. In 1855 the third and fourth volumes of his great work were given to the public, and were as cordially received as their predecessors. The following year he retired from the representation of Edinburgh. In 1856, also, he left the bachelor chambers he had occupied for fifteen years in the Albany, and took up his residence in Holly Lodge, Campden Hill, Kensington, where he lived till his death. In 1857 he was raised to the peerage under the title of Baron Macaulay of Rothley. In the same year he was elected a foreign associate of the French Academy of Moral and Political Sciences. Among other honours which came to him in his last years, and which he especially prized, was his nomination to the Prussian Order of Merit, and his election to the High Stewardship of the borough of Cambridge. While working steadily at his *History*, he found time to write for the *Encyclopædia Britannica* articles on Atterbury, Bunyan, Goldsmith, Samuel Johnson, and William Pitt. Though conscious that the ailment from which he suffered—weakness of the heart, complicated with asthma—would prove fatal, he took as keen an interest as before in the well-being of his relatives and in the fortunes of his country. The end came on the 28th December 1859; he died as he had always wished to die—without pain, without any formal farewell; proceeding to the grave all whom he loved, and leaving behind him a great and honourable name, and the memory of a life, every action of which was as clear and transparent as one of his own sentences. He was buried in Poet's Corner, Westminster Abbey, on 9th January 1860. The fragmentary fifth volume of his *History* which he left behind him was published in 1861.

The reputation of Macaulay is certainly not what it was during his lifetime or immediately after his death. He has been convicted of historical inaccuracy, of sacrificing truth for the sake of epigram, of allowing personal dislike and party bias to distort his views of men and incidents. He looks too much at the mere material side of life. As a

thinker he is deficient in balance, repose, inwardness, and modesty. In his writing there is far too much light and far too little shade; he not infrequently confounds the foaming hurry of his own words with the march of events; the splendour of his style sometimes degenerates into garishness; occasionally when he plays the censor, he almost sinks into insolent brutality. It must be admitted also that he was too declamatory to be accorded a place in the front rank either of poets or of historians. But as a narrator of events he has no rival, and hardly even a second; he is lucidity itself. The intellectual solidity and energy of Macaulay, the breadth and variety of his knowledge, the fervour and dignity of his patriotism—these remain untouched by posthumous criticism. And in his nephew's biography he stands revealed as the most affectionate and unselfish of relatives, loyal in his friendships, pure-minded as a child, generous, upright, and courageous. Of no public man, of no man of letters, can the nation be more whole-heartedly proud than of Macaulay.

The authoritative work on the life of Lord Macaulay is the *Life and Letters*—a most admirable biography—by his nephew, Sir George Otto Trevelyan, the first edition of which was published in 1876. A Life of his father by Viscountess Kintford appeared in 1900. Of the innumerable estimates of Macaulay which have appeared since his death, Cotter Morison's Monograph in the 'English Men of Letters' series (1882), an essay by Mr John Morley (*Critical Miscellany*, 1886), and an elaborate study by M. Taine (*History of English Literature*, vol. ii, 1871) may be mentioned.

Macaw. See PARROT.

Macaw-tree, GREAT (*Acrocomia sclerocarpa*), a palm of the same tribe as the cocoa-nut, a native of the West Indies and of the warm parts of America. It is called *Macaoya* in Guiana and *Mucabuba* in Brazil. It is from 20 to 30 feet high, with pinnated leaves from 10 to 15 feet long. The fruit yields an oil of a yellow colour, of the consistency of butter, with a sweetish taste, and an odour of violets, used in the native regions of the tree as an emollient in painful affections of the joints, and extensively imported into Britain, where it is sometimes sold as *Palm Oil*, to be used in the manufacture of toilet-soaps.

Macbeth, hereditary *normann* or ruler of Moray, married Gruoch, granddaughter of Kenneth III, king of Alban. In 1040 he slew Duncan, king of Scotia, near Elgin, and succeeded him on the throne, though to Thorfinn, the Norwegian earl of Orkney, he had to yield the region north and east of the Tay, and Cumbria and Lothian seem to have remained faithful to Duncan's infant sons. His seventeen years' reign is commemorated in the chronicles as a time of plenty. He granted lands to the Culdees of Locheleven 'with the utmost veneration and devotion; and, alone of Scottish kings, he made a pilgrimage to Rome (1050), and there gave large alms to the poor. Malcolm Canmore, King Duncan's eldest son, had fled to England on his father's death; and in 1054 his uncle Siward, Earl of Northumbria, led an army into Scotland against Macbeth. A bloody but indecisive battle was fought near Scone; and it was not till three years later that Malcolm, making a fresh independent attempt, drove Macbeth into Aberdeenshire, and killed him at Lumphanan, 15th August 1057. Such practically is all that is known for certain of the 'liberal king,' as St Berchan styles Macbeth. The fables immortalised by Shakespeare's genius have for pedigree Raphael Holinshed, out of Hector Boece, out of Boece's fertile fancy and Wyntoun. See Skene's *Celtic Scotland* (1876).

Maccabees, a word of uncertain meaning and origin, but the name Makkabi, originally given to Judas Maccabeus, is possibly connected with

Mappab, 'hammer.' The founder of the Maccabean dynasty, Matithjahu, or Mattathias, a priest (not, as generally supposed, a high-priest, nor even of the family of high-priests), was the first who made a stand against the persecutions of the Jewish nation and creed by Antiochus Epiphanes. He and his family were called Hasmonæans (Gr. *Asamoniæi*). At the beginning of the troubles he had retired, together with his five sons, Jochanan, Simon, Jehmdah (Makkabi), Eleazar, and Jonathan, to Modiin, a small place between Jerusalem and Joppa, to mourn in solitude over the desolation of the holy city and the desecration of the Temple. But the Syrians pursued him thither. He being a person of importance, Apelles, a Syrian captain, endeavoured to induce him, by tempting promises, to relinquish his faith, and to embrace the Greek religion. He answered by slaying with his own hand the first renegade Jew who approached the altar of idolatry. This gave the sign for a sudden outbreak. His sons, together with a handful of faithful men, rose against the national foe, destroyed all traces of heathen worship, and fled into the wilderness of Judah. Their number soon increased; and not long after, they were able to make descents into the adjacent villages and cities, where they circumcised the children, and restored everywhere the ancient religion of Jehovah. At the death of Mattathias (166 B.C.), which took place a few years after, Judas Makkabi (166-161 B.C.) took the command of the patriots, and repulsed the enemy, notwithstanding his superior force, at Mizpah, Beth-sur, and other places, reconquered Jerusalem, purified the Temple, and re-inaugurated the holy service (164 B.C.). Having further concluded an alliance with the Romans, he fell in battle against Bacchides (161 B.C.). His brother Jonathan, who succeeded him in the leadership, renewed the Roman alliance, and taking advantage of certain disputes about the Syrian throne, rendered vacant by the death of Antiochus, acquired the dignity of high-priest. But Tryphon, the guardian of the young Prince Antiochus Theos, fearing his influence, invited him to Ptolemais, and had him there treacherously executed. Simon, the second brother, was elected by the Jewish commonwealth to assume the reins of the national government, and was formally recognised both by Demetrius, Tryphon's antagonist, and by the Romans as 'chief and ruler of the Jews.' He completely re-established the independence of the nation, and the year after his succession (141 B.C.) was made the starting-point of a new era. The almost absolute power in his hands he used with wise moderation; justice and righteousness flourished in his days, and 'Judah prospered as of old.' But not long (seven years) after his accession to the supremacy, he was foully murdered (136 B.C.) by his own son-in-law, Ptolemy, who vainly hoped to succeed him. For the subsequent history of this family, see JEWS, HYRCANUS, and HEROD. The Feast of the Maccabees—i.e. both of the sons of Mattathias, and of the seven martyr children (2 Macc. vii.)—is found in the Roman martyrology under the date of the first of August. See De Sauley, *Histoire des Maccabees* (1880); Ewald, and Schurer.

Maccabees, BOOKS OF. Two books of this name are recognised as canonical by the Church of Rome, and enumerated in the articles of the Church of England among those apocrypha which 'the church doth read for example of life and instruction of manners, yet doth not apply to establish any doctrine.'

1. *Maccabees*, by far the more important of the two, after a rapid account of the conquests of Alexander the Great and the distribution of his dominions among his successors (i. 1-9), goes on to describe

the Hellenising policy of Antiochus Epiphanes towards the Jews and its baneful effects (i. 10-61). Chapter ii. gives the genealogy of the Maccabean family and an account of the efforts of the aged Mattathias to rouse the spirit of active resistance among his countrymen (168 B.C.). The rest of the book falls into three main divisions, relating respectively to Judas (iii. 1 ix. 22), Jonathan (ix. 23 xii. 53), and Simon (xiii. 1 xvi. 18), the sons of Mattathias, and concludes with a brief mention of the accession of John Hyrcanus, referring for details to 'the chronicles of his priesthood' (xvi. 19-24). The work as we now possess it is the Greek translation of a Hebrew original, which was still extant in Jerome's time. According to Origen its Hebrew title was *Sepherth Sabaniel* (meaning, perhaps, 'the prince of the house which God built up'). The date of its original composition cannot have been much (if at all) earlier than 106 B.C. (the last year of Hyrcanus), nor later than 64 B.C., at which time the relations of the Jews with the Romans changed so greatly for the worse. The author was plainly a Hebrew-speaking Jew, well acquainted with the topography of Palestine, who, if he had not actually witnessed or taken part in some of the transactions he describes, had at least conversed with those who had, and been at pains to make himself acquainted with the authentic oral traditions regarding them. He also had access to written documents, some of them of a public and official character. In spite of some inaccuracies and exaggerations he is entitled to high rank as a sober, painstaking, and trustworthy historian. The date of the Greek translation cannot be determined, but it was probably made very soon after the appearance of the original. 1 Maccabees was translated by Luther, who speaks of it as almost on a level with the canonical books, and hardly unworthy to be reckoned among them.

2 Maccabees opens with two letters (i. 1-9 and i. 10-ii. 18), purporting to be addressed by the Jewish authorities in Jerusalem to their brethren in Egypt, urging them to the regular observance of the Feast of the Dedication. The second and longer of the two contains much legendary and fabulous matter about Jeremiah and Nehemiah, and on the internal evidence generally it seems certain that both must be regarded as spurious. The reference in these letters to the wars of liberation leads the author of the book to speak of Judas Maccabeus, and to introduce himself as the epitomator of the five books of Jason of Cyrene on this theme. Who Jason of Cyrene was, or at what date he lived, is not known; he wrote in Greek, at some distance, both in place and in time it would seem, from the events he describes. He does not appear to have been acquainted with 1 Maccabees. The date of his epitomator is also uncertain; all that can be said with certainty is that it must have been prior to the destruction of Jerusalem in 70 A.D. In numerous instances the statements of 2 Maccabees do not admit of reconciliation with those of 1 Maccabees, and the result of critical examination is in every case in favour of the latter. It is evident that the epitomator, at least, if not also Jason himself, was comparatively indifferent to rigid accuracy in historical detail; he writes mainly with a didactic purpose, and seeks at every point to give prominence to supernatural interventions on behalf of the chosen nation.

Besides the above comparatively well-known writings, there occur in certain MSS. of the Septuagint two other books known also by the name of Maccabees, though called so only in a loose sense.

3 Maccabees, in seven chapters, relates two occurrences in the reign (222-205 B.C.) of Ptolemy IV. Philopator: his attempt to desecrate the Temple,

which was miraculously defeated through the prayers of Simon the high-priest, and the frustration of his vindictive scheme to destroy all his Jewish subjects, whom he had caused to be gathered together in the circus at Alexandria. The narrative is in many parts obviously fabulous, and at every point is without historical confirmation.

4 Maccabees, as its original title, 'On the Sovereignty of Reason' implies, is a discourse on the sovereignty of pious reason over the passions (i. 1-iii. 18); to this are appended numerous illustrations from the time of the Maccabees (iii. 19-xviii. 23). The second and larger portion may possibly have been based on the work of Jason of Cyrene (see above); the work as a whole is of a hortatory character, and the suggestion has been made that it was originally a synagogue sermon. Of the author nothing is known except that he was a sincere Jew, well read in Greek philosophy, and especially in that of the Stoics.

A fifth book of Maccabees, in Arabic, is printed in the Paris and London polyglots. It gives a summary of Jewish history from 180 B.C. to the close of the reign of Herod the Great, but has no independent value.

The best edition of the text of the four books of Maccabees is that of Fritzsche (*Libri Apocryphi Veteris Testamenti Græci*, 1871), and the best commentary that of Grimm in the *Ecclésiastisches Handbuch* (1 Macc. 1853; 2-4 Macc. 1857). English translations are given in Cotton's *Five Books of Maccabees in English* (1832).

Maccaluba, a small mud volcano, 138 feet in height, situated 6 miles N. of Girgenti in Sicily. The sides are studded with numerous small cones, which usually emit hydrogen, and occasionally mud and stones, often sending them to a great height.

MacCarthy, DENIS FLORENCE, an Irish poet, was born in Dublin, 26th May 1817. He became known as one of the young poets of that famous newspaper, the *Nation*, founded by Charles Duffly in 1842, and his collected *Ballads, Poems, and Lyrics* appeared in 1850. His 'Bell-Founder,' 'Voyage of St. Brendan,' 'Foray of Con O'Donnell,' and the 'Pillar Towers of Ireland,' quickly carried his fame over the land as well as to Irishmen beyond the sea. Shelley's translations from Calderon attracted him to Spanish, and in 1853 he published six of Calderon's dramas translated in the metres of the original, and further instalments followed in 1861, 1867, 1870, and 1873, earning the praises of Ticknor and Longfellow, and in 1881 a medal from the Royal Academy of Spain. In 1872 appeared *Shelley's Early Life*, and in 1879 he wrote the ode for the Moore centenary. For some years MacCarthy suffered from heart disease, and he died at Blackrock, near Dublin, April 7, 1882. A collected edition of his poems appeared in 1884.

MacCarthy, JESSES, a brilliant journalist and novelist, born in Cork, 22d November 1830. He became attached to the staff of the *Northern Times*, Liverpool, in 1853, and in 1860 entered the reporters' gallery of the House of Commons for the *Morning Star*, becoming its foreign editor the following autumn and chief editor three years later. He resigned his post in 1868, and devoted the next three years to an unusually complete tour of the United States, in which he visited as many as thirty-five of the thirty-seven states. Soon after his return he became connected with the *Daily News*, but he has also contributed among other magazines to the *London*, the *Westminster*, and the *Fortnightly Review*. He entered the House of Commons in 1879 as member for Longford, and was leader of the main wing of the Irish Home-Rule party ('Anti-Parnellite') from the deposition of Mr. Parnell (q. v.) till 1896, when he resigned the post. Of his novels the best known are *Paul Massie*

(1866), *The Waterdale Neighbours* (1867), *My Ewan's Daughter* (1869), *Lady Judith* (1871), *A Fair Saxon* (1873), *Linley Rockford* (1874), *Dear Lady Disdain* (1875), *Miss Misanthropie* (1877), *Dunno Quicote* (1879), *The Comet of a Season* (1881), *Maid of Athens* (1883), *Camillo* (1885), and *The Right Honourable*, with Mrs Campbell Praed (1886). His other works are *Can Moore*, a collection of essays (1868); *Critical Notice of George Sand* (1870); *Prohibitory Legislation in the United States* (1872); *Modern Leaders*, biographical sketches (1872); and *A History of our Own Times, from the Accession of Queen Victoria* (4 vols. 1879-80; vol. v. 1897), an exceedingly readable work, clear and useful, though neither erudite nor exhaustive. Without professing to be impartial, the author is unprejudiced and is unexpectedly sane on Irish questions, which he expounds rather than discusses. His literary criticisms are not always happy. Later works are *The Epoch of Reform* (1882) and *History of the Four Georges* (4 vols. 1889 *et seq.*). See his *Reminiscences* (1899).

McHeyne, ROBERT MURRAY, who has been called 'the George Whitefield of Scotland,' was born at Edinburgh on 21st May 1813, educated at the High School and university of his native town, and licensed as assistant preacher in Larbert and Dunipace in 1835. The scene of his life-work was, however, Dundee; he was elected minister of the new church of St Peter's there in 1836, and laboured in the same parish until his death, on 25th March 1843. In 1839 he visited Palestine as one of a mission of four ministers sent out by the Church of Scotland to inquire into the condition of the Jews, and on his return published, in conjunction with A. A. Bonar, *Narrative of a Mission of Enquiry to the Jews* (1839). He died on the very eve of the Disruption; had he lived he would certainly have thrown in his lot with the party of his former tutors, Dr Chalmers and Dr Welsh. Besides being an eloquent preacher, a man of saintly piety, and a most exemplary parish minister, McHeyne wrote hymns and published sermons, both of considerable merit. See his *Remains* (*Letters, Sermons, &c.*), with a Memoir by A. A. Bonar (1848; 129th thousand, 1881). His *Complete Works* appeared at New York in 2 vols. in 1847.

Macchiavelli. See MACHIAVELLI.

McClellan, GEORGE BRINTON, an American general, was born at Philadelphia, 31 December 1826, graduated at West Point with 'Stonewall' Jackson and others in 1846, and served with the engineers through the Mexican war, where repeated gallantry in action gained him a captain's brevet. He was afterwards employed as an instructor at West Point and on engineer duty in Texas, Oregon, and Washington, and in 1855 was one of three American officers sent to observe the campaign in the Crimea. In 1857 he resigned his commission, and engaged in railroad business until the outbreak of the civil war in 1861. In April he was appointed major-general of Ohio volunteers, and in May a major-general in the United States Army. By the middle of July he had driven the enemy out of West Virginia, which entered the Union as a separate state the year after. McClellan was now called to Washington to reorganise the Army of the Potomac, which was made up of either raw recruits or regiments fresh from the defeat at Bull Run; of these he received the command in August, and in November he was made commander-in-chief. But the authorities at Washington were too nervous to rest content with so slow and careful an organiser as McClellan; and when, in April 1862, he landed at Old Point Comfort, for the invasion of Virginia by the peninsula of the James River, he had already

been deprived of the command-in-chief. His peninsular campaign lasted till July, and ended disastrously, partly from want of support, and partly from over-caution. He advanced near to Richmond, but was compelled to retreat, fighting the 'seven days' battles' (June 25 to July 1) as he did so, and finally to evacuate the peninsula. He was now relieved of his command; but after the disastrous second battle of Bull Run (August 29-30), which was followed by a Confederate invasion of Maryland, he reorganised the army at Washington, marched rapidly north, met the forces of General Lee at Antietam (q.v.), and compelled him to re-cross the Potomac. This short campaign was McClellan's most brilliant achievement, but he undoubtedly failed to pursue his advantage as rapidly as he should. He followed the Confederates into Virginia, but with too great deliberation for the taste of the impatient cabinet, and in November he was superseded by General Burnside (q.v.). Here his share in the war ended. In 1864 he resigned his commission, and unsuccessfully opposed Lincoln for the presidency (see p. 640). He was then in Europe till 1868, and in 1875 was elected governor of New Jersey. He died at Orange, New Jersey, 29th October 1885. McClellan was the idol of his soldiers, and deserved their love by his care for them; but his caution in the field was excessive, and he was slow in preparing fresh plans or in meeting unexpected combinations. See his *Report on the Organisation and Campaigns of the Army of the Potomac* (1864); and *McClellan's Own Story*, edited by W. C. Prime (1886).

Macclesfield, an ancient municipal borough and important manufacturing town in the Macclesfield parliamentary division of Cheshire, is situated on the river Bollin, and on the western declivity of a range of low hills, 15 miles SSE. of Manchester and 167 NW. of London. Among its buildings are the fine old church of St Michael, founded by Queen Eleanor in 1278, the town-hall (1823-70), the infirmary (1872), and King Edward's grammar-school (1553), rebuilt in 1866, and reorganised in 1880, with an endowment of £2000 a year, which also supports a modern free school. Macclesfield has a public park of 16 acres (1852), public baths, a free library, a technical school, a school of science and art, &c. The old button trade belongs to the past; and the silk manufacture, established in 1756, is now the staple industry; cotton goods and smallwares are manufactured, and there are dye-works and breweries. In the vicinity coal, slate, and stone are obtained. Macclesfield, which possesses nine charters (the first by Prince Edward, Earl of Chester, in 1261), and which returned two members to parliament from 1832 till 1880, was disfranchised in 1885. Pop. (1851) 29,048; (1881) 37,514; (1891) 36,009. See works by Cory (1817) and Earwaker (1877).

McClure, SIR ROBERT JOHN LI. MESURILL, the discoverer of the North-west Passage, was born at Wexford, 28th January 1807, and entered the navy in 1824, served in Back's Arctic Expedition in 1836, and Ross's Franklin Expedition in 1848. As commander of another Franklin Expedition (1850-54) he passed in a sledge from Barrow Strait, where his ship, the *Investigator*, lay, to Melville Sound, connecting with the Arctic Ocean to the west. McClure was rescued by another expedition, made K.C.B., and after serving in Chinese waters, an admiral. He died 17th October 1873. See POLAR EXPLORATION and works there cited.

McCosh, JAMES, one of the most voluminous defenders of the Scottish philosophy in recent times, was born at Carskeoch, Ayrshire, 1st April 1811. After studying at Glasgow and Edinburgh, he became a minister of the Church of Scotland,

and was settled at Arbroath in 1835. In 1839 he removed to Brechin, and four years later cast in his lot with the Free Church. In 1851 he was appointed professor of Logic and Metaphysics in Queen's College, Belfast, a position which he held till 1868, when he was called to the Presidency of the college of New Jersey, Princeton, U.S.A. After a very successful tenure, Dr M'Cosh resigned this office in 1888 in order to devote the close of his life more exclusively to philosophical production. Dr M'Cosh's first important work was *The Method of the Divine Government, Physical and Moral* (1850; 9th ed. 1867). It was followed in 1860 by *The Intuitions of the Mind inductively investigated*. When Mill published his *Examination of Sir W. Hamilton's Philosophy* in 1865, Dr M'Cosh was one of the numerous critics who broke a lance for Scottish philosophy and examined the examiner. His *Examination of Mr J. S. Mill's Philosophy* (1866) is entitled 'a defence of fundamental truth.' Dr M'Cosh, who died 16th November 1894, defended what he considers the Natural Realism of Reid against both the empirical school and the relativistic views of Kant, Hamilton, and Mansel; and maintained the older intuitional view against the associationists and evolutionists on the one hand and the transcendentalists on the other. In 1875 he published a useful history of *The Scottish Philosophy*. He has also published a series of philosophical tracts for the times, collected as *Realistic Philosophy* (2 vols. 1887), *Psychology* (1886), and *First and Fundamental Truths* (1889). *The Religious Aspect of Evolution* appeared in 1890.

M'Crìe, DR THOMAS, a learned Scottish historian and divine, was born at Duns in November 1772, studied at the university of Edinburgh, and was ordained in 1795 pastor of an Anti-burgher congregation in that city. Here he died, 5th August 1835. M'Crìe's works are in the highest degree valuable to the student of Scottish ecclesiastical history. They exhibit research at once vast and minute, and though they are essentially apologetic, yet their author is never consciously unfair, and does not misstate facts. He shows, however, such admirable skill in finding palliation even for the less defensible acts of the Reformers, and so warm a zeal for Presbyterianism, that the impartial Hallam described his spirit as 'Presbyterian Hildebrandism.' He attacked Sir Walter Scott's account of the Covenanters in *Old Mortality* in three trenchant papers in the *Edinburgh Christian Instructor*, and most unprejudiced readers were compelled to admit that he had the best of the controversy. Readers of *My Schools and Schoolmasters* will remember the admirable description of the militant-looking divine's person and preaching. His best-known works are *The Life of John Knox* (1812), *The Life of Andrew Melville* (1819), and the less satisfactory *History of the Progress and Suppression of the Reformation in Spain* (1829). His works were collected in 4 vols. (1855-56), and a Life was published in 1840 by his son, Thomas M'Crìe, D.D., LL.D. (1798-1875), professor in the Presbyterian college at London, and himself the author of *Sketches of Scottish Church History* (1841), and *Annals of English Presbyterianism* (1872).

M'ulloch, HORATIO, a Scottish landscape-painter, was born in Glasgow in 1805. He exhibited for the first time in 1829; in 1836 he was elected an A.R.S.A., and in 1838 an R.S.A., when he removed to Edinburgh. Here he lived till his death on 24th June 1867. He painted the Highland landscapes with unrivalled truth, breadth, and imagination, among his principal pictures being 'Highland Loch,' 'Loch-an-Eilan,' 'View in Cadzow Forest,' 'Dream of the Forest,' 'Misty Corries,' 'Deer Forest, Isle of Skye,' 'Loch

Achray,' 'Mist rising off the Mountains,' 'Kilchurn Castle, Loch Awe,' and 'Bothwell Castle, on the Clyde.'

MacCulloch, JOHN, geologist, born in Guernsey of a Scottish family on 6th October 1773, studied medicine at Edinburgh, and became assistant-surgeon to an artillery regiment. In 1811 he was employed by government in geological and mineralogical researches in Scotland; in 1820 he became physician to Prince Leopold of Saxe-Coburg, afterwards king of the Belgians; and in the later years of his life he was professor of Chemistry and Geology in the East India Company's military school at Addiscombe. He died at Penzance, Cornwall, 21st August 1835, in consequence of an amputation rendered necessary by a carriage accident. His most important works are a *Description of the Western Islands of Scotland* (1819); *A Geological Classification of Rocks, with Descriptive Synopses* (1821); *A System of Geology, with a Theory of the Earth* (1831); *Malaria* (1827); and *The Remittent and Intermittent Diseases* (2 vols. 1828).

M'ulloch, JOHN RAMSAY, political economist, was born at Whithorn, Wigtownshire, 1st March 1789. At first a clerk in a lawyer's office, he became known in connection with the *Scotsman* newspaper (of which he was editor in 1818-19) and the *Edinburgh Review*. He made his debut in the *Review* in 1818, with an article on Ricardo's *Principles of Political Economy*, and for twenty years contributed almost all the economical articles, with a few on other subjects. He lectured and taught in London on political economy; in 1828 was chosen professor of Political Economy in University College, London; in 1838 was appointed Comptroller of H.M. Stationery Office, a situation which he held till his death, 11th November 1864. His principal publications comprise: *The Principles of Political Economy* (1820); *The Literature of Political Economy* (1845); *On the Succession to Property vacant by Death* (1848); *On the Rate of Wages* (1826-51); *A Dictionary of Commerce* (1832; new ed. 1875-80); *Dictionary of the British Empire* (1837); *Geographical Dictionary; A Treatise on Taxation and the Funding System* (1845); *Dictionary, Geographical, Statistical, &c.* (1841-42); *Partnership, &c.* (1856). He also edited Smith's *Wealth of Nations* and Ricardo's works. M'ulloch was a Foreign Associate of the Institute of France; and Peel conferred on him a pension of £200 a year.

MacCunn, HAMISH, composer, was born in Greenock, 22d March 1868. After study under local teachers, in 1883 he won a scholarship at the Royal College of Music. His progress there was so rapid that in the following year he was able to resign it. In 1888 he was appointed a junior professor of Harmony at the Royal Academy. He is regarded as one of the most promising composers of the day, his works having already won high approbation. Beginning with the overture *Cior Mhor* produced at Glasgow, 22d Jan. 1887, they embrace two other overtures, *Land of the Mountain and the Flood* and *The Dowie Dens of Yarrow*; choral works, including *The Lay of the Last Minstrel*; some songs; and the operas *Jeanie Deans* (1894) and *Diocletian* (1897); libretto by present Duke of Argyll. Possessing fertility in melody and a remarkable mastery of the orchestra, he is a pronounced upholder of nationality in music, and his works are distinctly Scottish in character.

Macdonald, ETIENNE JACQUES JOSEPH ALEXANDRE, was born 17th November 1765 at Sedan, his father, a schoolmaster (born in South Uist, educated at Douai), who followed Prince Charlie to France, being of the stock to which Flora

Macdonald also belonged. He entered the army in 1781 and, embracing the cause of the Revolution, rapidly rose to high rank: he distinguished himself at Jemappes, and by the capture of the Dutch fleet (1795) after crossing the ice. In 1798 he was made governor of the Roman States, and, having routed the army of the king of Naples at Otricoli, he completed the subjugation of that kingdom. In the following year he marched to North Italy, to check the inroad of Suwaroff, who, however, defeated him after a three days' bloody contest on the Trebbia. In 1800 and 1801 he commanded the army of reserve in Switzerland and marched across the Splügen. But in 1805 he lost the favour of Bonaparte by his support of Moreau. Four years later the emperor, hard pressed, summoned Macdonald to command the right wing of the army of Italy. He took Laibach, and distinguished himself at Wagram, and was created marshal and Duke of Taranto. He held a command in Spain in 1810, and in the Russian campaign; and in 1813 he contributed to the successes of Lutzen and Bautzen, but was utterly routed by Blücher at the Kutzbach. After the battle of Leipzig he helped to cover the retreat of the French army. In the subsequent struggles on French ground Macdonald made desperate efforts to face the enemies of Napoleon; but, seeing that further resistance was hopeless, he advised the emperor to abdicate. The Bourbons made him a peer, and gave him the command of a military division; but he refused to serve during the Hundred Days. From 1816 he was Chancellor of the Legion of Honour, and took an active part in the discussions of the Chamber of Peers. He died at Courcelles, Loire, 25th September 1840. See his *Souvenirs* (1892; trans. 1892).

Macdonald, FLORA, 'a name,' said Dr Johnson, 'that will be mentioned in history, and, if courage and fidelity are virtues, mentioned with honour.' Born in 1722 at Milton in South Uist, she lost her father, a tacksman, at two; and her mother four years later was abducted to Skye by Hugh Macdonald of Armadale. Flora stayed behind in Uist with her only surviving brother, Angus, and at thirteen was practically adopted by Lady Clanranald, the wife of the chief of the clan. To this Flora owed her gentle upbringing, her three years' schooling at Edinburgh. She had not long returned to the Hebrides when the rebellion of the '45 broke out; and in June 1746, ten weeks after Culloden, she conducted Prince Charles Edward, disguised as 'Betty Burke, the Irishwoman,' from Ormicule in Benbecula to Monkstall in Skye, and thence by way of Kingsburgh to Portree. That she was in love with the 'young hero' is absolutely false—she was not even a Jacobite; but those three short perilous days endeared her to more than Jacobites, and she was much feted during her twelvemonth's captivity on the troopship in Leith Roads and at London. In 1750 she married the son of Macdonald of Kingsburgh, and at Kingsburgh in 1773 she entertained Dr Johnson, who describes her as 'of middle stature, soft features, gentle manners, and elegant presence.' In 1774 her husband emigrated to North Carolina, and in 1776, on the outbreak of the war of independence, he became a brigadier-general (his five sons, too, were all British officers). He himself was made prisoner; and Flora, returning to Scotland in 1779 with her younger daughter, got her arm broken during the voyage in a fight with a French privateer. After two years at Milton, she was rejoined by her husband, and they settled again at Kingsburgh; but it was at Peindinn, a neighbour's house, that she died on 5th March 1790. Shrouded in a sheet that had wrapped Prince Charles Edward, she was buried at Kilmuir, in a grave

now marked by an Iona cross (1880) of Aberdeen granite, 28½ feet high.

The so-called *Autobiography of Flora Macdonald* (2 vols. 1869) is a silly forgery; but reference may be made to *Flora Macdonald and Prince Charles*, by the Rev. Alexander MacGregor (1882), and to *Flora Macdonald in Uist*, by W. Jolly (1886).

Macdonald, GEORGE, a Scottish poet and novelist, born at Huntly, Aberdeenshire, in 1824, educated at Aberdeen University and the theological college of the Congregationalists at High-bury. He became minister at Arundel in Sussex, and afterwards at Manchester, but was compelled by the state of his health to give up preaching. A short residence in Algiers restored him to comparative vigour, and, returning to London, he took to literature as a profession. His first book, *Within and Without*, a poem, appeared in 1856, and was followed by *Poems* (1857), and *Phantastes, a Faerie Romance* (1858), a poem as irregular as *Kilnycny*, and almost as full of beauty and power. A long series of novels followed, including *David Elyngbrod* (1862); *The Portul* (1864); *Alice Forbes of Howglen* (1865); *Annals of a Quiet Neighbourhood* (1866); *Guild Court* (1867); *The Seaboard Parish* (1868); *Robert Falconer* (1868); *Wilfrid Cumbermole* (1871); *Malcolm* (1874); *St George and St Michael* (1875); *Thomas Wingfold, Curate* (1876); *The Marquis of Lossie* (1877); *Sir Gibbie* (1879); *What's Mine's Mine* (1886); *Lilith* (1895); and *Salted with Fire* (1897). Almost all these novels contain passages of singular beauty, and are lightened up by fine fancy and descriptive power, but they are badly constructed and defective in harmony as works of art. They reveal the deep spiritual instincts of their author in his reaction against Calvinism, as well as the nebulousness of his mental atmosphere and his inability for sustained thought. The dialect is that of Aberdeen and the north-eastern counties, and sounds feeble to the ear after the classic vigour of the language of Burns and Scott. He has also published books for the young: *Dealings with the Fairies* (1867), *Ronald Bannerman's Boyhood* (1869), *At the Back of the North Wind* (1870), and *The Princess and the Goblin* (1871); besides religious works: *Unspoken Sermons* (3 series, 1866-89), and *The Miracles of Our Lord* (1870). Macdonald is well known as a lecturer, and in 1872-73 he made a lecturing tour in the United States. In 1877 he received a Civil List pension of £100.

Macdonald, SIR JOHN ALEXANDER, Canadian statesman, was born in Glasgow, 11th January 1815, and with his parents emigrated five years later to Canada. He was educated at Kingston, called to the bar in 1836, and appointed a Q.C. in 1846. He represented Kingston in the Canada Assembly from 1844 till the union of the provinces in 1867, and in the Dominion parliament till 1878, when he was defeated; but he afterwards sat for Victoria, British Columbia, and for Carleton and Lennox, and was again returned by his old constituency in 1887. Before the union he had been Receiver-general in 1847, Commissioner of Crown Lands in 1847-48, Attorney general for Upper Canada in 1854-58, succeeding Sir Allan Macnab as leader of the Conservatives and premier in 1856, and again Attorney general in 1858-62 and 1864-67. On 1st July 1867, when the new constitution came into force, he was called upon to form the first government for the new Dominion, and was minister of Justice and Attorney general of Canada until he and his cabinet resigned in 1873. He was again returned to power in 1878, and was successful in the elections of 1882 and 1887. In 1878 his success was owing to the adoption of a policy of protection for native industries, which discriminates against the productions of all other

countries, not even excepting Great Britain. Sir John was mainly instrumental in bringing about the confederation of the British North American provinces, and in securing the construction of the Intercolonial and Pacific railways; and he was a pioneer of imperial unity. In 1871 he was appointed one of the British Commissioners for the settlement of the Alabama claims. He was made a privy-councillor in 1872, K.C.B. in 1867, and G.C.B. in 1881, and received honours from Oxford and the Canadian universities. He died 6th June 1891. His widow was made a peeress of the United Kingdom, and a bust of Sir John was erected in Westminster Abbey in 1892. See Life by Pope (1894).

Macduff. See BAXFF.

Mace, a thick, heavy club or staff, about 5 feet long, surmounted by a metal head, frequently spiked, which was used by knights and warlike churchmen in the middle ages. The ornamental maces of parliament, the universities, and city corporations, borne as an ensign of authority, may be traced to the 12th and 13th centuries, when princes armed their guards with spikeless maces as the handiest against the sudden attacks of the Assassins (q.v.). The need passed away, but the maces remained as symbols of rank. The House of Commons has possessed three maces. The first disappeared after the execution of Charles I. The second was the 'hauble' that Cromwell had removed; it has been claimed that a mace preserved in the museum at Kingston, Jamaica, is the same. The sergeant-at-arms at the close of the session hands over the mace to an official of the crown, getting a receipt for it; it is kept under lock and key till the House meets again. In the congress of the United States the sergeant-at-arms has a silver mace. The Lord Mayor's mace, of silver gilt, and weighing nearly a quarter of a hundred weight, dates from 1735.

Mace, the Aril (q.v.) or inner covering of the Nutmeg (q.v.). It is a lacerated membrane, blood-red when fresh, varying in length according to the variety. There are two varieties of nutmeg cultivated, one named 'Royal,' the other 'Green.' The former bears the longer and finer quality of mace. The mace is removed from the nutmeg and dried in the sun a few days, when it quickly loses its fine red colour and becomes light brown. It is then sprinkled with sea-water to preserve it and render it flexible, and is pressed flat, in which condition it is exported, chiefly from Penang and Singapore. Mace is the most aromatic part of the fruit, and yields both fixed and essential oils. The former, obtained by expression, is highly fragrant, of buttery consistence, and brown colour. It is powerfully stimulant, and in India is employed as a liniment and embrocation in rheumatism. The essential oil is extracted by distillation. It possesses the fragrance of mace, and is yellow in colour. Mace is a native of the Moluccas and neighbouring islands, but is cultivated in Java, Penang, Sumatra, Mauritius, and other parts of the East, and in Cayenne, Martinique, and some of the West India Islands. The aril of other species of Myristica (Nutmeg) of inferior quality occasionally appears in commerce.

Macedonia, anciently the name of a country lying N.W. of the Egean Sea. Originally of small extent, it stretched at the period of its greatest area from the Hæmus (mod. Balkan) range on the N. to Thessaly and the Egean on the S., and from Epirus and Illyria on the W. to Thrace on the E. The country is on the whole mountainous, especially in the south and west, but there are several large plains of great fertility. The principal rivers were the Strymon, Axius, and Haliacmon. Compare TURKEY. Macedonia was famous

for its gold and silver mines, and its oil and wine. It contained a number of flourishing cities, of which the names are well known in ancient history, particularly Egea (Edessa) and Pella, the capitals, Pydna, Thessalonica, Potidea, Olynthos, Philippi, and Amphipolis. Perdiccas I. (c. 700 B.C.) is reputed to have been the first king and founder of the Macedonian monarchy. In 490 B.C. and again ten years later Macedonia was compelled to take part with the Persians in their invasions of Greece. Under the wise and vigorous reign of Archelaus (413-399 B.C.), an admirer of Greek art and civilisation, Macedonia greatly increased in prosperity and power. But a period of civil wars and anarchy then ensued, and was only terminated by the accession of Philip II. (359 B.C.), who, having seated himself firmly on the throne, developed the resources of his kingdom, and laid the foundation of its future greatness (see GREECE). His son, Alexander III., surnamed the Great, brought half the then known world under his sway; but after his death the Macedonian empire was broken up, and, after twenty-two years of incessant warfare, was formed into four kingdoms under his principal generals (see PHILIP and ALEXANDER). Macedonia, with Greece, fell to Antipater's son Cassander. But in the wars against the Gauls, the civil strifes of the descendants of Alexander's generals, and in the ambitious designs of Pyrrhus, king of Epirus, Macedonia almost perished as a kingdom. It was, however, once more established securely by Antigonus Gonatas (277-239), the grandson of Alexander's general Antigonus, who had obtained part of Asia Minor. The kingdom preserved the limits set it by Antigonus down to its conquest by the Romans in 168 B.C. Twenty-five years later Macedonia was made a Roman province, in which Thessaly and part of Illyria were included. On the partition of the Roman world, it was incorporated in the eastern empire. In the end of the 6th century it was settled by Slavonic races, and subsequently formed part of the kingdoms of the Bulgarians (10th century), Salonica (ruled by Boniface, Marquis of Montferrat), Thessalonica (1224), the Servians (14th century), and finally the Turks, who still hold it. The population of the coast districts are Greeks, whilst in the interior Christian Bulgarians greatly preponderate.

Maccio, a part of Brazil, the capital of Alagoas state, lies on a peninsula that shuts in the Lagoa do Norte from the sea. Cotton and machinery are manufactured, and there is an active trade in maize, sugar, cotton, &c. Two railways run from here into the interior. Pop. 12,000.

Macerata, a walled town of Central Italy, picturesquely perched upon an eminence (1207 feet), 41 miles by rail S. of Ancona. It has a cathedral, a beautiful town-hall of the 13th century; university, and manufactures of glass and pottery. Pop. 10,063.

Macfarren, SIR GEORGE ALEXANDER, one of the most prominent composers and writers on musical theory during the 19th century in England, was born in London, March 2, 1813, and educated at the Royal Academy of Music, at which institution he became a professor in 1834. In 1875 he was appointed Principal of the Academy, and also professor of Music at Cambridge University. Later in life he became blind, and died 31st October 1887. He was knighted in 1883. As an operatic composer Macfarren is the most characteristic representative of the national English school—his aim being to revive the old English music in modern opera. His earliest dramatic work, *The Devil's Opera*, was produced in 1838; *Don Quixote* followed

in 1846, *King Charles II.* in 1849, *Robin Hood* in 1860, *Jessy Lea* in 1863, and *She Stoops to Conquer, The Soldier's Legacy, and Helvellyn* in 1864. His best cantatas were *Lenore* (1852), *May-day* (1853), *Christmas* (1860), and *The Lady of the Lake* (1877). He did not produce his first oratorio, *John the Baptist*, until 1873: it had for successors, *The Resurrection* (1876), *Joseph* (1877), and *David* (1883). Macfarren's works comprise numerous other small dramatic pieces, as well as chamber music, vocal and instrumental, and several symphonies and overtures. He stands higher, however, as a writer on the theory of music than as a composer. He was an enthusiastic advocate of the views of Alfred Day (1810-49) as laid down in that writer's *Treatise on Harmony* (1845), and for many years stood almost alone in his advocacy of it. As a decided conservative in music, Macfarren manifested little sympathy for such modern schools as Wagner's. He wrote *Rudiments of Harmony* (1860; 13th ed. 1885), *Lectures on Harmony* (1867; 3d ed. 1882), *Counterpoint* (6th ed. 1886), *A Musical History* (1885), and *Addresses and Lectures* (1888); besides editing *Old English Ditties* (1857-80), *Moor's Irish Melodies* (1859), *Scottish Ditties* (1861-80), and the second edition of Day's *Treatise* (1886). See the *Life and Works of Sir G. A. Macfarren* (1891).

M'Gill, James, philanthropist, was born in Glasgow, 6th October 1744, and died in Montreal, Canada, 19th December 1813. He emigrated to Canada before the American revolution, engaged for some time in the North-west fur trade, and, subsequently settling in Montreal, became a successful merchant there. He was for many years a member of the Lower Canada Assembly, and subsequently a member of the legislative and executive councils. He was noted for philanthropy. He bequeathed to the college in Montreal that bears his name property valued at £30,000 and £10,000 in money; but, in consequence of the increased value of land, these figures convey a very inadequate idea of the present value of his gift to McGill College.

Macgillyendy Reeks, a group of rugged mountains in Ireland, in County Kerry, rise from the western shores of the Lakes of Killarney, and cover an area of 28 sq. m. Carran-Tuad, the loftiest peak, not only of the Reeks but in all Ireland, is 3414 feet in height. Caher, the next in altitude, reaches 3200 feet, and there are several others which exceed 2500 feet.

MacGregor, John, canoeist and philanthropist, eldest son of General Sir Duncan MacGregor, was born at Gravesend, January 24, 1825, and a few weeks later was the first to be handed out of the burning *Kent*, East Indianman. He was educated at various private schools, at Dublin, and at Trinity College, Cambridge, where he graduated as a wrangler, and took his B.A. in 1847. In the same year he entered the Inner Temple, and was called to the bar in 1851. He did some writing and sketching for *Punch* in 1845. His desire to travel led him to make a tour of Europe, Egypt, and Palestine (1849-50); and a subsequent visit to the United States and Canada bore fruit in *Our Brothers and Cousins* (1859). The rise of British canoeing has been largely due to his example and influence since 1850. He published an account of a canoe journey in 1865, under the title of *A Thousand Miles in the Rob Roy Canoe* (1866). Other narratives of canoe voyages on the Baltic, Zuider Zee, and Jordan followed. He was captain of the Canoe Club (1866), and contributed papers on Marine Propulsion to the British Association. He was a member of the London School Board for Greenwich in 1870, and again in 1873; when chairman of the Industrial School Commission, he sug-

gested the founding of the London Shoebblack Brigade; and he gave the profits of his books and lectures—£10,000 to philanthropic schemes. He died 16th July 1892. See *Life* by Hodder (1894).

MacGregor, Robert. See *Rob Roy*.

Machair'odus, a gigantic sabre-toothed tiger of the Pleistocene period, with canine teeth 6 or 8 inches long, and jagged at their edges like a fine saw. Its remains were found in Kent's Cavern (q.v.).

Machiavelli, Niccolò di Bernardo del, born of an ancient burgher family at Florence, in 1469, and a pupil of the celebrated scholar, Marcello Virgilio, was employed in public affairs from a very early age, and may be regarded as the literary representative of the political life of the important period to which he belongs. The years of his early manhood were passed amid the political troubles occasioned by the French invasion under Charles VIII. (1493), when the Medici fled from Florence, and the republic was proclaimed, and a new constitution formed under the influence of the great reformer, Savonarola. Machiavelli's first appearance in public life was in the year of his famous contemporary's fall from power, and execution. He was elected in June 1498 to a subordinate secretaryship in the department of 'Il vece di Balìa'—i.e. the Ten chosen to direct the military and diplomatic affairs of the republican government. He was promoted in July of the same year to the chief-secretaryship under this same commission. This position, which, though honourable, was subordinate, he occupied until the fall of the republic in 1512. His immediate superior in office was Marcello Virgilio Adriani, a celebrated humanist, whose companionship is supposed to have stimulated in Machiavelli the enthusiasm for the study of the classics. It seems proved, however, that Machiavelli did not know Greek, and cannot be classed among the erudite of that cultured age. Machiavelli's duties were almost entirely diplomatic: he was employed in a great variety of missions, the instructions and correspondence connected with which may almost be said to contain the secret political history of Italy during his time. The culminating point of his reputation as a diplomatist was his mission to the great master of treachery and dissimulation, Cesar Borgia, Duke of Valentinois, commonly called 'Il Valentino,' in 1502, of which an account is preserved in fifty-two letters written during the course of the negotiation, unsurpassed in dramatic interest by any series of state papers. In the complicated external relations which Florence had now assumed, Machiavelli is found in communication with all the great foreign powers, as he had hitherto been with the Italian principalities. Between 1500-11 he formed part of important missions, once to the German emperor Maximilian, and four times to France. His despatches during these journeys, and his treatises on the 'Affairs of France and Germany,' are full of a far-reaching insight into the causes and effects of the various characteristics he had seen and studied. The most important part which Machiavelli took in public affairs was his spirited attempt to raise a trained body of citizens able, without the aid of treacherous mercenaries, to defend their liberty against foreign invasion.

The sincere patriotism which ennobles his writings and his life filled him with forebodings for the fate of his country, and especially of his beloved native town, and inspired him to teach with fervour the only mode of reviving her ancient dignity and independence. On the restoration of the Medici in 1512, Machiavelli was involved in the downfall of his patron, the Gonfaloniere Soderini. He was arrested on a charge of conspiracy in 1513.

On being put to the torture, he disclaimed all knowledge of the alleged conspiracy; but, although pardoned, in virtue of the amnesty ordered by Leo X., he was obliged for several years to withdraw from public life, during which period he devoted himself to literature. It was not till the death of the young Lorenzo de' Medici, in 1519, that Machiavelli began to recover favour. He was commissioned in that year by Leo X. to draw up his report on a reform of the state of Florence; and in 1521 and the following years he was officially employed in various diplomatic services and as historiographer. After the disastrous defeat of the French at Pavia (1525), Italy lay helpless before the advancing forces of the Emperor Charles V., whose ferocious soldiery, though nominally allies, sacked the rich and defenceless Italian towns in their power. Machiavelli used his failing energies, undermined by chronic disease, to rouse his fellow citizens in their own defence, and in negotiations to avert from Florence the invading army on its way to Rome. In May 1527, on receiving the news of the sack of Rome and imprisonment of Pope Clement VII. (Ginlio de' Medici), the Florentines again drove out the Medici rulers and proclaimed the republic. But Machiavelli found that he was to be allowed no part in the popular movement for liberty and for defence against the foreigner; his patriotism was doubted, and he was suspected of favouring the Medici. This bitter disappointment, added to his already feeble health, brought on an illness, of which he died on the 20th June of the same year. His death was accompanied by the usual ministrations of the church, for, though he had written much against clerical corruption and tyranny, he had never impugned, nor indeed even disowned, religious doctrine. He was interred in his family's burying-place in Santa Croce, but all exact record of the spot is lost, the family having become extinct as early as 1597.

Through misrepresentation and misunderstanding of his writings, his name became after his death hated, and his teachings were spoken of as almost diabolical, his earliest and most violent assailants being the clergy, and especially the Jesuits. Although his writings were several times partially published in a more or less garbled form, the first great edition was not issued until 1782; it was dedicated to Earl Cowper, who had had a leading part in encouraging the publication, as also in promoting a public subscription for a monument to Machiavelli in Santa Croce. From that period until our own day his fame has steadily increased, and his pre-eminent position as the founder of political science is now assured.

Machiavelli's writings fill 6 vols. 4to (Florence, 1782), or 10 vols. 8vo. Besides his letters and state-papers, his historical writings also comprise *Florentine Histories*, extending from 1215 to 1492, with a fragmentary continuation to 1499; *Discourses on the First Decade of Titus Livius*; a *Life of Casteruccio Casteruciani* (unfinished); a *History of the Affairs of Lucca*. His literary works comprise an imitation of the *Golden Ass* of Apuleius, an essay on the Italian language, and several minor compositions. He also wrote *Seven Books on the Art of War*, which has been much admired by the learned in military science. But the great source of his reputation, for good or for evil, is the celebrated book *De Principatibus*, or, as it has since been called, *Il Principe*. The main question discussed in this world-famed book is: How principalities may be governed and maintained. In resolving this question, various cases are supposed, for each of which appropriate rules, principles, and suggestions are laid down, and all are illustrated both by contemporary examples and by a wealth of historical learning which it is difficult

to overrate. The 7th chapter, in which he details with evident admiration the system of Caesar Borgia, and the 18th, in which he discusses 'the duty of princes as to the obligation of keeping faith,' are perhaps those which have most contributed to draw upon the author the odious reputation of which his very name has become the symbol; but, in truth, these chapters are only more precise and more formal than the rest, from their heaping together statements which are elsewhere insinuated or supposed. The broad scheme of the book is everywhere the same—viz. that for the establishment and maintenance of authority all means may be resorted to, and that the worst and most treacherous acts of the ruler, however unlawful in themselves, are justified by the wickedness and treachery of the governed. Such being the moral of the book, a question has arisen as to the intention of the writer, and a favourite theory for a time prevailed, that *The Prince* was but a satire upon absolutism, and was designed to serve the cause of liberty, of which Machiavelli was an ardent friend, by making arbitrary power odious and contemptible. This theory, however, besides being utterly irreconcilable with the tone of the work, is completely disproved by a letter of Machiavelli to his friend Vettori (1513), which was discovered only in 1810, and which shows that *The Prince* was written by Machiavelli in all seriousness, in order to recommend himself to the Medici (for whose private perusal it was designed, and not for publication) as a master in the art of government. In his ardour for the liberation of Italy from the rule of foreigners, Machiavelli had become convinced that strong native governments, even though absolute, must be endured; and, having accepted that of the Medici for Florence, he was content to use all means for its security and consolidation. *The Prince* was published, after Machiavelli's death, at Rome, in 1532; and, if any doubt should be entertained as to the seriousness of the author, the book need only be compared with the commentary which is furnished by every page of his *Legazioni*, or the reports of his diplomatic missions, which are also contained in his collected works. Of the many criticisms and rejoinders to which *The Prince* has given occasion, the most remarkable is that of Frederick the Great, *Anti-Machiavelli, ou Examen du Prince de Machiavelli* (1740); and *The Prince* was condemned by Pope Clement VIII.

The comedies of Machiavelli form an epoch in the history of the Italian theatre, as he and his great contemporary, Ariosto, were the first to represent actual life and dialogue in their plays. Machiavelli's famous comedy, *La Mandragola*, full of biting humour and shameless indecency, is a masterpiece of dramatic art.

Among the many noted historians who have discussed the work and morality of Machiavelli, we may note Macaulay's brilliant essay, and in the more modern style of historical criticism Leopold Ranke's study in *Zur Kritik neuerer Geschichtschreiber*. The most complete and remarkable work on Machiavelli is that by P. Villari, *Niccolò Machiavelli e i suoi tempi* (1877-82; Eng. trans. 1890). Tommasini's *Vita e Scritti di Machiavelli* (1883) is full of careful research. Mr John Morley's Romanes Lecture on *Machiavelli* was published in 1897.

Machine Gun may be defined as a weapon mechanically loaded with fixed ammunition from a hopper or frame, so as to fire a succession of projectiles from a rest or carriage, in contradistinction to hand weapons, such as Repeating (or magazine) Rifles (q.v.) and Revolvers (q.v.).

Machine guns may be divided into two classes—the mitrailleuse, which discharges a stream of bullets not much exceeding 1 inch in diameter, and the revolving cannon or quick-firing gun, which throws an explosive shell of several pounds

weight. The first class includes rifle-calibre guns for use against troops, and naval guns firing steel shot capable of piercing the sides of a torpedo boat. The second is an improvement on ordinary Cannon (q.v.), though perhaps sometimes considered less suited to all the contingencies of a campaign, in consequence of the comparatively delicate nature of the mechanism employed.

A breech-loading Requa battery (an improved Ribaudequin or organ gun), consisting of thirty-one rifle-barrels arranged in three parallel rows, loaded simultaneously by means of a set of chambers, and fired at once by a single cap, has been in the Rotunda Museum at Woolwich since before 1830. A Requa battery was used at the siege of Charleston in 1863, and seems to contain the germ of such inventions as the Gardner and Nordenfelt machine guns, while those like the Gatling and the Hotchkiss revolving cannon seem traceable to the early patterns of revolver-pistol. The first of such weapons to be used in field operations was the Gatling, which was tested in the American civil war, and exhibited in the Paris Exhibition of 1867. This weapon (fig. 1) usually has ten barrels and ten locks, revolved round a fixed axis by means of a handle or crank. In addition to revolving with the barrels, each lock is at the same time gradually pushed forward, so as to carry the cartridge into the barrel, close the breach, and fire the charge as soon as the barrel comes under the sights. It then commences to move backwards, drawing with it the empty cartridge-case, so that, when one revolution of the barrels is complete, the open breech is brought under the drum from which a second cartridge falls into it. Thus, when the ten-barrelled gun is in action, there are always five cartridges going through the loading process and five others being gradually extracted; and this goes on as long as the gun is fed with cartridges, which may be done either by hand, or, as is more usual, by means of a drum fixed above the barrels, as shown in fig. 1. This type of machine gun cannot fire a volley, but the rapidity of its fire is limited only by the movement of the handle,

Fig. 1.

Medium size Gatling, mounted on Field Carriage.

It can also be worked with a slight swaying action, when firing rapidly, so as to spread the bullets over a certain amount of lateral space, like water from a fire-hose, and give much the same effect as a volley. The weapons first used fired one hundred bullets each minute, but improved mechanism enables the newer types to fire ten times that number, and to give good results at ranges of 3000 yards. The barrels are of various calibres up to 12 inches; and larger sizes could be made. A few Gatling guns were used in the Franco-German war

of 1870, the Russo-Turkish war of 1877-78, the Chilo-Pernuvian war of 1877, and the British campaigns in Ashantee, Zululand, Egypt, &c.

The Montigny mitrailleuse, adopted by the French army, and used by them in large numbers during the campaign of 1870, consists of thirty-seven rifle-barrels permanently enclosed in an iron cylinder. These are all loaded simultaneously at the breach by means of a metal frame, in which the cartridges are carried, and can be discharged independently or all at once by the action of a crank-handle. Reloading takes five seconds, and ten discharges can be fired per minute. The bullets have no lateral spread, and the effective range is not much over 1000 yards. Numbers of these weapons were secretly manufactured in France previous to 1870, and, on the outbreak of war in that year, were issued to the artillery in place of their field guns, without any instruction having been given to the men in working them. Formed into batteries of ten pieces, they were expected to beat off both artillery and infantry; but the concentrated shell fire of the

Fig. 2.

Nordenfelt-Palmerantz Gun, inside Bulwark Mounting.

former destroyed them at long ranges, and the rapid movements of the latter often enabled them to capture the mitrailleuses without serious loss. The failure of this weapon brought all machine guns into dis-favour; but when protected from artillery fire in savage warfare, their great value for certain purposes, such as flanking the ditches of fortresses, defending defiles, bridges, &c., and naval operations, has since been fully recognised, and very many improved types have appeared.

The Nordenfelt-Palmerantz system (fig. 2) is particularly useful in the tops of ships. The 4 inch calibre gun, firing steel bullets, is capable of piercing the sides and boilers of torpedo boats at 300 yards. It consists usually of four or more horizontally arranged

Fig. 3. Five-barrelled Gardner Gun on Tripod Stand.

barrels, and the firing handle on being moved forwards and backwards discharges them all, if moved rapidly, in a succession of volleys, if slowly, in a succession of single shots. The number of aimed shots per minute fired at sea varies from one hundred with the 1-inch to ten with the 3-inch gun.

Fig. 3 shows another form of rifle-calibre machine gun designed by Captain Gardner, late U.S.A., for use with a field army. The operations of loading, firing, and withdrawing the empty cartridge-cases are performed automatically by the breech mechanism, worked by a crank-handle. The cartridges are fed in from an upright frame or carrier.

The Maxim automatic machine gun has a single barrel surrounded by an outer case, the space between being filled with water to prevent heating. The breech end of the gun recoils after discharge (the first cartridge being fed in and fired by hand), causing the arm B (fig. 4) to strike the fixed point C, thus imparting to the crank-shaft E a rapidly accelerated rotation, and making the crank-handle F strike the buffer-spring D, which brings it to a state of rest. The rotation of the crank-shaft E also rotates the fusee (shown dotted round E) attached to the chain, and thereby winds it up, so that, when the crank-handle F rests on the buffer D, the spiral spring (dotted) is not only extended 1 inch (due to the recoil), but further elongated by the winding up of the chain on the fusee. After

Fig. 4.—Breech Mechanism of Maxim Gun.

the crank-handle F has been brought to rest against the buffer D, the action of the spring is first to pull back the recoiling portion into the firing position, and then to unwind the chain from the fusee, thus rotating the crank-shaft back into its original position. The cartridges are carried on a broad linen belt, to which fresh lengths can be attached, and which is carried round by the mechanism. The accelerated motion of the crank draws back the lock sufficiently to allow the old cartridge to drop out, while the spiral spring causes the lock to come forward quicker than the recoiling portion of the barrel, so that at the same instant as the barrel resumes the firing position the lock closes the breech with a new cartridge and fires it, the recoil setting up the same action again. The gun may be arranged for firing single shots by hand on pressing a button, or to continue firing shots at any required interval of time. As many as 620 rounds per minute have been fired from this gun, and accurate shooting obtained up to 3000 yards. Fig. 5 shows a rifle-calibre Maxim gun, which, with its tripod, only weighs 70 lb. A 3-pounder gun has also been designed on the same principle. All the mechanism is carefully covered in to protect it from grit and dirt, but it can easily be taken to pieces and cleaned.

The Hotchkiss revolving cannon is similar to the Gatling gun, inasmuch as it consists of five barrels revolving round a central axis, but there is only one lock for all five, instead of one for each barrel, and the rotatory motion of the barrels is intermittent instead of continuous. Each turn of the crank-handle loads one barrel and fires another, while an empty cartridge case is being extracted from a third. The mechanism is in few parts, which are large, strong, and serviceable, with only one spring, and that a large flat one. The breech piece is solid.

The calibres of the revolving cannon vary from 1.5 inch to 2 inches, but the same inventor has made a 6-pounder quick-firing single-barrelled field-gun.

Fig. 5.—Rifle-calibre Maxim Gun.

The projectile is either a steel shot for naval purposes or an explosive shell. As many as eighty rounds per minute have been fired from the revolving cannon, the cartridges being fed in from a hopper frame, and good results obtained at a range of 5460 yards.

By an order of 1888, a detachment with two machine guns was made part of the war establishment of every brigade of infantry or cavalry in the British army. Each infantry detachment consists of an officer, two non-commissioned officers, and nine men, and is accompanied by a forage-cart and ammunition-cart carrying 6640 rounds for the guns, 1500 more being on each gun-carriage. Two men are sufficient to work each gun, the remainder are drivers and a servant. In the cavalry detachment there are fifteen men, of whom two are servants, seven drivers, and six for working the guns and to act as horse-holders. The ammunition-wagon carries 13,340 rounds of rifle-calibre cartridges.

The mitrailleuse form of machine gun thus takes a definite place in the armament of European troops, not as a substitute for field artillery, against which, if unprotected by cover, it can never stand, but as an auxiliary to infantry and to cavalry acting independently, in positions where rifle-fire is most efficacious. It will also be useful for long range rifle-fire, and perhaps in lieu of an infantry escort to guns when moving rapidly to the front, besides those purposes which have already been alluded to. The shell-firing machine gun and the quick-firing gun, on the other hand, will perhaps supersede the ordinary artillery pieces of similar calibre. The one-pounder-shell machine gun (called 'Pom-pom' by the soldiers, from its sound) proved of effectual service in the Transvaal war, 1899-1900.

Macintosh, CHARLES. See INDIA-RUBBER.

McIntyre, DUNCAN BAX. See GAFFLE, V. 52.

Mack, KARL, FRIEDRICH VON, Austrian general, was born at Neun-lingen, in Franconia, on 24th August 1752, entered the military service of Austria in 1770, and, after fighting in the Turkish war and against the French republican armies, was in 1797 created field-marshal. Having, after the peace of Campo Formio, been appointed by the king of Naples to the command of his troops, he took the field against the French, and occupied Rome; but he was unable to retain his hold of the city. A riot in the city of Naples, caused by his having concluded an armistice with the French, compelled him to seek safety in the enemy's camp. He was thereupon carried prisoner to Paris, but escaped in 1800. Five years later the emperor put him at the head of 80,000 men, and sent him to check the

French advance along the line of the Ille. But the enemy outmanœuvred him, and shut him up in Ulna, and on 17th October Mack capitulated with his army. He was tried by court-martial and condemned to death, but the sentence was commuted by the emperor to expulsion from the army and twenty years' imprisonment. In 1808 Mack was liberated, and in 1819 fully pardoned. He died 22d October 1822. His defence was published in Rammer's *Historisches Taschenbuch* (1873).

Mackay, CHARLES, LL.D., poet and journalist, the son of an officer in the Royal Artillery, was born in Perth in 1814. He was sent to school in London and Brussels, and showed an early fondness for verse-writing. In 1830 he became secretary to Cockerill (q.v.) at Seraing. The publication of a small volume of poems in 1834 led to his becoming assistant-editor of the *Morning Chronicle* (1835-44). From 1844-47 he was editor of the *Glasgow Argus*; he acted on the literary staff of the *Illustrated London News* (1848-59), and filled the post of New York correspondent of the *Times* during the civil war (1862-65). The *London Review*, a weekly journal which he established in 1860, was not a success. Down to the time of his death, December 24, 1889, he issued many volumes of poetry and prose, and was a contributor to *Blackwood's Magazine*, the *Nineteenth Century*, and other periodicals. Two of Mackay's songs, 'There's a Good Time Coming' and 'Cheer, Boys, Cheer,' had an extraordinary vogue, 400,000 of the first having been sold, without putting anything into his pocket. He published eleven volumes of poetry; *Gossamer and Snowdrift* (1890) was edited by his son Eric (1851-98); author of *Love-letters of a Violinist*, *Arrows of Song*, *Nero and Actea*, &c. His prose works included *Memoirs of Extraordinary Popular Delusions* (1841), a work on *Gaelic Etymology* (1878), and two works of literary autobiography, *Forty Years' Recollections* (2 vols. 1877) and *Through the Long Day* (2 vols. 1887).

M'Keesport, a borough of Pennsylvania, on the Monongahela River, at the mouth of the Youghiogheny, and on several railways, 15 miles S.E. of Pittsburg. It has flour, saw, and rolling mills, large manufactories of tubing, glass-works, a distillery, &c. Natural gas is used to some extent for fuel. Pop. 8212.

Mackenzie, ALEXANDER, Canadian statesman, was born in Logiehall, Perthshire, 28th January 1822, removed to Canada in 1842, and worked for some time as a mason, subsequently becoming a builder and contractor. In 1852 he became editor of a Reform newspaper. He represented Lambton in parliament from 1861 to 1867, and in the Dominion parliament till 1882; he was then elected for East York, and was re-elected in 1887. From 1867 he led the Reform opposition in parliament, and in 1873-80 was leader of the Liberal party in Canada. In 1873 he succeeded Macdonald, becoming the first Liberal premier, and remained at the head of the government till 1878. He thrice declined a knighthood, wrote the Life of his friend and ally, the Hon. George Brown (1882), and died 17th April 1892.

Mackenzie, SIR ALEXANDER CAMPBELL, composer, knighted in 1895, was born in Edinburgh in 1847. He studied music in Germany and at the Royal Academy, London. From 1865 to 1879 he was engaged in Edinburgh as teacher, violinist, conductor, and composer. Afterwards he resided in Italy, devoting his energy mainly to composition. In 1886 he had the degree of Mus. Doc. from St Andrews University; in February 1887 was appointed Principal of the Royal Academy of Music in London. His works embrace almost every form of music. His celebrity dates from the production

of his opera *Columba* in April 1883 at Drury Lane by the Carl Rosa Company. His subsequent opera, *The Troubadour*, had not the same success. His oratorio, *The Rose of Sharon*, produced at Norwich in 1884, is regarded as hitherto his best work. Another similar one, *The Lord of Life*, was composed for production in 1891 at Birmingham. Besides these, he has written several important cantatas; two Scotch rhapsodies, and other orchestral works, a concerto and a *piroch* for violin; chamber music, songs, pianoforte and organ pieces, &c. His compositions are distinguished by a manly solidity of workmanship, the result of a thorough mastery of all branches of his art, combined in many instances with a happy poetic inspiration. He is also eminent as a conductor.

Mackenzie, SIR GEORGE, a Scottish lawyer and statesman, nephew to the Earl of Seaforth, was born at Dundee in 1636. He studied at St Andrews, Aberdeen, and Bourges in France ('the Athens of Scottish lawyers'); in 1656 was called to the bar at Edinburgh; and in 1661 boldly defended the Marquis of Argyll on his trial for high-treason. About the same time he was made a justice-depute, and as such had to repair once a week at least to Musselburgh and Dalkeith, and to try and judge such persons as are there delated of witchcraft. He was soon after knighted, entered parliament as member for Ross-shire in 1669, and in 1677 was named king's advocate. Up to this point his career had been marked by a decidedly patriotic spirit, and he was even one of the most popular men in the country. In the midst of his professional labours he diligently cultivated literature, and was one of the first Scotchmen to write English with purity. 'That noble wit of Scotland,' Dryden terms him. Unhappily in the popular mind he is better known as criminal prosecutor in the days of the persecution, in which capacity he earned the title of 'Bloody Mackenzie'; nor can it be disproved, in spite of his liberal antecedents, that he became a willing instrument of despotism. In 1682 he founded the Advocates' Library (q.v.); at the Revolution, six years afterwards, he retired to Oxford. He died in London, 8th May 1691, and was buried at Edinburgh in Greyfriars-Churchyard.

His works, published between 1663 and 1686, and collected by Ruddiman (2 vols. folio, 1716-22), include *Religio Stoici*, *Moral Essay upon Solitude*, *Moral Gallantry*, *Vindication of the Government of Charles II.*, three treatises on the law of Scotland, and *Jus Regium*. See his *Memoirs of the Affairs of Scotland* (ed. 1821); and Taylor Innes, *Studies in Scottish History* (1892).

Mackenzie, HENRY, the 'Man of Feeling,' was born in Edinburgh, 26th August 1745. A physician's son, he passed from the High School to the university, in 1765 went up to London to pursue his law studies, and, returning to Scotland, became crown attorney in the Court of Exchequer, and in 1804 comptroller of taxes. For upwards of half a century he was one of the most illustrious names connected with polite literature in Edinburgh, where he died at the great age of eighty-five, on 14th January 1831. His *Man of Feeling* was published anonymously in 1771; *The Man of the World* followed in 1773, and *Julia de Rombou* in 1777. All three have something of Richardson, and more of Sterne, but nothing of their genius. The first, which alone is not wholly forgotten, which indeed was reprinted by Professor Henry Morley in 1886, is perhaps the most numby-pumby effusion that ever attained classical celebrity. His other writings include some Tory pamphlets, lives of Blacklock and Home, ninety-nine papers in the *Mirror* and *Lounger*, and four very weak plays. At least, he deserves recognition for his own

recognition of Burns, and as an early admirer of Lessing and of Schiller.

Mackenzie, WILLIAM LYON, Canadian agitator and journalist, was born in Dundee, 12th March 1795, emigrated to Canada in 1820, and in 1824 established the *Colonial Advocate*, first at Queenstown, then at Toronto. There his denunciations of the officials resulted in the partial destruction of his printing-office in 1826. In 1828 he was elected to the provincial parliament for York, but was expelled for libel on the Assembly, and was successively expelled and re-elected until finally the government refused to issue the writ. In 1832 he went to London with a petition of grievances from the Reformers of Canada, and while there secured the dismissal from office of the Attorney-general and Solicitor-general of Upper Canada. In 1834 he was elected the first mayor of Toronto, and in 1836 he started the *Constitution*, in which he attacked Sir Francis Head, the lieutenant-governor, for interference with the elections. In 1837 he published a virtual declaration of independence in his paper, headed a band of armed insurgents, and demanded of the lieutenant-governor a settlement of all provincial difficulties by a convention. This demand not having been granted, Mackenzie determined to arrest the lieutenant-governor and capture the military stores in Toronto; but being met by a superior force at Montgomery's Hill, 4 miles from the city, the insurgents were put to flight after a brief skirmish in which several were killed. Mackenzie and others effected their escape, and took possession of Navy Island in the Niagara River, where he established a provisional government. He was soon, however, compelled to break up his camp, and was afterwards sentenced by the United States authorities to twelve months' imprisonment in Rochester jail. On the proclamation of amnesty in 1849 he returned to Canada, and was a member of parliament from 1850 till 1858. Reforms more radical than those he contended for have since been granted. He died in Toronto, 28th August 1861. See the *Life* by his son-in-law, Charles Lindsay (2 vols. 1862).

Mackenzie River, in North America, has its origin, as the Athabasca (q.v.), in a Rocky Mountain lake in British Columbia, flows over 600 miles to Lake Athabasca, and 240 as the Slave River to Great Slave Lake (q.v.). It now assumes the name of Mackenzie River, and conveys the waters of the Great Slave Lake to the Arctic Ocean at Mackenzie Bay, after a final course which is reckoned at 1045 miles, making a total river-system of nearly 2590 miles. It drains an area of little less than 600,000 sq. m. The mouth of the river is closed from October to June by ice. The Mackenzie district itself is desolate and unfit for colonisation; but its great tributaries, the Liard and the Peace and Athabasca rivers, drain an immense fertile country, with abundance of petroleum (the fields have been reported the largest in the world), and some coal and lignite. The Mackenzie received its name from Sir Alexander Mackenzie (c. 1755-1820), by whom it was discovered in 1789. Sir John Franklin (q.v.) descended it in 1825. Since 1895 it gives name to a new north west territory of Canada.

Mackerel (*Scomber*), a genus of acanthopteran fishes of the family Scomberidae, which also includes the Tunny, Bonito, and Sucking Fishes. Members of the 'mackerel' family are pelagic forms of very extensive distribution. They are gregarious and predaceous, and are extremely active, the form of their bodies being eminently adapted for rapid gliding movements. Their muscles are richly supplied with blood and with nerves, and the temperature of their bodies is several degrees higher than in other fishes. The

genus *Scomber*, the mackerels proper, comprises seven species, distributed in almost all temperate and tropical seas, except off the American shores of the South Atlantic. The Common Mackerel (*S. Scomber*) is found as far south as the Canary Islands, and from Greenland to Cape Cod in Massachusetts. It is abundant off the British coast, is found in the Mediterranean, but is scarce in the Baltic. It is a very beautiful fish of elegant spindle-like shape. Its colour is a lustrous dark blue above, with wavy blackish transverse streaks and silvery below. The tail is crescent-shaped, and has a slight ridge or keel on each side. The snout is rather long, pointed, and compressed.

Common Mackerel (*Scomber Scomber*).

The mackerel is usually from 14 to 16 inches long, and about 2 lb. in weight, but it may attain a size of over 18 inches. Mackerels move about in shoals, approaching the coast at certain seasons either before or after spawning, or for purposes of feeding, following shoals of herrings, sprats, or pilchards, on which they prey. Their migrations are probably largely influenced by temperature. Early in the year they move from the deeper parts of the Atlantic towards the British coast. In May and June they are found off the Scilly Isles, whence some go up St George's Channel, but most proceed along the English Channel. They are very constant in the rate at which they travel during their migrations. The mode of capture varies with local circumstances. In spring and autumn drift-nets only are used; in summer, when the fish are near the shore, seine-nets are likewise employed. When the shoals are much broken up, hand-lines are used baited with various substances, such as a slip from another mackerel, a piece of a cuttle-fish, a thin rind of pork, worms, or indeed any glistening substance, such as a strip of coloured cloth moving quickly through the water. Hand-line fishing may be prosecuted at all hours of the day and night, but it is most successful in the morning and evening, and a smart breeze, termed a 'mackerel breeze,' is most favourable to its success. As food, the mackerel is very highly esteemed, but it taints very rapidly and loses flavour when kept. Owing to the rapidity of decomposition in hot weather, and the consequent injurious results to consumers, mackerel were allowed in 1698 to be sold in London either before or after divine service on Sundays, an enactment that appears not to have been repealed. The introduction of steamboats as 'carriers' instead of sailing-vessels has proved highly beneficial to the mackerel industry and to the general public. In the beginning of 1890 a first consignment of cured mackerel was sent from Cape Town to Princetown, Massachusetts. Off the south coast of England mackerel seem to spawn about May or June. Sars states that eggs are deposited some leagues from the shore and at the very surface of the waves, where large numbers of these fish may be met with engaged in spawning. The eggs float on the surface. In suitable circumstances the young grow rapidly.

Another species, the Spanish or Coly Mackerel (*S. colias*), is found in Europe in the Mediterranean,

rarely on the south coast of England, and occurs from Nova Scotia to Cape Hatteras. It attains a weight of 4 or 5 lb., and unlike the common mackerel possesses an air-bladder. The Seal (q.v.) is sometimes called Horse Mackerel; the Mackerel Midge is a small Rockling (q.v.).

Mackinaw. See MICHIGAN (LAKE).

McKinley, WILLIAM, twenty-fourth president of the United States, was born 29th Jan. 1843, at Niles in Ohio, and served in the Civil War, retiring in 1867 as major to Canton, where, after a period of study, he practised law. He was elected to congress in 1877, and repeatedly re-elected. In 1891 he was made governor of Ohio, his name having ere this been identified with the high protective tariff carried in the McKinley Bill of 1890, though subsequently modified by the Democrats in 1894. Chosen Republican candidate for the presidency in 1896, he conducted an exciting contest with W. J. Bryan, who advocated the cause of free silver, payment of debts in silver dollars, the repression of monopolies, and was understood to favour labour at the expense of capital. A large section of the Democrats, 'Gold Democrats' or 'Sound Money Democrats,' in spite of their dislike to McKinley's policy on many points (including his protective tariff), strongly supported him as against Bryan; and McKinley secured (November 1896) a majority of more than a hundred in the electoral college, being regarded as the representative of non-repudiation, a gold standard, and the interests of capital generally. For the war with Spain, see CUBA. In 1900 he again defeated Bryan by an even bigger majority.

Mackintosh. See INDIA-RUBBER.

Mackintosh, SIR JAMES, philosopher, was born at Aldourie in Inverness-shire, October 24, 1765. Having studied at King's College, Aberdeen, and then medicine at Edinburgh, he settled in London, for some time supporting himself and his young wife by writing for the newspapers. The first work that brought him into notice was his *Vindictive Gallia* (1791), in reply to Burke's *Reflections on the French Revolution*. Fox, Sheridan, and other leading Whigs sought the author's acquaintance; and when the association of the 'Friends of the People' (q.v.) was formed he was appointed secretary. He was called to the bar in 1795, and ere long attained high eminence as a forensic lawyer. In 1799 he delivered a brilliant series of lectures on the law of nature and of nations before the benchers of Lincoln's Inn; and his defence of Peltier (1803), charged with a libel on Bonaparte, was a splendid triumph. In 1804 he was knighted, and appointed recorder of Bombay, and in 1806 judge of the Admiralty Court; here he spent seven years, entering parliament on his return as Whig member for Nairn (1813). He was professor of Law in the college of Haileybury from 1818 to 1824, and in 1830 became a member of the Board of Control under the Grey ministry, and spoke in favour of the Reform Bill. He died not long after, on the 22d May 1832. His *Dissertation on the Progress of Ethical Philosophy* (1831), written for the *Encyclopædia Britannica*, although very incomplete, shows the admirable powers of the author. For Lardner's *Cyclopædia* he wrote a brief but excellent survey of the History of England. A mere fragment of a great projected work, entitled *A History of the Revolution in England in 1688*, appeared after his death.

A collection of Mackintosh's miscellaneous works was published in 3 vols. in 1854. See the *Memories* by his son (2 vols. 1835), and the essays of Macaulay and De Quincy.

Macklin, CHARLES, actor, was born 1st May 1690, according to his biographer (Macklin used to say in 1699), the son of an Irish gentleman name,

McLaughlin, who commanded a troop of horse for King James at the Boyne two months later, and lost his estates in consequence. After a wild, unsettled youth, in which he was by turns potboy, college servant, and stroller, he played for a number of years in Bristol and Bath, till his brogue was worn down, and in 1733 was engaged for small parts at Drury Lane. He steadily rose in the public favour, till in 1741 he appeared in his great character, Shylock: Pope said of it, 'This is the Jew that Shakespeare drew.' From this time he was accounted one of the best actors, appearing with nearly equal success in tragedy or comedy, in passion or buffoonery, for nearly half a century. His last performance was at Covent Garden in May 1789, when he broke down; but he survived, with an annuity of £200, till 11th July 1797. He was generous, high-spirited, and honourable, but somewhat irascible: in 1735 he killed a brother-actor in a quarrel over a wig, and was tried for murder; and frequently afterwards he was engaged in disputes and actions at law. He wrote a tragedy, and several farces and comedies: of these *Larcibus Mæde* (1759) and *The Man of the World* (1781) have been printed; in the latter his own part was Sir Pertinax MacSycophant. See his *Memoirs*, by J. T. Kirkman (2 vols. 1799), and the Life by E. A. Parry (1891).

Macknight, Dr JAMES, an eminent divine of the Church of Scotland, was born at Irvine, in Ayrshire, 17th September 1721; studied at Glasgow University, and afterwards at Leyden, in Holland; and in 1753 was ordained minister of the parish of Maybole. In 1769 he was translated to Jedburgh, and thence to Edinburgh in 1772, where he died, 13th January 1800. Macknight was a superior scholar, a liberal, wise, and prudent ecclesiastic, and a respectable writer on Scripture subjects. His principal works are *Harmony of the Four Gospels* (1756); *The Truth of the Gospel History* (1763); and *A New Translation of the Apostolical Epistles, with Commentary and Notes* (1795).

Mackonochie, ALEXANDER HERRIOT, priest, was born at Fareham in Hampshire, 11th August 1825, the son of a Scotch East Indian colonel. He was privately educated at Bath and Exeter, studied awhile at Edinburgh University, and in 1845 went up to Wadham College, Oxford. In 1848 he took a second-class in classics, and next year was ordained to a curacy at Westbury, removing in 1852 to Wantage, and in 1858 to St George's-in-the-East. In 1862 he became the first vicar of St Alban's, Holborn—the small but crowded slum where for twenty years he did a great work that lives after him. His prosecution (or persecution) by the Church Association for ritualistic practices commenced in 1867; and at last in 1882, in accordance with the dying wish of Archbishop Tait, he sought to withdraw from further conflict by resignation. He accepted the charge of St Peter's, London Docks; that, too, a twelvemonth later he had to resign. His health broke down; and on 15th December 1887, during a visit to the Bishop of Argyll at Ballachulish, he lost his way in the Mamore deer-forest, and was found two days later lying dead in the snow, a deerhound and a Skye terrier guarding him. He rests in the St Alban's burial-ground at Woking. See his Life by Mrs Towle (1890).

Maclaurin, COLIN, mathematician, was born at Kilmodan, Argyllshire, in 1698. He graduated M.A. at Glasgow in 1713, and four years later obtained the professorship of Mathematics in Marischal College, Aberdeen. In 1719 he visited London, and was admitted to the Royal Society. Here he published his *Geometria Organica* (1719), an elaborate treatise on the description of curves.

He afterwards visited France as tutor to Lord Polwarth's son, and while there wrote a dissertation on the percussion of bodies, which gained the prize of the Academy of Sciences in 1724; while sixteen years later he divided with Euler and Bernoulli its prize for an essay on the flux and reflux of the sea. The following year he was appointed, on the recommendation of Newton, assistant to James Gregory, professor of Mathematics in the university of Edinburgh, and soon after succeeded him in the chair. In the labour of preparing trenches and barricades to defend Edinburgh against Prince Charlie's army he took too active a share for his health, and died of dropsy June 14, 1746. Maclaurin's writings gave a strong impetus to the study of mathematical science in Scotland. His *Treatise on Fluxions* (1742), written in defence of Newton's discoveries against the attack of Berkeley, was the first work in which the principles of fluxions were logically arranged, and formed a contribution of the greatest importance to the theory of the tides and the figure of the earth. The *Treatise on Algebra* (1748) was left incomplete, as was also the *Account of Sir Isaac Newton's Philosophical Discoveries* (1748), containing explanations of all Newton's discoveries, the optical ones excepted. Many papers appeared in the *Philosophical Transactions*.

Maclé, a term employed in mineralogy to designate what are also called *twinned crystals*, which are crystals united according to some precise law, yet not having their faces and axes parallel, so as to render the one a mere continuation of the other. In some maclés the axes are parallel; in some, they are inclined at an angle. Crystallisation in maclés is very characteristic of some minerals.—*Maclé* is also the name of the variety of Andalusite (q.v.) called Chistolite, a silicate of alumina, containing a little magnesia and oxide of iron. Maclé has been much used for making beads for rosaries, &c.

M'Lennan, JOHN FERGUSON, a strikingly original and suggestive writer on primitive civilisation, was born at Inverness, 14th October 1827. He graduated at King's College, Aberdeen, in 1849, and then proceeded to Trinity College, Cambridge, which he left in 1853 to join the Scottish bar in 1857. But he cut short the practice of his profession in his zeal for the study of the usages and customs of early civilisation. The chief fruit of his labours appeared in *Primitive Marriage* (1865), in which he emphasises the importance of the patriarchal theory of marriage amongst savage peoples, and in papers in the *Fortnightly Review* (1869-70) on totemism. His book, after being enlarged and the argument strengthened by new evidence, was issued under the new title of *Studies in Ancient History* in 1876. M'Lennan further defended his views as against the patriarchal theory of Sir Henry Maine in *The Patriarchal Theory*, left incomplete at the author's death, but finished and edited by his brother Donald in 1885. He also wrote a *Life of Thomas Deaconmond* (1867) and papers on 'The Levirate and Polyandry' (1877). Draftsman of parliamentary bills for Scotland in 1872-75, he died 16th June 1881. A second series of *Studies in Ancient History*, edited by his widow and A. Platt, appeared in 1896.

Macléod, NORMAN, a divine of the Church of Scotland eminent for his pulpit oratory, his writings, and his liberal Christianity, the son of a parish minister, was born at Campbeltown, Argyllshire, June 3, 1812. He was educated at Campbeltown and Campsie, to which his father had been translated, attended Glasgow University, and entering the church became minister of London, in Ayrshire (1838-43); of Dalkeith (1843-45); and of

the important Barony Church, Glasgow, from July 1851 till his death, June 16, 1872. He received the degree of D.D. in 1858, and was appointed one of the Queen's Chaplains in Scotland, the Queen valuing highly his sermons, sympathy, and advice. An utterance of his on the Sabbath question in 1865 started his brethren and the public, and he was threatened with prosecution; but wiser counsels prevailed. In 1869 he was moderator of the General Assembly, and was designated Dean of the Chapel Royal and Chaplain of the Order of the Thistle. In 1845 he visited Canada as a church deputy; he was in Palestine in 1864-65, and in India in 1867, on mission business for the Church of Scotland. One of the most eloquent and powerful addresses he ever delivered was that on missions before the General Assembly, after his return. From 1850 to 1859 Macléod edited the *Edinburgh Christian Magazine*, for a year the *Christian Guest* (1860), and from 1860 till 1872 *Good Words*, to which he contributed tales, essays, verses, sermons, most of which were reprinted in book-form. Full of healthy life and human sympathy himself, his writings show shrewd observation, lively description, and good-humour; his tales are lacking on the constructive side. He possessed a large, simple, childlike nature, full of tenderness, and was broad and catholic in his sympathies, which bound him to humanity at many points. He published *The Earnest Student* (1854), *Deborah* (1857), *Daily Meditations* (1861), *The Gold Thread* (1861), *The Old Lieutenant* (1862), *Parish Papers* (1862), *Wec Dara* (1864), *Simple Truth* (1866), *Eastward* (1866), *Reminiscences of a Highland Parish* (his grandfather's parish of Morven, 1867), *The Starling* (1867), *Peeps at the Far East* (1871). See *Memoir* (1876) by the Rev. Donald Macléod, and articles by Strahan (*Contemporary Review*, July 1872) and Dean Stanley (*Good Words*, 1872).

Maclise, DANIEL, painter, the son of a Highland soldier named McLeish, was born at Cork in January 1806 (not 1811) and baptised 2d February, entered the school of the Royal Academy, London, in 1828, soon exhibited at the Academy, and in 1833 made himself famous by his 'All-Hallow Eve.' His later pictures are many of them familiar by engraving such as 'The Banquet Scene in Macbeth' and 'Scene from Twelfth Night' (1840), 'Play Scene in Hamlet' (1842), and his design of 'Shakespeare's Seven Ages' (1848), 'The Gross of Green Spectacles' (1850), 'Caxton's Printing-office' (1851). The frescoes—each 45 feet long and 12 feet high—in the Royal Gallery of the House of Lords, depicting 'The Meeting of Wellington and Blücher on the Evening of the Battle of Waterloo' and 'The Death of Nelson at Trafalgar,' were admitted to be the finest mural paintings hitherto executed in Britain. Numerous good engravings of them are current. The most noteworthy pictures exhibited by Maclise, after the completion of these great works, were 'Othello,' 'Desdemona,' and 'Opheelia' (1867), 'The Sleep of Duncan' and 'Madeline after Prayer' (1868), 'King Cophetua and the Beggar Maid' (1869), 'The Earls of Desmond and Ormond,' posthumously exhibited in 1870, in which year he died on 1st April. The sketches by him of his contemporaries, published in *Fraser's Magazine* during 1830-38, were republished in 1874 and 1883. See the *Memoir* by O'Driscoll (1871).

Macmahon, MARIE EDMÉ PATRICE MAURICE DE, Duke of Magenta, marshal of France, descended from an Irish Jacobite family, was born at Sully, near Antun, 13th June 1808. Entering the army, he saw much active service in Algeria, especially distinguishing himself at the storming of Constantine (1837), commanded the

division that stormed the Malakoff at Sebastopol in 1855, and took a conspicuous part in the war against the Kabyles in Algeria (1857-58) and in the Italian campaign of 1859, winning a marshal's baton and the dignity of Duke of Magenta for the decisive part he took in the battle of that name. He was nominated governor-general of Algeria in 1864. In the Franco-German war of 1870-71 he had command of the first army corps, but was defeated at Wörth, and wounded and captured at Sedan. On the close of the war he was made commander of the army of Versailles, with which he suppressed the Commune. In 1873 he was elected president of the republic for a period of seven years, with some hope that the restoration through him of the Bourbons might be secured. For his sympathies were, and continued to be, conservative, and at times reactionary, and, although he pursued no aggressive policy, he gradually became estranged from the Republicans. Rather than dismiss some of his old comrades in arms he preferred to resign, 30th January 1879. He afterwards lived in retirement, and died 17th October 1893.

Macmillan, DANIEL, was the son of a small farmer, and was born at Upper Corrie, Arran, 13th September 1813. His brother Alexander was born at Irvine, 3d October 1818, survived Daniel for nearly forty years, and died 25th January 1896. After serving a seven years' apprenticeship (1824-31) under a book-seller at Irvine, Daniel went to Glasgow in 1831; was engaged with Johnson, Cambridge (1833-37), and with Seeley, London (1837-43). He was joined by his younger brother Alexander, who had been keeping a school at Nitshill, near Paisley, and a small shop in Aldersgate Street in London was opened under his charge in 1843. Partly through the kindly interest of Archdeacon Hare the business of Mr Newby, Cambridge, was taken over by the brothers in the same year, and Mr Stevenson's business there was acquired for £6000 in 1845, with the assistance of fresh partners. As the brothers showed insight and knowledge of books their business grew rapidly, and by 1856 success was secured. The books that helped the young firm most largely were the works of Kingsley, Maurice, and the educational and university volumes. Daniel died 27th June 1857. He had a high ideal of the book-selling business: 'As truly as God is, we are his ministers and help to minister to the well-being of the souls of men.' Alexander Macmillan (1818-96) was appointed publisher to Oxford University in 1863, and in the same year the business was removed to London. *Macmillan's Magazine* first appeared in 1859, and now the catalogue of the firm embraces works by the most eminent names of the day in all departments of literature. See the Life by F. Hughes (1882).

Macmillanites. See CAMERONIANS.

Mâcon (*Matisco* of Caesar), the capital of the French department of Saône-et-Loire, on the right bank of the Saône, 41 miles by rail N. of Lyons. A dull, modernised place, it has a twelve-arch bridge, with a view of Mont Blanc; a fragment of an old cathedral, demolished at the Revolution; the fine Romanesque church of St Pierre (rebuilt 1866); and a statue of Lamartine, who was born here. It carries on an extensive trade in wines known as Macon, like but lighter than Burgundy, as well as in corn, cattle, &c., and has manufactures of watches, brass, faience, &c. Pop. (1872) 16,614; (1891) 18,497.

Macon, capital of Bibb county, Georgia, on the Ocmulgee, stands among forest-clad hills, at the head of navigation, 103 miles SSE. of Atlanta, on six lines of railway. It is the seat of Mercer University (Baptist), a Roman Catholic college, a Wesleyan girls' school, and an academy for the

blind; has several foundries, flour and lumber mills, cotton factories, &c., and ships large quantities of cotton. Pop. (1880) 12,749; (1890) 22,746.

Macpherson, JAMES, notorious as the 'translator' of the Ossianic poems, was born in 1738 at Ruthven, in Inverness-shire. After finishing his studies at King's College, Aberdeen, he became a schoolmaster in his native village, published a poem entitled the *Highlander* in 1758, contributed about the same time verses to the *Scots Magazine*, and in the following year, having met with 'Jupiter' Carlyle and John Home, the author of *Douglas*, he showed them some fragments of Gaelic verse, with 'translations' of the same. These (sixteen in number) appeared in 1760, and excited so much interest that the Faculty of Advocates in Edinburgh subscribed money to send Macpherson on a tour through the Highlands for the purpose of collecting more of the same. The quest was successful, but the unsatisfactory statements of Macpherson about his originals and the place where he made his discoveries excited grave and well-grounded suspicions. Some MSS. undoubtedly he found, but what he published as their contents was something very different from these. The result of his labours was the appearance at London, in 1762, of the so-called poems of Ossian (q.v.), under the title of *Fingal, an Epic Poem, in Six Books*; and in 1763, of *Temora, an Epic Poem, in Eight Books*. A storm of controversy soon arose in regard to their genuineness, which can hardly yet be said to have entirely subsided, although the general verdict is one unfavourable to Macpherson. Dr Johnson's vigorous denunciation of the imposture so inflamed Macpherson that he threatened personal violence to the old man, who replied with characteristic fearlessness: 'Any violence offered me I shall do my best to repel; and what I cannot do for myself, the law shall do for me. I hope I shall never be deterred from detecting what I think a cheat by the menaces of a ruffian.' These poems were, however, the making of Macpherson in a worldly point of view. He was appointed in 1764 surveyor-general of the Floridas with a salary for life, and in 1779 agent to the Nabob of Arcot—a very lucrative office; entered parliament in the following year as member for Camelford, sat for ten years, and then retired to the estate of Bellville which he had purchased in Inverness-shire, and where he died February 17, 1796. His body was actually interred at his own request and expense in Westminster Abbey. He wrote historical compilations, and a wretched prose translation of the *Hoad*. See his *Life and Letters* by Bailey Saunders (1894).

Macquarie, a tributary of the Darling (q.v.), a river and a port of Tasmania, a port in New South Wales, and a small island in the South Pacific; from General Lachlan Macquarie, governor of New South Wales from 1809 to 1821.

Macrauchenia (Gr., 'long-necked'), a genus of South American fossil herbivorous animals, forming a connecting-link between the Palæotherium (q.v.) and the camel family. In form they nearly resembled the llama, but were as large as a hippopotamus.

Macready, WILLIAM CHARLES, actor, was the son of William McCready (so he spelt his name), actor and provincial manager. His mother, whose maiden name was Birch, was an actress. While the elder Macready was fulfilling an engagement at Covent Garden, William Charles was born in Mary Street, Easton Road, on 3d March 1793. In 1795 his father became manager of the Birmingham Theatre, and Macready was sent to Rugby, where he entered in 1803. He was intended

for the bar; but his father's managerial speculations proving unsuccessful, he was forced to adopt the stage as his profession. He made his first appearance at Birmingham on 7th June 1810, playing Romeo, and for six years remained in the provinces. On 16th September 1816 he made his London debut, playing Orestes (*Distress Mother*) at Covent Garden. His reception by the critics and public was friendly; but he was for a long time very unfortunate in being cast for unsympathetic parts, one of the few exceptions being *Rob Roy*, in which he made a great hit, and of which he was the original actor in London. For many years he fought a fairly equal fight against Kean, Young, and Charles Kemble; but it was not till 1837 that he really took his position as leading English actor. On 30th September 1837 he inaugurated his famous Covent Garden management, during which he did much good service to the English stage. Surrounded by such players as Miss Faucit, Samuel Phelps, James Anderson, Mr and Miss Vandenhoff, Miss Priscilla Horton, and Mrs Warner, he produced Shakespeare's plays in worthy fashion, and did much to elevate and reform the theatre. For two seasons he managed Covent Garden, but abruptly gave it up; then, after two years' interval, took Drury Lane, which he managed from December 1841 to June 1843. After this time he never settled in London, but played in the provinces, in Paris, and in America. His last visit to the United States was marked by the terrible riots which arose out of the ill-feeling borne by the American actor Forrest to Macready. A riotous mob trying to break into the Astor Place Theatre for the purpose of maltreating Macready was fired upon by the military, and some twenty lives were lost (10th May 1849). On 26th February 1851 Macready took his farewell of the stage, at Drury Lane, in his great part of Macbeth, and passed his remaining years in placid retirement at Sherborne, Dorsetshire, and at Cheltenham, where he died on 27th April 1873. As an actor Macready endeavoured to combine the dignity of the Kembles with the naturalness of Kean. If not of the first rank, he was yet an actor of great power, and specially distinguished himself in Macbeth, Lear, Iago, King John, Cassius, and Henry IV. In Virginius, Werner, Richelieu, and Claude Melnotte he was also greatly successful.

See Macready's *Reminiscences and Diary* (1875); Lady Pollock's *Macready as I knew Him* (2d ed. 1885); and a memoir by William Archer ('Eminent Actor,' series, 1890).

Macrobius, AMBROSIVS THEODOSIVS, a Latin grammarian who flourished about the beginning of the 5th century. He appears to have been by birth a Greek, but literally nothing whatever is known of his life, not even whether he was a Christian or a pagan. Two of his works are extant—a commentary on Cicero's *Somnium Scipionis*, and *Saturnalia Convivialium Libri Septem*, a series of historical, mythological, antiquarian, and critical dialogues at third hand. There are editions by Jan (1848-52) and Eysenhardt (2d ed. 1893), and studies by Linke (1880) and Wissowa (1880).

Macrocosm. See MICROCOSM, PARACELSUS.

Macroon, a market town of Ireland, on the Sullane, 24 miles by rail W. of Cork. Pop. 3099. Near Macroon is a seat of the Earl of Bantry, constructed out of an old castle of King John's time.

Mactra, a genus of bivalve molluscs, with somewhat triangular equal-valved shells. They are active animals, ploughing their way through the sand either on the shore or at slight depths, and are able like cockles to take considerable leaps. Two common North American species, *M. solida* and *M. aculis*, known as hen-clams, surf

clams, &c., are sometimes eaten, while some small

Mactra.

British species—e.g. *M. subtruncata*—are said to be gathered for feeding pigs.

MacWhirter, JOHN, artist, was born in 1839 near Edinburgh. Apprenticed early to a bookseller and publisher, he ran away in disgust, and commenced his artist's life. His early studies of wild-flowers at home and abroad were selected by Ruskin as examples for his Oxford class. In 1864 he was elected Associate of the Scottish Academy, in 1879 A.R.A., and in 1893 R.A. He excels in depicting Highland scenery, but one of his most admired works is a view of Constantinople and the Golden Horn (1889). As favourites among his numerous pictures may be mentioned 'The Vanguard,' 'The Lady of the Woods,' 'The Three Graces,' and 'Out in the Cold.'

Madagascar, the third largest island in the world, is situated to the SE. of Africa, and is about four times as large as England and Wales. It is in 12° 2'—25° 35' S. lat. and 42°—51° 40' E. long.; length, 978 miles; greatest breadth, 350 miles; area, about 230,000 sq. m. Although frequently visited by Europeans since the beginning of the 16th century, Madagascar is yet but imperfectly explored. The coasts were carefully surveyed by Captain W. F. W. Owen, R.N., 1823-25; but until lately there has been a great lack of accurate knowledge as to the geography of the interior. Much light has, however, been thrown upon this by a distinguished French savant, M. Alfred Grandidier, who, between 1865 and 1870 explored the island and crossed it in several directions. Since then numerous journeys have been made by members of the London Missionary Society and other missions at work in the country; and the information thus obtained was embodied in a large map of Madagascar prepared in 1879 by Rev. Dr Mullens. A later map, brought up to the present state of our knowledge of the island, was issued in 1889 by Pere Roblet, S.J.

Madagascar consists, as regards its physical geography, of two great divisions—viz. (1) an elevated interior region, raised from 3000 to 5000 feet above the sea; and (2) a comparatively level country surrounding the high land, not much exceeding 600 feet in altitude, and most extensive on the west and south, although there are very lofty mountains extending to the south-eastern extremity of the island. The first of these is composed chiefly of Primary (gneiss and other crystalline) rocks, with enormous quantities of red clay-like earth, consisting of decomposed gneiss. It is a mountainous region, there being very little level ground except in the river-valleys, and some extensive and fertile rice-plains, the dried-up beds of ancient lakes. This interior highland comprises nearly half the total area of the island, and, although central, lies more to the north and east, the watershed running down the eastern side of the island at no great distance from the coast. From this upper region rises the highest mountain-mass, that of Ankaratra, probably an ancient volcano, whose summits are nearly 9000 feet above the sea-level. The lower region of Madagascar is fertile and well wooded,

especially on the eastern side of the island, though a large district in the south is barren. The western side appears to consist of secondary strata of the Cretaceous and Jurassic periods, and here the extensive plains are broken up by three prominent lines of mountain running north and south. From the south-east to the north-west and north a probably almost continuous series of extinct volcanic craters has been traced. These are very numerous near Lake Itasy (19° S. lat. and 47° E. long.), and also in the Betáfo district, about 50 miles farther south. There are hot springs in many parts of the island. The chief rivers flow west and north-west, and there are many fine bays and harbours on the north-west coast. The largest lake is the Alaotra in the Antsihánaka province, and a remarkable chain of lagoons extends for about 300 miles along the east coast, south of Tamatave, needing only about 20 miles of canal to connect them all into a continuous waterway.

All round the island is a nearly unbroken belt of dense forest, varying from 10 to 40 miles across, and most largely developed in the north-east. The flora of Madagascar is, therefore, very rich and varied, and contains large numbers of trees producing valuable timber, concessions for working which have lately been granted to several European companies. The flora is divided by Rev. R. Baron, F.L.S., into three regions, the eastern, central, and western, the central region including the elevated interior plateaus. Amongst the most characteristic forms of vegetation are the Traveller's Tree (*Ravennia madagascariensis*), the Roftia Palm (*Raphia ruffia*), the Lace-leaf (*Ocrotandra fenestralis*), the Beef-wood Tree (*Casuarina equisetifolia*), several species of pandanus and bamboo, and numerous peculiar orchids and ferns. Three-fourths of the species and one-sixth of the genera of the plants are endemic to Madagascar, showing (besides other facts to the same effect) that the island is of very great antiquity. About 4100 indigenous species are now known in Madagascar, and there is one natural order, Chlanaceæ, with twenty-four species, confined to the island.

The fauna of Madagascar contains several exceptional and ancient forms of life, comprising many species and even genera known nowhere else; but, considering its proximity to Africa, the country is markedly deficient in the larger carnivora and in ungulate animals. It is specially the home of the Lemuride, there being about thirty species of this family of Quadrumina, including the very curious Aye-aye (q.v., *Chiromys madagascariensis*). It is also the chief habitat of the chameleons, and especially of those species with curious processes on the head, about half of all the known species in the world being found in the island. About 240 species of birds are found in Madagascar, and of the 150 land-birds 35 genera and 129 species are peculiar to it, many of them being unlike any other living forms and of remote affinities. The remains, in a sub-fossil state, of an immense struthious bird (*Epporais maurinus*), as well as of some smaller allied species, have been found in several places on the southern coast, together with its eggs, the largest known (12½ in. × 9 in.). Fossil remains of gigantic tortoises have also been discovered, as well as of an extinct hippopotamus, but smaller than that now living in Africa.

The Malagasy people appear to be mainly derived from the Malayo-Polynesian stock, with which they have numerous affinities; and they have numerous points of connection with the Melanesian tribes, from which the darker element in the inhabitants of Madagascar is probably derived. There is also an admixture of African blood, especially on the western side of the island; and there is an Arab element both on the north-

west and south-east coasts. It is further believed that there are traces of an aboriginal race called Vazimba, who appear to have been driven out of the central provinces by the Hova, and whose descendants are still found in one part of the west coast. Accounts are also given of a tribe of people who live in the woods, chiefly on the trees. The Hova, the most advanced, civilised, and intelligent Malagasy tribe, inhabiting the central province of Imérina, and, since the beginning of the 19th century, the dominant race, are probably the latest immigrants and the purest Malayan in origin. Other important tribes are the Bet-sileo (southern central), Bára (still farther south), Tanála (south-east forest), Betsimisáraka (east coast), Sihanaka (north-east central), and Sakaláva (along the entire west coast). The eastern and western coast tribes have numerous subdivisions. All the coast peoples appear to be closely connected with each other in language; but, although there are many dialectic differences, the language of the whole country is substantially one, and is evidently nearly allied to those of the Malayan and Melanesian islands. The population of Madagascar is variously estimated at from 2,500,000 to 5,000,000; probably it is intermediate between these two figures.

The Malagasy, not having had their language reduced to a written form until the early part of the 19th century, have no ancient literature; but their numerous proverbs, songs, fables, and folk-tales, and their oratorical abilities, as well as the copiousness of their language, give ample proof of their intellectual acuteness. In their heathen state they are very immoral and untruthful, and cruel in war; but they are also courageous, affectionate, and firm in friendship, kind to their children and their aged and sick relatives, obedient to the law and loyal, very courteous and polite, and most hospitable. While retaining some traditions of a Supreme Being, they practised (and, except in the more enlightened parts of the central provinces, still practise) a kind of fetichism, together with divination, curious ordeals, and ancestor-worship.

The capital, Antanárivo, is situated centrally in the island, but nearer the eastern side. It has a population of about 100,000, and contains many large and handsome buildings, including the royal palaces, residences of the prime minister and chief nobles, four stone memorial churches, as well as many others of brick belonging to the London Missionary Society, Anglican and Roman Catholic cathedrals, several colleges and high schools, hospitals and dispensaries, an observatory, court of justice, mission printing presses, &c. The chief ports are Tamatave, on the east coast, and Mojangá, on the north-west. Ambohimanga in Imérina, and Fianarantsoa in Betsileo, are important places in the interior.

The principal exports (£165,000 per annum) of Madagascar are cattle, hides, gum-copal, india-rubber, rafia bast, and rice, and, more recently, ebony and other valuable woods; coffee, sugar, and vanilla are also being cultivated by Creole settlers. The chief imports (£162,000 per annum) are cotton goods, ironmongery, crockery, and rum. The principal trade is from the eastern ports to Mauritius and Reunion, and there is also now an increasing trade from the western side of the island with the South African colonies. The soil of the coast plains, especially of the eastern side, is fertile, and could supply large quantities of all tropical productions. Iron is abundant, especially as magnetite, and also as hematite and ironstone, and the Malagasy are skilful in the smelting and working of this as well as other metals. Copper apparently exists in great quantity in certain districts, and there also tin is said to be found. Galena is found abundantly near Mount Ankaratra, and from

this lead for bullets is obtained, and silver is being extracted from it. Gold of excellent quality has recently been found in many parts of the interior, and is now being worked by foreign capitalists as well as by the native government. Sulphur occurs in beds near some of the extinct volcanoes. There are as yet no roads or wheeled vehicles in Madagascar, so that the country is in some respects very backward, although there is no lack of manual skill among the people, who excel in weaving, in straw-work, and in carpentry, as well as in the working of gold and silver.

Madagascar was known to the early Greek geographers Ptolemy, Arrian, and Marcian under the name of *Mantliosis*; and the Arabian geographer Ebrisi apparently describes it under the name of *Chechezat*. The island was certainly known to and visited by Arab merchants at least a thousand years ago, and settlements were formed by them, as well as by Indian traders, in very early times; indeed the Arabs have left indelible traces of their influence upon the language, civilisation, and superstitions of the Malagasy. Madagascar is first mentioned under its present name by Marco Polo as *Madaigascar* or *Mogastar*; but the first European who saw the island appears to have been the Portuguese Fernam Soares in 1506. To the Portuguese, accordingly, was owing the name by which Madagascar was long known in European maps, *São Lourenço*, but they made no permanent colony there. The Dutch formed settlements for a short time; and the French made persistent efforts for nearly two centuries to maintain military posts on the east coast, but without any permanent success. But they still retain the little island of Ste Marie (east coast); in 1840 they obtained the island of Nosibe (north-west coast); and in 1883 they went to war with the Malagasy on various pretexts, hostilities being carried on in a desultory fashion for about two and a half years. Eventually a treaty was concluded by which the Bay of Diego Suarez, at the extreme north of Madagascar, was ceded to France, together with the right to place a Resident and other officers at the capital, and other officials at various ports and other places. In 1890 the English government formally acknowledged the French protectorate of Madagascar, but this has never been agreed to by the Malagasy government, and will probably not be acknowledged by them.

Up to the middle of the 17th century Madagascar was divided into a number of independent chief-taincies; about that time, however, the warlike Sakalava made themselves masters of the western half of the island, as well as of several interior provinces. But in the early part of the 19th century the Hova, led by two energetic chiefs, Iamboasalama, afterwards known as Andriamponimerina, and his son Radama I., threw off the Sakalava yoke, and with the aid of English arms and discipline, made themselves virtually kings of Madagascar. They conquered the eastern, north-western, and central provinces; but the Hova authority is still only nominal in some parts of the island. (In 1889, however, the turbulent tribes of the south-west were brought into submission.) Radama abolished the export slave trade, and gave encouragement to English missionaries, who commenced work at his capital in 1820. They reduced the language to writing, gave the people the beginnings of a literature, formed numerous schools, founded Christian churches, and introduced many of the arts of civilised life. But the accession of Queen Ranavalona I., in 1828 gradually led to repressive measures; the missionaries were obliged to leave in 1836, and a severe persecution of the native Christians ensued, in which numbers perished. Europeans generally were also for some time excluded from the island. The queen's decease in

1861 put an end to this period of terror, and Madagascar was reopened to Europeans at the accession of her son Radama II. Owing to the young king's follies and to intrigues with the French he was put to death in 1863, and his wife Rasoherina placed on the throne. During her reign (1863-68) steady advances were made, and treaties of commerce concluded with England, France, and America. Queen Ranavalona II., who succeeded, and her husband, the prime-minister, identified themselves with Christianity, which was becoming an important power in the country. The queen and her husband and many of the nobles were baptised; and the burning of the royal idols in the following year (1869) caused almost the whole population of the central provinces of Imerina and Betsileo to put themselves under instruction. Since that time about 1600 Protestant Christian congregations have been formed, together with about 1300 schools, with 100,000 scholars, and 280,000 adherents. (It is difficult to obtain any reliable statistics of the Roman Catholic mission; probably their numbers amount to about a fifth or sixth of the above, while of the preceding figures about five-sixths belong to the united missions of the London Missionary Society and the Friends, the others to the Norwegian Lutheran and the English Episcopal missions.) Several colleges and training institutions, as well as hospitals and dispensaries, have been established; and the mission presses issue about 220,000 copies annually of various publications. In 1879 all the African slaves in the country were set free. Queen Ranavalona III., born in 1862, succeeded in 1883. After the accession of Ranavalona III. in 1883, the French pressed claims to a protectorate, which after the occupation of Tamatave were in 1885 conceded. Difficulties led finally to the French expedition in 1895, which, after fearful losses from fever and imperfect commissariat, forced its way to Antananarivo, with almost no resistance from the Hovas. The French protectorate and France's right to military occupation were fully acknowledged. But the French failed to acquire full control over the island, and in 1896 a military governor superseded the civil governor.

Ellis (q.v.); the present writer's *Madagascar and its People* (1870); *The Great African Island* (1880), and *Madagascar Bibliographie* (1885); Grandidier's *Histoire géographique, naturelle, et politique de Madagascar* (28 4to vols., 1876 et seq.); *Guide de l'Annuaire à Madagascar* 3 vols., 1900; other French books by Blanchard (1875), Gontier (1895), and Catat (1896); and English by Oliver (1885), Cousins (1895), Maude (1895), Knight (1896).

Mad-apple, a name sometimes given to the Apple of Sodom (q.v.), to the produce of the Egg-plant (q.v.), and to a kind of Galls (q.v.).

Maddalo'ni, a city of Italy, 17 miles by rail NNE. of Naples. Pop. 17,072.

Madden, SIR FREDERICK, an eminent English antiquary, born in Portsmouth in 1804, employed in the British Museum first as assistant keeper, from 1837 as keeper, in the department of MSS. He was knighted in 1832, and gazetted as one of the gentlemen of the privy chamber. In 1866 he retired from his office in the British Museum, and he died in London, 8th March 1873. Madden edited many works of literary or historical interest, including *Havelok the Dane* (1833), *William and the Werewolf* (1832), the early English versions of the *Gesta Romanorum* (1838), *The Wycliffite Version of the Holy Scriptures* (1830), *Layamon's Beut* (1847), and the *Historia Anglorum* of Matthew Paris, for the Rolls series (1858). As an editor he shows a rare combination of profound scholarship and temperate caution. His original writings are

found in the pages of the *Archæologia* and *Collectanea Topographica*.

Madder (*Rubia*), a genus of plants of the natural order Rubiaceæ. The species are found in the tropical and warmer temperate parts of both the Old and New Worlds, and from early times till recently were important for the colouring matter of their roots, especially for dyeing Turkey-red. The most important is the Common Madder or Dyer's Madder (*R. tinctorum*), a native probably of the south of Europe as well as of Asia. It is a perennial, with weak stems and whorls of four to six elliptic or lanceolate glossy leaves, the stem and leaves rough with sharp prickles, small greenish-yellow flowers, and black fruit. Munjeet, or Indian Madder (*R. munjista* or *cordifolia*), ranks next to it in importance. *R. peregrina*, found in the south-west of England, and called Wild Madder, is very similar to *R. tinctorum*. Since the discovery of artificial Alizarin (q.v.) the commercial importance of madder has rapidly decreased (see DYEING, Vol. IV, p. 138). In 1875, 126,152 cwt. were imported into Britain (value £410,993); but in 1888 (with munjeet, garancine) only 14,204 cwt. (value £18,067).

Madeira, the largest of a small group of islands in the North Atlantic Ocean, off the north-west coast of Africa, from the nearest point of which it is 390 miles distant, in 32° 40' N. lat., 17° W. long. It lies 1164 miles SW. of the Lizard, and 535 miles SW. of Lisbon, and is within four days' sail of Plymouth, and six of Liverpool. The other islands of the group are Porto Santo, 23 miles to the NE., with a population of less than 2000; here Columbus lived for a time before he touched at Funchal. The Desertas, 11 miles SE., are three uninhabited islands consisting of Deserta Grande, Bugio, and Ilheo Chão. Madeira (Portuguese, 'timber,' the island having once been well wooded) was uninhabited when discovered in the 14th century, and was first settled in 1419. It is 38 miles long, by 12 to 15 wide, and along with the other islands of the group is treated as an integral province of Portugal, entitled to send representatives to the Cortes at Lisbon. It was occupied by British troops in 1801 for a few months, and again from 1807 to 1814. Pop. (1881) 132,223; estimated (1898) 140,000. It is traversed by a mountain-chain running east and west, with deep ravines between the lateral ridges thrown off, the most notable of which is the 'Grand Central,' with a depth of more than 2000 feet. The islands are of volcanic origin, and are the summits of lofty mountains, rising in Pico Ruivo to 6659 feet, in Torres Peaks to 6000, Pico Anfiado to 5895, and in many others to 4000 and 5000 feet. Slight earthquakes occasionally occur. In the south the brooks are dry in summer, and the country is treeless and arid; the north side is more luxuriant and fertile, with wider areas of cultivated ground; in the north-west are undulating grassy plains. The coasts are steep and precipitous, the only harbour being that of Funchal (q.v.) on the south coast, which is little better than an open roadstead where passengers are landed in boats. The Loo rock has, however, been joined to the mainland to form a breakwater, and a pier was undertaken in 1889.

The clouds, which are attracted by the mountains, yield plenty of moisture, and the climate is remarkable for its constancy, though probably too relaxing for those in perfect health, and accustomed to a temperate climate. The thermometer at Funchal shows a mean temperature of 61° F. At the coldest season the thermometer occasionally registers a minimum of 50° F. In the hottest days of summer it seldom rises above 80°, while 90° is exceptional. The prevailing wind during nine

months of the year is north east. The average rainfall is 29 inches, and the average number of days on which rain falls in heavy showers is 70, but there are few really wet days. The temperate and constant warmth of its climate has made it a favourite resort for invalids affected by pulmonary disease. The only land reptile is the lizard, and Madeira has no indigenous mammalia, though the ordinary domestic animals, together with rabbits, rats, and mice, have been introduced by the Portuguese. The fruits and grains of Europe are cultivated on the lower levels; the products include wheat, barley, Indian corn, the potato, oranges, lemons, guavas, mangos, figs, and bananas. Travellers praise the golden splendour of the wide expanses of gorse and broom in blossom, and of the marvellous masses of colour, pink, mauve, and brick-dust red of the flora of the island. There are between 300 and 400 genera of wild flowering plants, and 717 species; more than 40 species of ferns, and 100 of moss.

Wine is the chief export, several kinds being produced in the island. That known in Europe as Madeira, a wine of strong body and fine bouquet, is made of a mixture of black and white grapes. The vines were nearly exterminated in 1852 and succeeding years by oidium, but were soon replanted; and oidium and the phylloxera have since been kept in check by sulphur, so that only one bad vintage has been recorded in twenty-five years. Sugar-canes brought from Demetara and the Canary Islands are flourishing.

The inhabitants are of mixed Portuguese, Moorish, and Negro descent; they are of vigorous frame, lively, and industrious, economical and simple in their habits. In 1888 there were 4000 emigrants chiefly to the Brazils. A great drawback to visitors is the absence of roads; the only six miles of macadamised roadway being that between Funchal and Camara do Lobos, a fishing-village of about 6000 inhabitants. Loads are carried on the head by natives, and hammocks and sledges drawn by bullocks are used for the tracks, while small sledges assist travellers down the mountains sometimes. The government is non-progressive, and Roman Catholicism is predominant. At Funchal there is the governor's palace, town-hall, opera-house, cathedral, English church, and Presbyterian church in connection with the Free Church of Scotland. The Lyceo at Funchal has 7 professors paid by government.

Articles of native produce, such as meat, poultry, and eggs, are cheap; but all imported articles, owing to the high import duty, are dear. There is a weekly mail and cable connection from Funchal with Lisbon and Brazil. The imports have an annual value of about £200,000. The value of the exports, mainly wine, reaches some years £185,000. The leading imports consist of coal, dry-goods, maize, wheat, and petroleum. The export of fruit and vegetables is on the increase; and as irrigation has been introduced with great advantage, Madeira promises to become more and more the market-garden of London. The trade is chiefly with Great Britain.

See works by White (2d ed. 1860), Graham (1869), Piazza Smyth (1882), Miss Taylor (1882), Yate Johnson (1883), Brown (1890), C. A. Gordon (1894), and articles in *Lubbock's Magazine* (vol. xii. 1875) and *Blackwood's* (vol. cxliii. 1888).

Madeira, the great affluent of the Amazons, has its origin in the confluence of the Mamore (q.v.) and Cunaporé (q.v.), at about 12° S. lat., the Beni (q.v.) joining 110 miles lower down. The river then flows north east to the Amazons, its drainage basin embracing some 425,000 sq. m. From its mouth to its first falls the distance is 578 miles; above this point navigation is broken

by a series of nineteen falls, rapids, and cataracts for a distance of 230 miles, and it has been proposed to construct a railway to pass these, and so provide an outlet by the Amazons for the products of Bolivia. See Keller-Leuzinger, *Com Amazonas und Madaina* (1873; Eng. trans. 1874).

Mādhava is an appellation of the Hindu god Vishnu (q.v.). See **ŚĀNDĪA**.

Madhava Achārya ('Madhava the *Acharya*'—i.e. 'spiritual teacher'), a Hindu writer of the 14th century, famed for his numerous and important works relating to the Vedic, philosophical, legal, and grammatical writings of the ancient Hindus.

Madison, (1) the capital of Wisconsin, founded in 1836, is situated on an isthmus between Lakes Mendota and Monona, 82 miles W. of Milwaukee, at the junction of several railways. It contains the state capitol, university (founded in 1849, and open to both sexes), and lunatic asylum, and has manufactures of flour, farming implements, machinery, &c. Pop. (1885) 12,064.—(2) Capital of Jefferson county, Indiana, on the Ohio River, 86 miles by rail SSE of Indianapolis. It has flour-mills, boiler and engine works, steamboat-yards, and manufactories of furniture and leather, besides large pork-packing establishments. Pop. (1880) 8945; (1890) 8923.

Madison, JAMES, fourth president of the United States, was born at Port Conway, Virginia, March 16, 1751, graduated at Princeton in 1772, and studied law. In 1776 he was a member of the Virginia Convention, and took a useful part in drawing up the state constitution. His life from this time was devoted to politics, and he became one of the most eminent, accomplished, and respected of American statesmen. In 1780 he was elected to the Continental congress, and in 1784 to the legislature of Virginia, in which he was chiefly instrumental in securing the recognition of the right to religious liberty. But at this period anarchy was threatening the young republic, which hitherto had been but a loose confederation of states. Congress was a deliberative body merely; its members represented states only, and its powers were practically confined to that of giving advice. Madison was active in bringing about the Convention of 1787, which framed the Federal constitution. There he acted with Jay and Hamilton, and with them wrote the *Federalist*. He was the chief author of the 'Virginia plan,' which even went some way towards disregarding state rights. He also suggested the important compromise under which, whether in apportioning taxation or representation, slaves were to be regarded as population and not chattels, but five were reckoned as three persons—the so-called 'three-fifths rule,' which secured the adoption of the constitution by South Carolina and the other slave-holding states. A month's discussion and all Madison's arguments were necessary before the Virginia Convention was brought to ratify the constitution, and that only by 89 votes to 79. Madison was elected to the first national congress. He had done as much as any man, perhaps, to secure the adoption of the constitution, but he now showed himself anxious to limit the powers of the central government to the strict letter of their commission therein contained. He opposed the financial policy of Hamilton, and became a leader of the Republican or Jeffersonian party. In 1801, Jefferson having been elected president, Madison was made secretary of state, which post he held during the eight years of Jefferson's administration. In 1809 he was elected president. The European wars of that period, with their blockades and orders in council, were destructive of American commerce, and ultimately brought on a war with England, which was declared in 1812, and

continued for two years, at an enormous cost of life and treasure. In 1817, at the close of his second term, Madison retired to his seat at Montpelier, Virginia, where he died, June 28, 1836. Modest and reserved, courteous and kindly, he is a pleasant as well as an important figure in American history. He was not a brilliant man, but he was a statesman of eminent ability and purity of character. See the *Lives* by Rives (Boston, 3 vols. 1859-68) and Gay ('American Statesmen' series, 1884).

Madness. See **INSANITY**.

Madoc, son of Owen Gwynedd, a Welsh prince, is believed by his countrymen to have discovered America about 300 years before Columbus. Compelled, it is said, by civil strife, to abandon his native land, he sailed westward in 1170 with a small fleet, and, after a voyage of several weeks, reached a country whose productions and inhabitants were quite unlike those of Europe. Here he lived for a long time; then, returning to Wales, he gave an account of the new land that he had discovered, equipped another fleet, set sail again, and was never more heard of. The story will be found in Lloyd and Powell's *History of Cambria* (1584); but see the essay by Thomas Stephens written in 1858 for the *Eisteddfod*, and published in 1893. There is no foundation for this Welsh tradition; even if it were, the Northmen have a prior claim to the discovery of America, for it is beyond doubt that Greenland and the New England States were visited by them at a much earlier period. Catlin in his *Lectures on the North American Indians* (1841) hazardingly describes the Tuscaroras as a mixed race descended from Madoc's Welshmen and the aborigines. Southey has chosen the story of Madoc as the subject of one of his so-called epics.

Madonna, an Italian word meaning 'My Lady,' used as the generic title for works of art, generally paintings, representing the Virgin, or the Virgin with the Infant Christ. Legend credits St Luke with having painted the first Madonna, a portrait put on the canvas from life, and with having carved the image of the Virgin in the Santa Casa at Loreto. After the Council of Ephesus (431), images of the Virgin with the Saviour in her arms became the recognised symbols of the orthodox faith. But the iconoclastic fury fomented by Leo III., the Isaurian, entailed the destruction of many of those early Madonnas. The oldest representations of the Virgin that survive are those which have been found in the catacombs, accompanying the tombs of the early Christians. Cimabue was the first to put natural life into the dead and angular designs of the Byzantine artists, and with him began that wonderfully productive and brilliant period of Italian art the all dominant theme of which was the Madonna, that culminated in the glorious works of Raphael—the Sistine Madonna, the Madonna della Sedia, &c. These Italian artists handed on the cult to the German masters, who not only executed more realistic, more human pictures of the Virgin, but carved her effigy in wood. Amongst so many artists it is not surprising to find the subject treated in diverse styles and manners. To quote Mrs Jamison (*Legends of the Madonna*, new ed. 1890): 'Thus we have the stern, awful quietude of the old mosaic; the hard lifelessness of the degenerate Greek; the pensive sentiment of the Siena and the stately elegance of the Florentine Madonnas; the intellectual Milanese, with their large foreheads and thoughtful eyes; the tender, refined mysticism of the Umbrian; the sumptuous loveliness of the Venetian; the quaint characteristic of the early German, so stamped with their nationality; . . . the intense lifelike feeling of the Spanish; the prosaic, portrait-like nature of the Flemish schools; and so on.'

The title Madonna is not used with rigid consistency; it is also applied to representations of the Annunciation, Nativity, Adoration of the Magi, Flight into Egypt, Holy Family, and all the several scenes and incidents in which the Virgin Mary personally figures. She is often represented too in certain specific characters with appropriate epithets, as La Vergine Gloriosa (with Jesus), Our Lady of Sorrow, Queen of Heaven, &c. Entire series exist depicting the events of her life, painted by painters like Giotto, Orcagna, Albert Dürer, and Luini. Two common series are the Seven Joys and the Seven Sorrows of the Virgin.

Besides Mrs Jameson's book, see works by Rohault de Fleury (1878), A. Schultz (1879), Erkl (1883), Von Schreibershofen (1886), for the middle ages; 1879); Ehl, for the older German schools (1884); and Laell, for the catacomb pictures (1890).

Madras City (called by the natives *Chennaimattur*) is situated on the Coromandel Coast in 13° 4' N. lat. and 80° 17' E. long., and is the capital of the presidency of the same name. The town extends along the shore for a distance of 9 miles, and covers an area of about 27 sq. m. Originally it consisted of a number of separate villages, which are now united into a single municipality, administered by a president, two vice-presidents, and thirty-two non-official commissioners, of whom twenty-four are elected by the ratepayers and eight nominated by government. The roadstead, in which till quite recently all ships had to lie, is very much exposed, and on the approach of a cyclone all vessels put out to sea. A pier was erected in 1859-62. A harbour begun in 1876 was seriously damaged in 1881, and the construction of the harbour was being carried on in 1890, but it is questionable whether it will ever be safe for ships to remain in it during a heavy storm. It already, however, greatly facilitates the landing of cargo during rough weather, and passengers have no longer to cross the surf in going to or coming from steamers. A marked feature of this part of the coast is the heavy surf which rolls in, even in comparatively calm weather. In ordinary weather the surf breaks about 300 feet from the shore, and the wave is of no great height; but in stormy weather there are two lines of surf, the outer one being some 1000 feet from the shore with a wave of 12 to 14 feet high. The ordinary surf can be crossed with safety by the native *mussah* boats, which are formed of planks sewn together with string, but no boat can live through the surf in a cyclone. The port is liable to be visited by these storms at two seasons—towards the end of May and beginning of June, when the south-west monsoon sets in, and in October, November, and the early part of December, during the prevalence of the north-east monsoon. Cyclones are rare at other times. The climate of Madras may be described as hot and moderately dry. The annual rainfall averages 49 inches, falling on ninety-five days, but during the seventy-four years ending with 1889 it varied from 88½ inches in 1827 to 18½ inches in 1822. The mean temperature for the year is 82° F., varying from 76° in December and January to 88° in June. During the hot months the temperature frequently rises above 100°, but the *monsoinum* in no month exceeds 99°. The mean annual range is 18°. The highest temperature recorded in the twenty-seven years ending with 1889 was 112.9 and the lowest 57.6°. The heat of the hot season is greatly modified by a sea-breeze, which often sets in soon after noon and blows till sunset. On the whole the climate is a healthy one.

On the shore, midway between the north and south extremities of the town, is Fort St George, the original settlement. This fort (built 1730) still contains the council chamber, a number

of government offices, and barracks for the European troops. North of the fort lies Black Town, which contains most of the business offices and a crowded native population; south of it lies Triplicane, the chief Mohammedan centre. Inland and to the extreme south lie the houses chiefly occupied by Europeans, most of which stand in large compounds or parks, surrounded by trees. Though Madras cannot compete with either Calcutta or Bombay in the magnificence of its public buildings, it contains some that are worthy of note. Amongst these may be mentioned Government House, the Chepauk Palace, the Senate House, St Andrew's Kirk, St George's Cathedral (containing a monument by Chantrey to Bishop Heber), the Madras Club, the post and telegraph office, and the new High Court buildings. Many of the buildings are rendered specially striking by the free use of polished *chamun* made from shell lime. The Madras University, founded in 1857, is simply an examining body, the teaching being done by affiliated colleges throughout the presidency. Some idea of the work done by the university may be gathered from the fact that in 1888-89 there were 7433 candidates for matriculation, 576 for the degree of B.A., 163 for the degree of B.L., and smaller numbers for the other degrees. In addition to colleges for the study of arts, medicine, and engineering, there are, in or near the city, a School of Art, a College of Agriculture, a branch of the Royal Asiatic Society, and a large museum, containing, amongst other things, very valuable collections of Indian coins and of sculptured marbles from the Buddhist 'topes' at Anuravati. Madras is the seat of the government and of the supreme court. Pop. (1881) 465,848, of whom 3205 were Europeans, 12,659 Eurasians, and 50,298 Mohammedans, the rest being Hindus by faith; (1891) 452,518. The chief articles of export are coffee, tea, cotton, grain, hides, indigo, oil seeds, dyestuffs, sugar, and horns. The average value of exports and imports for ten years previous to 1895 was about £4,000,000 and £11,000,000 respectively. For the railway connection, see under the presidency below. The Buckingham Canal gives a waterway to the north and south parallel to the coast.

Madras Presidency, one of the administrative divisions of India, occupies the southern part of the peninsula; it is also known as the Presidency of Fort St George. It extends from lat. 20° 18' on the eastern coast and lat. 14° on the west coast to Cape Comorin in lat. 8° 4'. The total area, excluding native states, is 139,000 sq. m.; pop. (1881) 30,868,504; (1891) 35,630,440. (The native states have an area of 9600 sq. m., and a population of 3,700,622.) Of these some 39 millions are Hindus, about 2 millions Mohammedans, and 800,000 Christians. For revenue purposes the presidency is divided into twenty-two districts. The chief government officer in each district is the collector, who controls all departments except the judicial. The principal mountains belong to the two chains of the Eastern and Western Ghats. The former have an average height of 1500 feet, but rise in parts to 3000 or 4000 feet; the latter have a considerably greater average height, with a number of peaks rising from 5000 to 8000 feet, and a few even higher. A considerable part of the presidency forms a tableland, which includes the native states of Mysore and the Deccan, rising to a height of from 1000 to 3000 feet. A very notable geographical feature is the Palghat Gap in the Western Ghats, 25 miles wide, and only 1000 feet above sea-level. Through it passed the old trade route between the west and east coast, now superseded by a railway, and through it the south-west monsoon blows strongly, bringing rain to a considerable

area lying east of it. The Nilgiri Hills, on which at Ootacamund is the summer seat of the government, may be looked on as the junction of the Eastern and Western Ghats. There are also several important outlying spurs, of which the Shevaroyis in Salem, the Anamalais in Coimbatore, and the Palnis in Madura are the most noteworthy. The chief rivers are the Godavari, the Kistna, and the Kaveri, all rising in the Western Ghats, and crossing the peninsula in a south-easterly direction to the Bay of Bengal. Very extensive irrigation-works have been carried out in connection with each of these rivers, while minor irrigation-works are to be found in almost all parts of the presidency. Railway communication is being rapidly extended throughout the country. The Madras Railway (5 ft. 6 in. gauge), with its terminus at Madras, crosses the country in two lines. The one passes in a south-westerly direction to Calicut on the Malabar coast, with branches to Bangalore, where it connects with the Mysore Railway, and to Mettappallem, the station for the Nilgiris. The other crosses in a north-westerly direction to Raichor, where it connects with the Great Indian Peninsular Railway. At Guntakal it makes connection with the extensive system of the South Mahratta Railway. The South Indian Railway (metre gauge) runs south from Madras to Timmavelli, with branches to Pondicherry, Negapatam, and Tuticorin; a line from Trichinopoly connects it with the Madras Railway at Erode, and another branch from Chengalpat connects it with the same railway at Arcotum. There are good roads in most parts of the presidency.

The climate differs greatly in different parts. In the Carnatic the dry season lasts from the middle of December till the end of June, there being often three or four months without any rain. From June to October there are heavy showers, and from October to the middle of December the north-east monsoon brings copious rain. Over a great part of the east coast strip the annual rainfall exceeds 40 inches; but in some parts inland it does not exceed 20 inches, and in many parts it falls below 30 inches. The mean annual temperature is about 82°, and in many stations a maximum temperature of upwards of 110° is not uncommon. On the Malabar coast the rainfall is much heavier, and comes with the south-west monsoon. The moisture-laden winds, being driven upwards by the lofty mountains, cool as they ascend, and pour down their surplus moisture on the strip of land between the hills and the sea. Thus, the fall from June to October is 119 inches at Mangalore, and 132 inches at Honawar. The annual rainfall at Mangalore is 131 inches, and at Cochin 115 inches; at the latter place 227 inches fell in 1882. This abundant rainfall leads to a most luxuriant vegetation in Travancore and on the west coast. The mean temperature varies from 79° to 80°, and there are no great extremes. The climate of the hill-stations is not unlike that of England at its best. Frosts are not unknown, but are slight, and in summer the temperature never rises very high. The climate of the Nilgiris has been described as 'that of the English spring and summer without Atlantic storms or the bitter east winds of March.' Save when the monsoon is at its height, it would be difficult to imagine a finer climate. Rice is the chief crop grown throughout the presidency, but several other cereals are largely cultivated. Pulse, groundnut and other oil-seeds, indigo, and sugarcane are of great importance in certain parts. Cotton is grown over a wide area in the drier parts, and tobacco of excellent quality is produced in large quantities on islands in the Godavari, and in parts of the Coimbatore and Madura districts. Trichinopoly cigars and cheroots are increasingly

exported. On the hills tea, coffee, and cinchona are successfully cultivated over wide areas. The manufacturing industry is represented by cotton, sugar, gunny bags, paper, ice, and tiles. Madras is not rich in minerals; but gold is found in many parts, and, though the most productive mines at present worked lie in Mysore, there is good reason to hope for equally favourable results from mines opened in other areas of the Darwar Rocks, which are apparently the only auriferous strata in the presidency. Iron of excellent quality abounds, and is worked by the natives; but the want of fuel prevents any large development of the iron industry. Diamonds have been largely found, chiefly in the Karnul district. The forests are now carefully protected by the state, and are of great value, especially the teak forests.

The first English settlement was made at Masulipatam in 1611. In 1616 factories were established on the west coast at Calicut and Cranganore. In 1619 a factory was opened alongside of the Dutch one at Pulicat, but this was soon withdrawn. In 1628 the Masulipatam factory was transferred to Arnagaon, 40 miles north of Pulicat, and this was the first place fortified by the English in India. In 1639 a settlement was obtained at Madras. Christian missions have made more progress in Madras than in any other part of India, there being 228 Christians in every 10,000 inhabitants; Lower Burma follows closely with 225, while Bombay has only 62 and Bengal 18.

Madras System. See BELL (ANDREW).

Madrepore. See CORAL.

Madrid. the capital of Spain and seat of the Spanish government, is situated in the department of the same name, in the ancient province of New Castile, on the left bank of the Manzanares, in 40° 24' N. lat. and 3° 25' W. long., 880 miles by rail from Paris. It is built on a treeless, ill-watered plateau, 2060 feet above the sea-level, and was created capital by the arbitrary will of a sovereign. The Manzanares is merely a mountain-torrent falling into the Jarama, a tributary of the Tagus, useless for communication, and not even to be depended upon to supply the city with water, which is brought from the Guadarrama Mountains by an aqueduct 42 miles in length. The sole recommendation of Madrid as capital is its central position in the Peninsula; it is nearly equidistant from the Atlantic and Mediterranean coasts and from the Pyrenean frontier. Swept, during the winter months, by the icy winds from the snow-capped mountains on the north, and exposed in summer to a burning sun, it has a climate which, though dry and bright, shows extreme variations of temperature (104° to 14°). The average of the eight warmer months (March to October) is 66° F., and that of the four remaining ones 44°, but the difference at the same time between sun and shade is sometimes as great as 20°. In spite of a death-rate of over 34 per thousand, caused by its treacherous climate and the insanitary habits of its citizens, the increase of Madrid has of late years been rapid. At the beginning of the 19th century the population was about 160,000; in 1860 it was 298,000; in 1870, 332,000, and in 1895, 500,000; less than 40 per cent., however, of the inhabitants are natives of the city. Madrid is nearly circular, unfortified, and about 10 miles in circumference.

Through the Latin and Arabic chroniclers Madrid can trace its existence as far back as the 10th century, when it was known as *Madina Magerit*, a fortified post of some importance on the frontier of the Moorish Kingdom of Toledo. First retaken by the Christians under Ramiro II. of Castile (939), it was not finally conquered till the reign of

Alfonso VI. (1085). A list of its inhabitants, Castilian and Mozarab, appears in a charter of Toledo granted by Alfonso VIII. in 1117. After this time the mention of it in documents is frequent. The part first inhabited was the high ground where the royal palace now stands on the west of the city: here was the stronghold that first gave the place celebrity. As the Christian frontier was pushed farther southward, Madrid would probably have again sunk into obscurity had it not been a favourite place of meeting for expeditions against the Moors, and temporary residence of the kings, who were attracted by the game sheltered in the extensive forests, long since destroyed, to the great detriment of the climate. The city received its first charter in 1202, and the Cortes were first held in it by Ferdinand VI. (1309), and subsequently by Alfonso XI. and Henry III., the former of whom altered the constitution of the city, giving it twelve *regidores* and two *alcaldes* in place of the *Señor de Madrid*, who had formerly been elected by nobles and commons. John II. and Henry IV. granted additional privileges to the city. Isabel the Catholic acquired the city after a sharp struggle with the partisans of her rival Doña Juana, and it now became a place of some importance owing to the more frequent presence of the court. After the death of the Catholic kings, the regent, Cardinal Cisneros, ruled Spain from Madrid, and, though the city embraced the popular cause in the war of the Comuneros, it received such privileges from the Emperor Charles V. that its population rose rapidly from 3000 to 6000 households; during this reign it furnished a prison for Francis I., king of France. When in 1561 Madrid was declared capital of Spain by Philip II. it contained about 30,000 inhabitants. With the court came the great nobles, who built palaces, and innumerable friars, who established convents; nevertheless till the middle of the 17th century the city presented a mean appearance, and most of the houses were only one story high, thus avoiding the obligation of lodging the numerous retinue of the kings. Philip IV. made some improvements, especially the laying out of the park of the Buen Retiro, and in his time Madrid, though still unpaved, filthy, and roamed over at will by the privileged pigs of St Anthony, was the seat of one of the most brilliant courts of Europe. The greatest benefactor of the city was King Charles III., many of whose splendid works still exist. Madrid took an active part in the revolution that wrested the power from Godoy, the Prince of the Peace, and during the domination of Napoleon (2d May 1808) made a gallant attempt to shake off the foreign yoke. Though taken by the allied force under the command of the Duke of Wellington in 1812, Madrid was not finally rid of the French till 1813. The next year marked the return of the Bourbon king. Although the scene of several of the revolutions that form so large a part of Spanish history during the 19th century, Madrid, aided by the suppression (1836) of the convents, the introduction of railways (1850), and an abundant supply of good water (1858), has been continually and rapidly advancing in importance and prosperity.

The general aspect of the city is clean and gay, whilst the older parts, the Calle de Toledo, Plaza Mayor, and district of Lavapies, are picturesque; no trace of the medieval city now remains. It is administered by a military and a civil governor, aided by the mayors of the ten districts into which it is divided. The police is good, and Madrid is as safe as any European capital, well lighted, but indifferently paved (wood pavements have lately been laid down in several streets). The new streets are generally fine, broad, and planted with trees; the houses well built, lofty, stuccoed and painted, and inhabited by several families living in flats, guarded

at night by watchmen (*serenos*), to whom the key of the street door is entrusted. A great feature is the magnificent open spaces, chief of which is the Prado, running north and south through the eastern part of the city, and, with its continuations, three miles long; it contains four handsome fountains with groups of statuary, a fine obelisk to commemorate the gallant struggle of the citizens with the French (May 2, 1808), monuments to Columbus, the Marques del Duero, and Isabel the Catholic. The picture-gallery, founded by Charles III., and situated in the Prado, is one of the finest in Europe, and contains the principal works of Velasquez and Murillo, besides many of the masterpieces of Raphael, Tintoretto, Rubens, Teniers, and Van Dyck. Two other parks are the Buen Retiro, the fashionable promenade on the east of the city, and the Casa de Campo on the west. Midway between its extremities the Prado is crossed at right angles by the Calle de Alcalá, the finest street in the city, about a mile in length, and leading from outside the fine triumphal arch rebuilt by Charles III. to the Puerta del Sol, a handsome though not very large square, with broad pavements, and a fountain in the centre. This square is the heart of Madrid; here converge the principal tramway lines which have so greatly aided the extension of the city, and in it and the streets branching off from it are situated the principal shops and places of business. The finest square is the Plaza Mayor, formerly the scene of bull-fights and *autos da fe*, and said to have held 50,000 spectators; it contains a gigantic equestrian statue of Philip III., its founder, and was formerly the centre of Madrid, but is now somewhat decayed as the city has moved farther eastward. On the west of the city is situated the royal palace; commenced in 1738 to replace the ancient Alcazar, which had been burned down, it was finished in 1764 at a cost of about £3,000,000. It is a fine stone building in the Tuscan style, forming a square of 479 feet, and enclosing a court of 140 feet; its architect was the Italian Sacchetti. Dependencies of the palace are the royal armoury, containing the finest collection in the world, and the royal stables, remarkable for their extent. Other fine buildings are the palace of justice, formerly a convent; the houses of parliament, Palacio de los Consejos; Buena Vista Palace, now the ministry of war; the new national bank; and the town hall. Besides a flourishing university, founded by Cardinal Cisneros, and two high schools, Madrid contains 118 municipal and 21 pauper schools, with an aggregate of 11,000 pupils. There are many charitable institutions, and the municipality maintains dispensaries in each of the ten districts; but hospital accommodation is deficient, and beggars abound in spite of the law. Madrid is well provided with newspapers (about six leading dailies and several periodical reviews) and public libraries, the chief being the National Library, with more than half a million volumes, and the library of the university; those of the palace and of the Academy of History contain many treasures. Amongst the many learned societies the principal are the Academies of History and the Spanish Language; the Ateneo is a flourishing literary club with a good collection of books. The opera-house is one of the finest in the world; all the theatres must by law be lit by electricity. The bull-ring, situated outside the gates on the east, is a solid structure seating 11,000, and owned by the provincial council. The churches are mostly small and insignificant; the handsomest is the recently-rebuilt church of San Francisco. The plain church of San Isidro, patron of Madrid, serves as cathedral. The old church of Atocha, containing a much-venerated image, the tombs of several celebrated

men, and many banners that recalled the great days of Spain, has recently been pulled down. Madrid is rather a consuming than a producing centre; such manufactures as do exist contribute only in a small degree to supply the needs of the city. Ironfoundry, the manufacture of furniture, carriages, and fancy articles are carried on on a small scale. The manufacture of tobacco, the monopoly of which is farmed by the government to a company, employs many hands, chiefly women. The publishing trade is important, and books are well printed and cheap. The old tapestry-factory still turns out beautiful work, and the potteries at Moncloa are now producing good imitations of many of the artistic kinds of earthenware for which Spain was formerly celebrated. The exchange and money-market, largely carried on by foreigners, is the most important in Spain.

See Ayala y Sastre, *Madrid, Biblioteca de la Provincia* (1889); Mesonero Romanos, *El Antiquo Madrid* (1881). For Madrid (Province), see SPAIN.

Madrigal, a word of uncertain etymology, denotes a short lyrical poem, generally on the subject of love, and characterised by some epigrammatic terseness or quaintness. It was written, as a rule, in iambic metre, contained not less than six or more than thirteen lines, and ran chiefly upon three rhymes. Among the Italians the best writers of madrigals are Petrarch and Tasso; among the French, Montreuil and Monerif; among the Germans, Hagedorn, Voss, Goethe, and A. W. Schlegel; and among the English, Lodge, Withers, Carew, and Suckling.—The name is also applied to the music for a simple song sung in a rich artistic style, but without musical accompaniment. The original composers wrote for three, four, or more voices; but madrigals are now usually sung by a small but well-trained choir. These compositions originated with the Flemings, and before the middle of the 15th century. From them and by them it was carried to Rome and Venice, and to England, where a famous school of madrigal composers flourished from about 1530 to about 1630. The chief composers of the English school were Bird, Weelkes, Kirkby, Wilby, Morley, Dowland, Bonet, Este, Bateson, and Orlando Gibbons. Madrigal singing ceased to be popular in the 18th century; its place is now taken by glee-singing (see GLEE). The Madrigal Society of London, founded in 1741 by John Lumyns, claims to be the oldest musical association in Europe. See Sherman, *Madrigals and Catches* (New York, 1887).

Madura, a maritime district of India, in the south of the Presidency of Madras, is bounded on the E. by the Gulf of Manaar, which separates Hindustan from Ceylon; it has an area of 8808 sq. m., and a pop. of 2,608,404. Chief town, Madura, third largest in the presidency; pop. (1881) 73,807; (1891) 87,428. For nearly 2300 years Madura was the political and religious capital of the southernmost part of India. Its Pandyan kings are mentioned by the ancient Greek geographers. In the 17th century the Nayak rulers, chiefly Tirumala (1623-59), built here a magnificent pagoda to Sunderswara (Siva), with a hall having one thousand (997) pillars, a fine palace, now ruined, a summer palace for the god, and a great tank. The Jesuits have been active in Madura since the time of Tirumala; there were 67,554 Roman Catholics in the district in 1881.

Madura, an island of the Dutch East Indies, separated by a narrow strait from the north-east of Java, with an area of 1764 sq. m. It is mostly barren, but possesses numerous forests and salt marshes. Along with some eighty smaller islands, lying mostly to the east, it forms a Dutch residency; area 2040 sq. m.; population 1,500,000

The people, of Malay descent, resemble the Javanese, but are stronger, more enduring, and more enterprising; they make the best native soldiers in the Dutch colonial army.

Madvig, JOHAN NICOLAI, Danish classical scholar, was born at Svaneke, in Bornholm, on 7th August 1804, educated at Frederiksborg and Copenhagen, began to teach at the university in 1826, and in 1829 was appointed to the chair of Latin Language and Literature, and made inspector of higher schools. He took a keen interest also in politics, was one of the chief speakers of the national Liberal party, sat in parliament, held the portfolio of religion and education from 1848 to 1851, and after 1855 was repeatedly elected president of the Danish parliament. He died blind on 13th December 1886. For more than half a century Madvig enjoyed the highest reputation, not in Denmark only, but throughout Europe, as a shrewd, clever critic of the Latin and Greek prose-writers. It was in criticising and emending the text of Cicero and Livy that he won his greatest laurels, his *Emendationes in Ciceronis Libros Philo-sophicos* (1828), editions of *Cicero's De Finibus* (1839; 3d ed., greatly improved, 1876), *Cato Major et Lelius* (1835; 2d ed. 1869), *Emendationes Liviana* (1860; 2d ed. 1876), and the edition of *Livy* (4 vols. 1861-66) being all productions of first-rate scholarship. He provided for students very valuable information on Cicero's works in *Opuscula Academica* (2 vols. 1834-42; 2d ed. 1887); worked out a systematic account of his critical principles in *Adversaria Critica* (3 vols. 1871-84); published in 1841 his well-known *Latin Grammar* (7th ed. 1881), and in 1846 his still better known *Greek Syntax* (Eng. trans. 1853), both excellent works, but now being superseded by the results of newer philological study. The last books from Madvig's pen were a dissertation on the *Constitution and Administration of the Roman State* (2 vols. 1881-82), intended in some sort as supplementary and corrective to Mommsen's great history, and an *Autobiography* (1887).

Maander (now *Bajal Meander*), the ancient name of a river of Asia Minor, rising near Celene, in Phrygia, and flowing 240 miles west-south-westward to the Egean at Miletus. Its windings, proverbial since Cicero's day, are after all nothing remarkable.

Mecenas, C. CILNIUS, a Roman statesman of Etruscan origin, whose name has become a synonym for a patron of letters. He first appears in history in 40 B.C. engaged in arranging a marriage between Octavian and Scribonia. Later we find him negotiating the peace of Brundisium, and acting with vigour in the city during the campaign of Actium. When Octavian assumed the supremacy and the title of Augustus, Mecenas took a chief place in his counsels. The nature and extent of his official power are not very precisely understood, but they were undoubtedly great, though the influence and authority he enjoyed are to be estimated rather from his intimacy with the emperor than his mere position as a public servant. During his later years the friendship was interrupted from reasons that cannot now be exactly ascertained, but mutual esteem survived and no open rupture took place. Mecenas was a thoroughly sincere imperialist. He had a belief in the value of an established government; and when he found that he no longer retained the confidence of his sovereign he did not lapse into a conspirator; but, as a modern minister might do, retired into the obscurity of private life. He had ever been given to luxury and sensual delights, but his complex nature craved the solace also of higher pleasures. He now gave all his time to literature and the society of literary men. He was immensely

rich, and kept an open table for men of parts at his fine house on the Esquiline Hill; above them all he loved the genial Horace. He died in the year S. B. C., leaving the emperor his wealth.

Maclar. See MALAR.

Maelidm. See MAILDUN.

Maelström ('grinding stream'), or **MOSKENSTROM**, a famous whirlpool, or more correctly current, between Moskenis and Mosken, two of the Lofoden Isles (q.v.). The strait is habitually navigated by vessels at high tide and low tide, though in one place the water is always rough and churned into angry foam. When the wind blows directly against the current it becomes extremely dangerous, especially with spring-tides or during a north-west wind. The stories of ships, whales, &c. being swallowed up in the vortex are simply fables; at the same time, a ship once fairly under the influence of the current, would probably founder or be dashed upon the rocks, and whales have often been found stranded on the Flagstadt coast from the same cause. The current takes twelve hours to make a circular revolution. Edgar Allen Poe's imaginative description of the horrors of being sucked down by the Maelstrom is well known. A like dangerous current is the Saltstrom, at the entrance of the Salten Fjord, where a vast mass of water is poured through a narrow opening at a terrific rate. Yet steamboats pass through the Saltstrom, though only at high or low tide.

Maenads. See DIONYSUS.

Maeshowe, a chambered mound in the Mainland of Orkney, 9 miles WNW. of Kirkwall and 1 mile E. of the great stone circle of Stennis. A grassy truncated cone, 36 feet high and 92 feet in diameter, it is surrounded, at a distance of 90 feet from its base, by a trench 40 feet wide, and still in places 8 feet deep. On the west side is a passage, 54 feet long, $2\frac{1}{2}$ to $3\frac{1}{2}$ feet wide, and $3\frac{1}{2}$ to $4\frac{1}{2}$ feet high, with (about midway) a unique doorway. This passage leads to a central chamber, measuring $15\frac{1}{2}$ by 14 feet; converging to a vaulted roof, originally 20 feet high; and built, like the passage,

Maeshowe, ground-plan.

of unpressed slabs and blocks of native stone. On each of the other three sides of the chamber, at a height of 3 feet from the floor, there is a square opening to a cell or 'sepulchral loculus,' 3 feet high, 4 feet wide, and $5\frac{1}{2}$ to 7 feet long. Maeshowe was explored in 1861 by Mr James Farrer, M.P. when it was found to have been ransacked at least once before in the winter probably of 1152-53 by Norwegian, followers of Earl Rognvald, and pilgrims to Jerusalem. Their Runic inscriptions, comprising upwards of 900 letters, thickly cover the walls of the central chamber, and consist mainly of such inscriptions as 'Her-

mund Hordaya carved these runes.' There are carvings besides of eight crosses, a 'worn-knot,' and a nondescript animal. Mere idle scribbles, the runes afford no clue to the origin of the tumulus itself, which Dr Anderson assigns unhesitatingly to the 'Age of Stone,' whilst Fergusson ascribes its erection to Northmen and to a date so recent as 970.

See the article **CELLS**; Farrer, *Notes on the Ruins Inscriptions* (1862); *Proc. Soc. Ant. Scot.* (1867); James Fergusson, *Rede Stone Monuments* (1872); and Joseph Anderson, *Scotland in Pagan Times* (1886).

Maestricht, the capital of the Dutch province of Limburg, 19 miles NNE. of Liege by rail, 19 WNW. of Aix-la-Chapelle, and 152 SSE. of Amsterdam. It lies on the left bank of the Meuse or Maas, a stone bridge (1683), 133 yards long, connecting it with the suburb of Wilk. Formerly an important fortress, it is still a garrison town; but the fortifications were dismantled in 1871-78. The town-hall, with spire and carillon (1662), contains many paintings and a library; and in the three-towered church of St Servatius (12th-14th century), the cathedral once, is a 'Descent from the Cross,' by Van Dyck. But Maestricht's great sight is the subterranean quarries of the Piotersberg, formerly called *Mons Hannorum* (330 feet). Their labyrinthine passages, 12 feet wide, and 20 to 50 feet high, number 16,000, and extend over an area of 13 by 6 miles. They are supposed to have been worked first by the Romans, and, amongst other fossils, have yielded two heads of the huge *Mosasaurus* (q.v.). The manufactures include glass, earthenware, and carpets. Pop. (1876) 29,083; (1898) 34,362. Maestricht, the Roman *Trajectum ad Mosam*, was no less than six times besieged between 1579 and 1814, and in 1830 withstood the insurgent Belgians.

Maestricht Beds, a section of the Danian or uppermost subdivision of the Cretaceous System (q.v.). In Britain the chalk with flints is covered with Tertiary strata, but at Maestricht in Holland there occurs a thickness of 100 feet of soft yellowish limestone with a conglomeratic base, abounding in the remains of Corals and Polyzoa. The fossils are peculiar.

Maeterlinck, MAURICE, was born at Ghent in 1864, and became known to the world of Paris in 1890 by a play, *La Princesse Maline*. Other plays are *L'Entrée*, *Les Accablés*, *Pathos et Mélancolie*, and *Aglaraine et Schizette* (all translated into English); and he has shown his religious sympathies by a translation into modern Flemish of Roysbroeck the Mystic (1891).

Mafeking, a town in the north-east corner of Cape Colony, connected in 1894 with the railway system from Capetown. Hence in 1896 Jameson (q.v.) started on his disastrous raid into the Transvaal. On the outbreak of the Transvaal war in 1899 Mafeking was invested by the Boer forces, but was heroically defended by Colonel Baden Powell with a small garrison, and after a siege of seven months, was relieved on 17th May 1900.

Maffei, FRANCESCO SEMPIONE, MARCHESE DI, playwright and antiquary, was born at Verona, 1st June 1675, and studied in the Jesuit College at Parma. He spent the years 1703-4 in military service, under his brother Alessandro, a distinguished soldier and field-marshal, but ultimately devoted himself to literary pursuits. His tragedy of *Mejago* (1714) was so well received that it went through seventy editions in his own lifetime. His comedy of *Le Cerimonie* (1728) was also successful. *Verona Illustrata* (1731-32; new ed. 1827

is a work of much brilliancy and learning. After four years in France (1732-36) he visited England, Holland, and Germany, then settled in his birth-place, where he died 11th February 1755. A collective edition of his works was published at Venice in 1790, in 21 vols.

Mafia, a secret society in Sicily, more powerful than the Camorra (q.v.) of Naples, which has organised lawlessness, and made itself more feared than the law. Its code of honour (the *omertà*) binds the members to seek no redress from the courts, nor ever to give evidence before them; its object is to override the law, and to rule the island. In an organised form, however, the Mafia survives only in isolated localities; as it exists in the island as a whole, it rather expresses an idea than indicates a society with regular chiefs and councillors. It represents the survival among the people of a preference for owing the securing of their persons and property rather to their own strength and influence than to those of the law and its officers. Therefore a distinction is drawn between the high and the low Mafia, the latter embracing the great mass of members who, themselves not active in the matter, are afraid to set themselves against the Mafia, and are content to accept the protection of this shadowy league, which in them inspires more awe than do the courts of justice. Indeed, much of the Mafia's strength and vitality is directly due to this looseness of organisation, and to the fact that it is an ingrained mode of thought, an idea, and not an organised society, that the government has to root out. Direct robbery and violence are resorted to only for vengeance; for practical purposes the employment of isolation—in fact, the system of boycotting carried to the extreme point—is sufficiently efficacious. From the landholders blackmail is levied in return for protection, and they must employ *mafiosi* only on their farms; and the *culletta* follows those who denounce or in any way injure a member of the fraternity. The Mafia controls elections, protects its members against the officers of justice, assists smugglers, directs strikes, and even fixes the hire of workmen. The government's efforts have failed to stamp out the society; but numbers of its members have been driven abroad, and swelled the criminal classes of New York and New Orleans. See Alongi, *La Mafia* (Trin, 1887); Le Faure, *La Mafia* (Paris, 1892).

Mafra, a town of Portugal, 20 miles NW. of Lisbon. Pop. 3020. The palace, built by John V. in 1717-31 as a rival to the Escorial, is 770 feet long and 690 feet wide; contains 866 rooms, and a library of 30,000 vols.; but now serves as a barrack and military academy.

Magadoxo, or MUKDISH, a port on the east coast of Somaliland, 250 miles NE. of the mouth of the Juba river. Pop. 5000.

Magazine. See PERIODICALS. For Magazine Rifle, see RIFLE.

Magdala, a hill fortress and small town of Abyssinia (q.v.), 300 miles S. of Amesley Bay, on the Red Sea, stood perched on a plateau 9110 feet above sea level. It was the place of captivity of the British prisoners for whose rescue an expedition was sent out under Sir Robert Napier (Lord Napier of Magdala); and on 13th April 1868 the town was burned and its defences destroyed.

Magdalena, the principal river of Colombia, rises in the Central Cordillera, about 2° N. lat., and only 8 miles from the source of the Cauca. These streams flow north on either side of the Cordillera, uniting about 130 miles from the sea. The Magdalena, which ends in a large delta, is closed to sea-going vessels by a bar with dangerous shifting sands; merchandise is conveyed by a railway (18

miles) from Barranquilla to Puerto Colombia, the shipping port, where a pier has been built. The river is navigable to Honda, 500 miles, where the rapids begin; above these it has been navigated by a German steamer to Neiva since 1875, and a railway (20 miles) alongside the rapids connects the upper and lower sections. The Magdalena's drainage area is calculated at 92,900 sq. m.

Magdalene, MARY, or MARY OF MAGDALA, so named from a town near Tiberias, a woman 'out of whom Jesus cast seven devils,' and who believed in Him and followed Him. She was one of the women who stood by the cross, and one of those who went with sweet spices to the sepulchre. To her He first appeared after His resurrection. In consequence of an unfounded notion identifying her with the woman who had been a sinner, described in Luke, vii. 36-50, as having anointed our Lord's feet with ointment, and wiped them with her hair, Mary Magdalene has been long and generally regarded as a woman whose early life had been very profligate, although of this there is no hint whatever in the narratives of the evangelists; and the Magdalenes, so frequent amongst works of art, represent her according to this prevalent opinion. Our word *maudlin* (lit. 'weeping-eyed') is due to the same notion, and indeed the very name Magdalene has come to be applied to women who have fallen from chastity, and institutions for the reception of repentant prostitutes are known as *Magdalene Asylums*.

The conclusion of most commentators is that there were two anointings, one in some city unnamed during our Lord's Galilean ministry (Luke vii.), the other at Bethany before the last entry into Jerusalem (Matt. xxvi., Mark xiv., John xii.). The one passage adduced to prove that in these two narratives we have but one woman is John, xi. 2, and it has been argued by some that this could not possibly refer by anticipation to the history that follows in chap. xii. Against this it may be said that to impute a life of impurity to Mary of Bethany is to make an entirely gratuitous assumption. The evidence to identify Mary Magdalene with either actor in the two narratives is still less secure. The identity of Mary Magdalene with the sinner was first positively asserted by Gregory the Great in his *Homilies*, and the services of the feast of St Mary Magdalene were arranged on the assumption of its truth. But a great and growing consensus of opinion among the most competent scholars, and those not merely Protestant, is conclusive against it.

Magdalen Islands, a small group near the centre of the Gulf of St Lawrence, 54 miles NW. of Cape Breton Island. The largest is Collin's Island. The people are supported by the lobster, cod, herring, and seal fisheries. Pop. 3172.

Magdeburg, the capital of Prussian Saxony, and one of the chief fortresses of the German empire, 90 miles by rail SW. of Berlin and 72 N. of Leipzig. It lies in a cheerless country, on the left bank mainly of the Elbe, which, here 280 yards wide, branches into three channels, and forms two islands. On the smaller of these still stands the Citadel (1683-1702); but otherwise the old fortifications have since 1866 been built over or converted into promenades, their place being taken by a cordon of thirteen forts. The cruciform Gothic cathedral, rebuilt between 1207 and 1550, is 400 feet long, and has two western towers 341 feet high. It contains the tombs of the Emperor Otho the Great, of his first wife, the English princess Editha, and of Archbishop Ernest, whose monument (1497) is a masterpiece of Peter Vischer of Nuremberg. In front of the town-hall (1691-1866) is the equestrian statue of Otho, dating, not from 973 as its inscription

claims, but from the close of the 13th century; and of several other monuments the most noteworthy are the Soldiers' Memorial (1877) and a statue of Luther (1886). The industries are of high importance, comprising huge ironworks, distilleries, cotton-mills, &c.; and the trade is correspondingly great—for sugar it is the first market of Germany. Magdeburg is the junction of five railways; and the river-trade is also very large. Pop. (1875) 122,789; (1890) 202,324, of whom over 10,000 were Catholics, and 2000 Jews. Founded by Charlemagne in 805, and refounded by Editha after its destruction by the Wends in 924, Magdeburg was in 968 made the seat of an archbishopric, and had 40,000 inhabitants in 1524, when, embracing the Reformation, it incurred the combined wrath of emperor and papate. It weathered the storm then, successfully withstanding Maurice of Saxony (1550); but during the Thirty Years' War it suffered fearfully. In 1629 it was vainly besieged for twenty-eight weeks by Wallenstein; in May 1631, after an heroic defence (2000 against 25,000), it was taken by Tilly and burned to the ground, the cathedral (reconsecrated for Catholic worship) and a few poor fisher huts being almost all that remained after the three days' sack, in which nearly the whole population of 36,000 perished by fire or sword or drowning in the river. In 1648 the archbishopric was converted into a secular duchy, and conferred on the house of Brandenburg in compensation for the loss of Pomerania. In 1803 the French annexed it to the Kingdom of Westphalia; but in 1814 it was finally restored to Prussia. See works by Hoffman (2d ed. 1885), Kawerau (1886), and Guericke (2d ed. 1887); and for the *Magdeburg Centenary*, see CHURCH HISTORY, Vol. III, p. 242.

Magdeburg Hemispheres are two hollow hemispheres, generally made of copper or brass, with their edges accurately fitted to each other, and one of them furnished with a stopcock. When

Magdeburg Hemispheres.

the edges are rubbed over with grease, pressed tightly together, and the globe thus formed exhausted of air through the cock, the hemispheres, which fell asunder before exhaustion, are now pressed together with immense force—e.g. if they are one foot in diameter, they will, after exhaustion, be pressed together with a force of nearly a ton. This experiment was first performed by Otto von Guericke (q.v.), burgomaster of Magdeburg, in 1659, at the imperial diet at Ratisbon, to the astonishment of the Emperor Ferdinand III. and his princes and nobles.

Magellan, FERDINAND (Portuguese *Magalhães* or *Magellans*), a famous navigator, was born about 1470, most probably at Villa de Sabrosa, near Villa Real in Feuzos Montes. He served with distinction in the East Indies, particularly at Malacca, and was banished for life in action in Morocco. Finding his sufferings rewarded with contempt by King Manuel he formally renounced his nationality, and together with his countryman, Roy Valera, a geographer and astronomer, offered his services to Spain. They laid before Charles V. a scheme for reaching the Moluccas by the west, which was well

received; and Magellan sailed from San Lúcar, 10th August 1519, with five ships of from 130 to 60 tons, and about two hundred and fifty men. Sailing to the mouth of the La Plata and along the shores of Patagonia, he threaded the strait which bears his name (21st October—28th November 1520), and entered on that vast ocean which he named the Pacific from the fine weather which he experienced there. He had already been troubled by mutiny, which he had crushed by swift vengeance upon the ringleaders, and after reaching the Philippine Isles he fell in an expedition against the natives of Mactan (27th April 1521). His ship, the *Victoria*, was safely navigated by Sebastian del Cano home to Spain, and thus completed, on 6th September 1522, the first voyage ever made round the world.

The best contemporary account of Magellan's famous voyage is that by Antonio Pigafetta, a volunteer in the fleet. An English version of this and five minor narratives is Lord Stanley of Alderley's *First Voyage round the World by Magellan* (H. Kluwert Society, 1874). See Guillemaud, *Magellan and the Pacific* (1891).

MAGELLAN STRAIT, separates South America on the south from Tierra del Fuego. It is 375 miles in length, and its breadth varies for the most part between 12 and 17 miles. It was discovered by Magellan in 1520, and first thoroughly explored by King and Fitzroy in the *Adventure* and *Beagle* (1826-35). The wider eastern half is bordered by level, gently-rolling grassy plains. The narrower western half is shut in by steep, wooded mountains; the current runs strong through it, and the west winds are a great hindrance to sailing-vessels. There are several fine harbours along this part of the strait. See works by R. O. Cunningham (Edin. 1878) and A. W. Miller (Portsmouth, 1884).

Magellanic Clouds, or **NEBULÆ MAJOR** and **MINOR**, two cloudy masses of light seen at night in the sky of the southern hemisphere. The greater lies between R.A. 4h. 40m. and 6h., and N.P.D. 156° and 162°; the lesser between R.A. 0h. 28m. and 1h. 15m., and N.P.D. 162° and 165°. They are composed of complex masses of nebule and stars, condensed so as to give the naked eye the impression of a cloudy mass. See **NEBULÆ**.

Magendie, FRANÇOIS, an eminent French physiologist and physician, was born at Bordeaux, 15th October 1783; studied at Paris, became successively professor in anatomy (1804), physician to the Hôtel-Dieu, member of the Academy of Sciences (1819), and professor of Anatomy in the Collège de France (1831). He made important additions to our knowledge of nerve physiology, the veins, and the physiology of food, and wrote numerous works, including the *Elements of Physiology* (originally a précis, 1816, afterwards extended). He was likewise the founder, and for ten years the editor, of the *Journal de la Physiologie Expérimentale*, in which are recorded many of the experiments on living animals which gained for him, too deservedly, the character of an unscrupulous vivisector. He died 7th October 1855.

Magenta, an Italian town, 18 miles W. of Milan by rail. Pop. 5573. Here, on 4th June 1859, 55,000 French and Sardinians defeated 75,000 Austrians, the latter losing 10,000, besides 7000 prisoners, and the allies only 1000. For this victory MacMahon received his dukedom. For the coal for colour, see **DYEING**.

Magorö. See **NORTH CAPE**.

Maggiore, Lago, one of the largest lakes in Italy, the *Lacus Fimbrius* of the Romans, is situated for the most part in Italy, but also partly in the Swiss canton of Ticino. It is 39 miles in length, and varies in breadth from 3 mile to 5½ miles. It lies 616 feet above the level of the sea,

and has a maximum depth of 1158 feet. The river Ticino flows through it. In a south-western expansion of the lake are the Borromean Isles (q. v.). On the north and west it is surrounded by granitic mountains, 7000 feet high, on the south and east by vineyard-covered hills.

Maggot, the larva of most flies (Diptera), without limbs or distinct head. They feed on the animal material, often a corpse of some sort, in which they are laid. Some of the larger forms are used for bait or for feeding birds.

Magi. In Accadian, the language of the early Turanian inhabitants of Babylonia and Media, *magu*, signifying 'angust,' 'reverend,' was the title of their learned and priestly caste. The Semitic nations afterwards dominant in Babylonia and Assyria adopted the learning and many of the religious observances of the early inhabitants, as also the name for the learned caste; and out of the Semitic form the Greeks made *magos*. Under the Persian empire the magi were not only the 'keepers of the sacred things, the learned of the people, the philosophers and servants of God,' but also diviners and mantics, augurs and astrologers. They called up the dead by awful formulas, or by means of cups, water, &c. They were held in the highest reverence, and no transaction of importance took place without or against their advice. Hence their almost unbounded influence in both private and public life. Apart from the education of the young princes being in their hands, they were the constant companions of the ruling monarch. Of their religious system the articles PARSLES and ZOROASTER will give a fuller account. Zoroaster, in the course of his great religious reform, reorganised the body of the magi, chiefly by reinforcing the ancient laws as to their manner and mode of life, which was to be one of the simplest and severest, belittling their sacred station, but which had become one of luxury and indolence, and by re-instituting the original distinction of the three classes of *hurobs* ('disciples'), *mobeds* ('masters'), and *dshur mobeds* ('complete masters'). The food, especially of the lower class, was to consist only of flour and vegetables; they wore white garments, slept on the ground, and were altogether subjected to the most rigorous discipline. The initiation consisted of the most awful and mysterious ceremonies, and was preceded by purifications of several months' duration. Gradually, however, their influence, which was all-powerful during the epoch of the Sassanian kings of Persia, began to wane, and, from being the highest caste, they fell to the rank of wandering jugglers, fortune-tellers, and quacks, and gave their name (Magic, q. v.) to sleight-of-hand and conjuring tricks. But the name seems to have been also current as a generic term for astrologers in the East, as is evidenced by the New Testament narrative of the homage of the Magi to the Infant Christ.

According to the narrative (Matt. ii, 1-12) the three wise men came from the East to Jerusalem, led by a star, which at length guided them safely to the place of the Nativity at Bethlehem, where they offered their gifts of gold, frankincense, and myrrh. As the 'Three Kings' their names became celebrated in the middle ages, and Bede distinguishes them as Kaspar, Melchior, and Balthasar. The last was the Chaldean name for Daniel; Melchior signifies 'king of light'; Kaspar in some legends appears as Gathaspar, and in Syriac sources as Gudophorhem, in which we may perhaps recognise the name of the powerful Indo-Parthian king, Gondophares, said to have been baptised by the apostle Thomas. The bones of the three kings are claimed to be deposited in the cathedral at Cologne. In the calendar the three days after New-year's

Day bear their names, and their memory is preserved in the feast of the three holy kings—the Epiphany. The youngest of the three is generally represented in works of art as a black man.

Magic, the pretended art of doing wonderful works by aid of mysterious supernatural means. The term is in general synonymous with sorcery, and was originally applied by the Greeks and Romans to that form of sorcery which was communicated by the Babylonian *Magi* to the Medes, Persians, and Parthians, and by them spread over the East and even the West. No people have carried magic to a greater height than the ancient Chaldeans, and many of their formulas of propitiation and expulsion of spirits and demons have been deciphered from the cuneiform inscriptions. They practised many forms of magic, but especially astrology, which was misused by a succession of astronomers to the dignity of a pseudo-science. In the same way Egyptian magic was formulated into elaborate system and ritual which far surpassed in completeness anything to be found among the ancient Greeks or Romans. The former held the same views of magic as the less cultured races around them, and the philosophy of the Pythagoreans and Neoplatonists carried mystical symbolism and magical speculations further into new regions of theurgy and thaumaturgy. Theurgic magic also was highly developed in Alexandria, and it descended into medieval and modern Europe bearing many marks of Jewish speculation.

Grimm says *Miracle* (*wundern*) is the salutary, Magic (*zöubern*) the hurtful or unlawful, use of supernatural powers; miracle is divine, magic devilish; not till the gods were degraded and despised was magic imputed to them. Man can heal or poison by directing natural forces to good or to evil; sometimes he even shares the gift of miracle; but when he pushes the beneficent exercise of his powers to the supernatural point, he learns to conjure. The origin of all conjuring must be traced directly to the most sacred callings, which contained in themselves all the wisdom of heathendom—viz. religious worship and the art of song. Sacrificing and singing came to mean conjuring; the priest and the poet, confidants of the gods and participants of divine inspiration, stand next door to the fortune-teller and magician. By the side of divine worship practices of dark sorcery grew up by way of exception, not of contrast. After the introduction of Christianity all heathen notions and practices were declared to be deceit and sinful delusion; the old gods fell back and changed into devils, and all that pertained to their worship into devilish jugglery. Presently there sprang up tales of the Evil One's immediate connection with sorcery and witchcraft; and out of this proceeded the most incredible, most cruel jumbling up of imagination and reality. The great distinguishing mark of sorcery was the desire to work mischief, and thus this delimitation involves the same ethical condemnation which made Plato denounce sorcery as an illegitimate method of forcing the power of the gods into the service of man. It was from the beginning the inveterate antagonist of religion, originating in dim and confused yet independent glimpses into the secrets of nature; and throughout it we trace the elemental idea of an opposition to the divine will, it being implied that the power of influencing and altering his physical conditions rests within the power of man himself. The sorcerer stands aloof from the ordinary adoration of supernatural powers, employing occult faculties and devices which he supposes to be within his own control. Hence sorcery early becomes differentiated from religion—on the one side legitimate means of contact with the divine, as adoration, inspiration, vows, oracles, miracles,

omens, and signs; on the other, thaumaturgy by occult, incomprehensible arts, skill in natural magic, mesmerism, mumbo-jumbo, and imposture. Originally magic was the rudimentary beginning of medicine and science, but soon it fell back into occult and mystic devices, while two elements present in its first inception—the religious sentiment and real experimental knowledge—developed into morality and science. Magic, says Bastian, is the physics of mankind in the state of nature. It rests on the beginning of induction, which remains without result only because in its imperfect judgments by analogy it raises the *post hoc* to the *propter hoc*. The notion that the gods were indifferent to the fate of mortals opened a door to sorcery for finding relief from suffering, but gradually the deteriorating influences made way and the criminal side of the miraculous became specially the function of the eratt. Modern India, says Sir Alfred Lyall, swarms with astrologers, soothsayers, and interpreters of dreams, who watch nature to ascertain the will of the gods; but these are quite distinct from the sorcerers, who work independently of them, and soon become knaves and cheats, religious and medical, preying upon the ignorance of their dupes. Among the Mohammedans magic is rife, though condemned by rigid divines; and almost everybody believes in the efficacy of amulets, charms, spells, exorcism, magic mirrors, cabalistic figures, divination, sortilege, and the like. If a man devotes the power he acquires to good ends he is held comparatively innocent; but he may go on to acquire the power of commanding the evil genii to do him all kinds of wicked service, which is execrated as black or Satanic magic.

The superstition of magic and witchcraft belongs essentially to the lower levels of civilisation, and the reputation of it clings to any survivors of an older nationality, like the Lavas of Burma and the Finns and Lapps among their Scandinavian neighbours. Even in Scotland robust Presbyterians long thought more highly of the Popish priests than of their own clergy for casting out devils, laying ghosts, and curing madness. All magical reasoning is based upon the inherent belief of primitive man that casual connection in thought is equivalent to causal connection in fact. The savage ever confounds an ideal with a real connection; he confuses subjective and objective relations. To him it is merely a matter of experience that all nature is personal and animate, and that human agencies can work supernaturally. He is constantly seeking an explanation of physical facts, and he fills up his scanty knowledge of natural causes with hypothetical causes of a metaphysical and supernatural character. This confusion of imagination and reality produces a state of mind capable of accounting for the whole business of magical arts and magical relations, the only real connection between which is mere analogy and symbolism. Coincidences ever strike the primitive man as things in themselves significant, and *post hoc ergo propter hoc* is to his mind a perfectly valid logical method. Nor does his sorcerer always need to be successful—one lucky hit outweighs half a dozen failures, and the sorcerer, through a kind provision of nature, usually ends with being himself more or less the dupe of his own powers. Thus magic may develop into elaborate and systematic pseudo-science, a sincere though fallacious philosophy evolved by processes in great measure still intelligible to our own minds. Augury, divination, oneiromancy, chiromancy, and astrology admitted of being gravely formulated and discussed, and even among 19th century Englishmen and Americans may be seen not a few strange revivals of magicians like Apollonius

of Tyana and Iamblichus, as well as of savage philosophy and peasant folklore, in the freaks of so-called spiritualism, with its voices, its spirit-writing, its untying of ropes, and its rising and floating in the air.

The primitive mind ever needs material support for the religious sentiment, and in this constant condition we find the foundation of fetishism and idolatry. Everywhere the savage sees a connection between an object and a visible representation of it; hence the philosophy of making an image of a person to be injured by burning it, melting it away, or sticking pins into it—of which we have still a surviving shadow in our custom of burning an unpopular person in effigy. Again, a disease tormenting a man may be driven into an image of clay or the like, and in the same elemental idea of connection between object and image we find explanation of the fear of clippings of the hair or parings of the nails falling into the possession of an enemy, our own lingering liking for locks of hair of those we love, as well as many of the usages of early medicine, sympathetic powder, love-potions, the doctrine of Signatures (q.v.). A similar connection exists somehow between a thing and its name; hence a man may be bewitched through a wicked use of his name, and a sorcerer may force the hand of a divinity by invoking with his name. Accordingly, in the history of primitive religions we find the most sacred names kept strictly secret, as by the Jews, Moslems, and the Romans of their tutelary deity.

Magic was strictly condemned under the Levitical law, and by the early Christians was regarded as unlawful miracle. In the middle ages it continued to be studied in its less harmful sides, as astrology and alchemy, and it must not be forgotten that in the one department it was the parent of scientific astronomy, in the other of modern chemistry. Yet the reign of imperfect analogy has given way but slowly before a real scientific method; and though the old theory of demoniacal possession has been exchanged for a real knowledge of the laws that govern lunacy, and occult sympathetic operations have widened out into the vast sciences of pharmacy and medicine, yet primitive magical conceptions still cling closely to our people, and form everywhere the heart of popular folklore.

See the articles ALCHEMY, ANIMISM, ASTROLOGY, DEMONOLOGY, DIVINE DIVINATION, FETTERISM, FOLK-LORE, IDOLATRY, INCANTATIONS, and WITCHCRAFT; also EMMENAGER, *Geschichte der Magie* (2d ed. 1844; trans. by W. Howitt, 2 vols. 1854); Maury, *La Magie et l'Étiologie* (4th ed. 1877); Lenormant, *La Magie chez les Chaldéens* (1874; Eng. trans. 1877); Victor Rydberg, *Magie of the Middle Ages* (Eng. trans. New York, 1879); and Fabart, *Histoire philosophique et politique de l'Occulte, Magie*, &c. (1885); also Caspari, *Ursgeschichte der Menschheit* (2d ed. 1877), and Tyler's *Early History of Mankind* (chap. vi.) and *European Culture* (chap. iv.). Horst's *Zauberabhandlung* (6 vols. Manz, 1820-26) is a perfect cyclopaedia of the doctrine and methods of magic; a complete bibliography of its literature is Grasse's *Bibliographie der neuesten in das Gebiet des Zaubers, Geistes, und sonstigen Aberglaubens einschlagenden Werke* (Leip. 1843).

Magic Lantern, an optical instrument said to have been invented by Athanasius Kircher in 1646, by means of which magnified images of small pictures are thrown upon a wall or screen. The instrument consists of a lantern containing a powerful argand lamp or lime-light arrangement (see LIME LIGHT); in the side of the lantern is inserted a horizontal tube, the axis of which is on a level with the centre of the flame, and the light is generally made to pass through the tube by reflection from a concave mirror placed on the opposite side of the lantern. The tube is furnished with two lenses, one at each end; the inner one, the condenser, is a large lens

of short focus, to condense a strong light on the picture, which is inserted into the tube, between the lenses, through a transverse slit. The other end of the tube is fitted with a double convex lens, or, better, a corrected combination of lenses, which receives the rays after passing through the picture, and throws them upon the screen or wall. The pictures are formed on glass slides—generally $3\frac{1}{2}$ inches square—with transparent coloured varnish or by means of photography on a collodion, gelatine, or carbon tissue film on the glass, and must be inserted into the tube in an inverted position, and with the film or painted side nearest the screen, in order that the images may appear erect and un-reversed. If the screen on which the image is thrown be at too great a distance, the image will become indistinct from the lessened intensity of the light. This instrument is sometimes used as a toy, but is also frequently employed to produce enlarged representations of astronomical and other scientific diagrams, and enlargements of photographic views, so that they may be well seen by an audience. Phantasmagoria, dissolving views, &c. are produced by a particular manipulation of the same instrument.

Magic Squares are sets of different numbers, each column of which, whether horizontal, vertical, or diagonal, adds alike.

1	1872	10	8
12	6	3	1870
7	9	1873	2
1871	4	5	11

Fig. 1.

420	508	453	510
523	449	471	457
479	441	539	492
469	502	428	492

Fig. 2.

The above are two examples of a magic square with the same summation (in either case 1891). Considering the difficulty with which a person without previous knowledge could make even one such square, it may surprise many to hear that there are more than 700,000,000,000,000 (seven hundred billion) magic squares of this sort (4), with the summation of 1891, each composed of different numbers, or with a different arrangement of the same numbers. Fig. 1 is so constructed that a great variety of other squares may be made from it by altering the four highest numbers in it. Thus, if 13, 14, 15, and 16 be substituted for 1870, 1871, &c. respectively, we get the smallest 4-square possible, with the summation 34. It was at one time thought that magic squares could only be composed of arithmetical or other symmetrical series of numbers; but an examination of Fig. 2 shows that that idea was erroneous.

Within the compass of a short article it is impossible to describe adequately any of the many rules for making magic squares. The following figures will, however, give some idea of the most important method, that of superposition, invented by De la Hire. It is most readily applied to odd squares, more especially to those whose roots are prime numbers. We therefore take the 5-square for our example.

1	3	5	2	4
5	2	4	1	3
4	1	3	5	2
3	5	2	4	1
2	4	1	3	5

Fig. 3.

5	0	15	10	20
10	20	5	0	15
0	15	10	20	5
20	5	0	15	10
15	10	20	5	0

Fig. 4.

Each row of the above squares contains the same

numbers and in the same order relatively to one another. But in fig. 3 the first number of each row is the same as the *third* of the row above, whilst in fig. 4 it is the *fourth*. If now these two squares be combined by adding together the numbers that are in corresponding cells, the resulting square will be magic. In this case it will have the summation of 65, and the top row will be 6, 3, 20, 12, 24. By altering the positions of the numbers in the top rows, and making corresponding alterations in the others, 3600 distinct varieties of this magic square may be obtained.

Although numerous persons have written on magic squares (among whom may be mentioned Leibnitz, Frenicle, De Morgan, Bachet, Ozanam, Montucla, Frost, and Cramé), the literature on the subject is by no means easily accessible. Perhaps the best known work is Hutton's *Mathematical Recreations*; and in this will be found descriptions of other kinds of magic squares, such as the Bordered and Tessellated, which may briefly be described as magic squares within magic squares. *Nasik* magic squares (so named by Frost from his place of residence in India) are squares whose magicality is not destroyed by repeatedly removing the first column or row to the last place, or *vice versa*. All squares with prime roots, made by De la Hire's method of superposition, are *nasik*. Even squares can also be made *nasik*. Fig. 1, with the numbers 13, 14, 15, and 16 substituted for the four highest, makes a *nasik* square.

Magilp. or MEGILP, a composition used by artists in oil-colours as a medium and for glazes. It is made of linseed-oil and mastic varnish. Robertson's medium, which is similar but dries quicker, is now more used than magilp.

Magilus, a remarkable Gasteropod found on the coral reefs of warm eastern seas. The young animal settles on the growing coral at the obvious risk of being gradually surrounded and smothered. This is avoided, however, by an entire change in the form of the shell, which is diverted from its original spiral type and grows out into a long irregular tube. 'A neck-and-neck race is kept up until the mollusc or the coral dies.' As the tube lengthens sometimes to 2 or 3 feet the animal shifts into it completely, and the original whorls are filled up with lime.

Maginn, WILLIAM, one of the most brilliant writers of his day, born at Cork, 10th July 1793, the son of a schoolmaster, and educated at Trinity College, Dublin, where he graduated B.A. in 1811, and left a brilliant reputation for precocious scholarship. At twenty-six he received his degree of LL.D. from his college, being the first who had ever received it so young. He taught in Cork for ten years, and in 1823 removed to London to pursue the life of letters. His first contribution to *Blackwood's Magazine*—a Latin translation of *Cherry Chase*—appeared in 1819, and from that date for nine years scarcely a number appeared without an article from his pen. In 1821 Murray started the short-lived *Representative*, a daily newspaper, and Maginn was sent to Paris to act as foreign correspondent. In 1828 he joined the staff of the *Standard*, and was one of the originators of *Fraser's Magazine* in 1830. His contributions to *Fraser* were as 'lively, learned, and libellous' as those to *Blackwood*, and one led to a harmless duel between the author and the Hon. Grantley Berkeley. The remainder of Maginn's career was irregular and unhappy. His habits of intemperance gained the mastery over him, and he was often arrested and in jail for debt, without losing, however, in the least his brightness or good-humour. He wrote his *Shakespeare Papers* for Blackwood in 1837,

and in 1840 he began his *Magazine Miscellanies*, by *Doctor Maginn*, which did not extend beyond ten numbers. In 1842 he was again imprisoned in the Fleet, and, having passed through the bankrupt court, was reduced in fast failing health to a state of great poverty. Help came from Sir Robert Peel almost too late, for poor 'bright, broken Maginn' died at Walton-on-Thames, 21st August 1842. He wrote two forgotten romances, *Whitehall, or the Days of George II.* (1827, a parody on the historical novel, and Horace Smith's *Brambletop House* in particular), and *John Manesty* (1844), completed after his death by Charles Ollier. His *Homeric Ballads* were published in 1849. A collection of his papers was edited by R. S. Mackenzie (5 vols. New York, 1855-57); and his *Miscellanies, Prose and Verse*, by R. W. Montagu (2 vols. Lond. 1885).

Magistrate. See BOROUGH, and JUSTICE OF THE PEACE.

Magliabechi. ANTONIO, bibliophile, was born at Florence in 1633, and till his fortieth year was a goldsmith. From youth upwards, however, he displayed an inordinate passion for the acquisition of book-knowledge; and, having mastered Greek, Latin, and Hebrew, he literally entombed himself among books, of which disorderly piles encumbered every portion of his dwelling. In his daily habits he grew regardless of the decencies of life; and such was his avidity of study that he finally denied himself even the requisite intervals of repose. His memory was prodigious, and enabled him not only minutely to retain the contents of his multitudinous books, but also to supply, on occasion, the most exact reference to any particular page or paragraph, the place of each book being indicated with precision in the midst of their seemingly inextricable masses. Magliabechi was regarded as the literary prodigy of his times. In 1673 he was appointed court-librarian by the Grand-duke of Tuscany; and the many tributes of respect tendered by royal and distinguished personages to his wonderful erudition fostered in an inordinate degree his love of fame and praise, which rendered him intolerant of literary merit in others, and involved him in several bitter literary squabbles. He died at Florence on 4th July 1714, leaving no written record of his immense encyclopædic knowledge. His valuable library of 30,000 vols. he bequeathed to the Grand-duke, who made it over to the city of Florence; it is now a fine library, and bears the name of its collector. See John Hill Burton's *Book-Hunters* (1862).

Magna Charta. the Great Charter granted by King John of England to the barons, has since that time been viewed as the basis of the English constitution. The oppressions of a tyrannical sovereign compelled a confederacy of the barons or tenants-in-chief of the crown, who took up arms for the redress of their grievances. They demanded the restoration of the laws of Edward the Confessor and Henry I.; laws which combined Norman feudalism with Saxon and Danish institutions. A conference was held at Runnymede, on the Thames near Egham, where king and barons encamped opposite each other; and, after several days' debate, John signed and sealed the charter with great solemnity on 15th June 1215.

The Great Charter provided against the abuse of the royal prerogative by protecting the rights and obligations of the feudal proprietor. It redressed a variety of grievances connected with feudal tenures, some of which are long since obsolete. Minute provisions were made regarding the ward, relief, and marriage of heirs, and rights of their widows. No sentence or aid was to be imposed without the authority of the common council of the kingdom,

except on the three great feudal occasions of the king's captivity, the knighting of his eldest son, and the marriage of his eldest daughter. The liberties of the city of London and other towns, burghs, and ports were declared inviolable. Freedom of commerce was guaranteed to foreign merchants. Justice was no longer to be sold, denied, or delayed. The Court of Common Pleas, instead of, as formerly, following the king's person in all his progresses, was permanently fixed at Westminster, assizes were appointed to be held in the several counties, annual circuits established, and regulations made for the efficiency of the inferior courts. Life, liberty, and property were protected from arbitrary spoliation, and none was to be condemned to forfeit these but by lawful judgment of his peers or by the law of the land. No one was to be condemned on rumours or suspicions, but only on evidence of witnesses. Fines imposed were in all cases to be proportioned to the magnitude of the offence, and even the villain or rustic was not to be deprived of his necessary chattels. The testamentary power of the subject was recognised over part of his personal estate, and the rest was to be divided between his widow and children. The independence of the church was also provided for.

These are the most important features of that Charter which occupies so conspicuous a place in history, and which establishes the supremacy of the law of England over the will of the monarch. A charter was at the same time granted to mitigate the oppressions of the Forest Laws (q.v.). The terms dictated by the barons to John included the surrender of London to their charge, and the Tower to the custody of the primate till the 15th of August following, or till the execution of the several articles of the Great Charter. Twenty-five barons, as conservators of the public liberties, were empowered to make war against the sovereign in case of his violation of the Charter. Several solemn ratifications were required by the barons both from John and from Henry III.; and a copy of the Great Charter was sent to every cathedral, and ordered to be read publicly twice a year. The copy preserved in Lincoln Cathedral is regarded as the most accurate and complete; and a fac-simile of it was published by the Records Commissioners in 1865. See Bishop Stubbs's *Selct Charters* (1870).

Magna Græcia (Gr. *Μαγνητ. Ελλάς*), the name given in ancient times to the Greek colonies of Southern Italy. The appellation must have been current at an early period. Polybius says it was used in the time of Pythagoras. Some writers include under the term the Greek cities in Sicily, others restrict it to those situated on the Gulf of Tarentum; but in general it is used to denote all the Greek cities in the south of Italy, exclusive of those in Sicily. The oldest settlement is believed to have been Cumæ, though it is doubtful whether it and its colonies, Dicearchia and Neapolis, were really embraced under the designation Magna Græcia. The period assigned to its foundation soon after the Trojan war is obviously fanciful. The other more important Greek settlements in Italy were Sybaris (founded by the Achæans, 729 B.C.), Croton (by the Achæans, 710 B.C.), Tarentum (by the Spartans, 707 B.C.), Locri (by the Locrians, 710 B.C.; according to others, thirty or forty years later), Rhegium (by the Chalcidians; date of origin not known, but believed to be earlier than Sybaris), Metapontum (by the Achæans, 700 B.C.), Siris (by Ionians; date unknown), and Velia (by the Phœceans, 540 B.C.). These cities became in their turn the parents of many others. Of the earlier history of Magna Græcia very little authentic information has survived. The settlements appear to have risen rapidly to power and wealth, partly by the brisk commerce which they

carried on with the mother-country, and partly also, it is conjectured, by an amalgamation with the Pelasgic (and therefore kindred) natives of the interior, as at Lœri. About 530 B.C. Pythagoras, the philosopher, arrived at Crotona, and soon acquired supreme influence in Magna Grœcia, though it did not last long. The quarrels between the different cities were often bitter and bloody; the most notable cases were the destruction of Siris by the Achaean cities and of Sybaris by Croton (510). Besides this they were hotly pressed at times by the Lucanians and Bruttians; and finally, 272-271 B.C., the Romans conquered the whole of Lower Italy. Long before this several of the cities had disappeared. The longest to survive was Tarentum.

See the separate articles on the cities; also Lenormant, *La Grande Grèce* (3 vols. 1881) and *Les Grecs d'Asie Mineure* (2 vols. 1883), or the more popular *Land of Magnolia*, by Mrs. Janet Ross (1889).

Magnesia. See MAGNESIUM.

Magnesia, an ancient city of Ionia in Asia Minor, situated nearly 10 miles N.E. of Miletus in the valley of the Meander. It was a wealthy and prosperous city until after it fell into the hands of the Romans, in spite of its having been destroyed during the Cimmerian invasion about 660 B.C. Here stood a famous temple to Artemis, the remains of which have been excavated; and here Themistocles, the Athenian patriot and statesman, died (449 B.C.). It was called *Magnesia ad Meandrum*, to distinguish it from another, *MAGNESIA AD SIPYLUM*, which stood on the Hermus, near Mount Sipylus. Beside this town Scipio defeated Antiochus of Syria in 190 B.C. It is now called Manissa, and is a town of 50,000 inhabitants, 41 miles N.E. of Smyrna by rail.—The easternmost division of ancient Thessaly in Greece also bore this name.—To one of the places called Magnesia, most probably that in Lydia, we owe the terms magnet, magnetism, magnesia, and apparently also manganese.

Magnesian Limestone. See DOLOMITE.

Magnesium (sym. Mg, equiv. 24) is a metal which is very widely distributed over the globe. It is present in many minerals—e.g. dolomite—a carbonate of lime and magnesia; asbestos—a silicate of lime and magnesia; and meerschaum—a silicate of magnesia. It exists in mineral waters and in the sea as sulphate, and as chloride, the former being known as Epsom salts. It was from the Epsom spring, in 1695, that Drew extracted this well-known salt, and in the beginning of the 18th century *Magnesia alba*, so called to distinguish it from what was already known as *Magnesia nigra* (black oxide of manganese, so called from its resemblance in colour, weight, &c. to the magnet) was discovered. The metal was first prepared by Davy, and for long its manufacture was limited to a small scale. Now, however, it is made in quantity by fusing together the chlorides of potassium and magnesium and fluor spar, and adding metallic sodium with great care. The crude metal is finally distilled and pressed in a semi fluid state into ribbon or wire.

Magnesium has a silver-white colour, which is tarnished by moist air. It is a very light metal, its specific gravity being only 1.75. It is readily volatile, and, when lighted, burns in air with an intensely brilliant light rich in chemical rays. On this account it was, till superseded by the electric light, much used in photography, while in signalling and pyrotechny it plays an important part.

When magnesium burns in air it forms a white ash consisting of the oxide, magnesia, MgO (which may be also prepared by heating the carbonate). This is a very infusible substance, and is much

used in medicine under the name of calcined magnesia. The carbonate, MgCO₃, is found in nature, but for medical purposes it is prepared by precipitating a soluble magnesium salt with carbonate of soda. According as it is prepared in the hot or cold, the resulting carbonate forms the ponderous and dense or the light variety. Although insoluble in water, this substance readily dissolves in water containing carbonic acid, and this solution is known as fluid magnesia. The sulphate, MgSO₄·7H₂O, or Epsom salts, occurs in nature, and is well known as a domestic remedy. It is much employed in febrile affections, but it may be used in any case in which a mild but efficient laxative is required. Its dose varies from ʒ to ʒi ounce, but in order to promote its full efficacy it should be taken along with copious draughts of water. In combination with infusion of senna it forms the ordinary black draught. Magnesia and the carbonate are employed in small doses as an antacid, but in larger quantity they have a distinct purgative action. Fluid magnesia (see above) is a valuable aperient for women and children. Citrate of magnesia is the popular name for a granular, effervescent aperient, now much in use. It consists of a mixture of bicarbonate of soda, tartaric and citric acids, sugar, and a small trace (1 to 5 per cent.) of Epsom salts.

Magnetic Belts. See ELECTRICITY (MEDICAL).

Magnetism (*magis* or *lithos magnētēs*, 'the loadstone,' probably first found at Magnesia in Lydia). Magnets are natural (Loadstone, q.v.) or artificial, permanent (steel masses magnetised by the action of other magnets or of an electric current) or temporary (soft iron masses magnetised by magnets, or the so-called electro-magnets, soft iron masses round which a current is passing).

Polarity of the Magnet.—When a small soft iron, nickel, or cobalt ball is suspended by a thread, and a magnet (fig. 1) is passed along in front of it from one end to the other, the ball is powerfully attracted towards the ends, but not at all by the middle of the magnet. The points of the magnet towards which the attractive power becomes greatest are called its poles. By causing a small magnetic needle moving horizontally to vibrate in front of the different parts of a magnet placed vertically, and counting the number of vibrations, the rate of variation of the attractive power may be exactly found. When the poles of one magnet are made to act on those of another a striking dissimilarity between the poles is brought to light. To show this, let us suspend a magnet, NS, fig. 2, by a band of paper, M, hanging from a cocoon thread (a thread without torsion); or let us pivot it, or lay it on a float on water. When the magnet is left to itself it takes up a fixed position, one end keeping north, and the other south. The north pole cannot, except in unstable equilibrium, be made to stand as a south pole, or *vice versa*; for, when the magnet is disturbed, both poles return to their original positions. Here, then, is a striking dissimilarity

Fig. 1.

Fig. 2.

in the poles, by means of which we are enabled to distinguish them as *north pole* and *south pole*. When thus suspended, let us now try the effect of another magnet upon it, and we shall find that the pole of the suspended magnet which is attracted by one of the poles of the second magnet is repelled by the other, and *vice versa*; and where the one pole attracts, the other repels. If, now, the second magnet be hung like the first, it will be found that the pole which attracted the north pole of the first magnet is a south pole, and that the pole which repelled it is a north pole. We thus learn that *each magnet has two poles, the one a north, and the other a south pole, alike in their power of attracting soft iron, but differing in their action on the poles of another magnet, like poles repelling, and unlike poles attracting each other.*

The attractions and repulsions are found in a bar magnet to follow the same laws of distribution as would have been obeyed by the forces due to two equal isolated discs, the one attracting, the other repelling, and situated at points a little short of the extreme ends of the bar; and the places where these imaginary discs of imaginary magnetic matter would be are called the poles of the magnet. This conception of imaginary magnetic matter greatly facilitates many calculations, and is largely applied. It is as if the one kind of pole consisted of positive, the other of negative matter; and the north pole of a magnet is, in accordance with this order of ideas, conventionally termed the positive pole.

No Isolated Poles.—If we try to cut a bar-magnet so as to isolate the poles, we find that each half has developed a new pole at the broken end, and each half has become a separate magnet whose poles are equal to one another, and to the poles of the original magnet. *We can therefore never have one kind of magnetism without having it associated in the same magnet with an equal amount of the opposite magnetism.*

The Earth a Magnet.—The fact of the freely suspended magnet taking up a fixed position has led to the theory (Gilbert, q.v., in 1600) that the earth itself is a huge magnet, having its north and south magnetic poles in the neighbourhood of the poles of the axis of rotation, and that the magnetic needle or suspended magnet turns to these as it does to those of a neighbouring magnet. All the manifestations of terrestrial magnetism (q.v.) give decided confirmation of this theory. It is on this view that the French call the north-seeking pole of the magnet the south pole (*pôle austral*), and the south-seeking the north pole (*pôle boréal*); for, if the earth be taken as the standard, its north magnetic pole must attract the south pole of other magnets, and *vice versa*. In England and Germany the north pole of a magnet is the one which, when freely suspended, points to the north, and no reference is made to its relation to the magnetism of the earth.

Fig. 3.

Fig. 3 is a horseshoe magnetic magazine. The central lamina protrudes slightly beyond the other, and it is to it that the armature is

attached, the whole action of the magnet being concentrated on the projection. The magnetic needle is a small single permanent magnet nicely balanced on a fine point. See COMPASS.

The Magnetic Field. The region surrounding a magnet (even, to a diminishing extent, to an infinite distance) is in a peculiar condition. If a magnet be laid under a piece of glass and soft iron filings be sprinkled on the glass, each filing will assume a particular direction; and the whole congeries will map out the lines of the directions in which small magnets will be made to point by the play of the magnetic forces existing around the magnet, in the magnetic field of that magnet.

Fig. 4.

These directions are the Lines of Force in the magnetic field filling all space; and an example of them is given in fig. 4, which shows the arrangement of the filings above a bar magnet, laid parallel to the glass. In a horseshoe magnet the strongest part of the field extends to the magnet is that lying between the poles; the lines of force are there crowded together.

Magnetic Induction.—These lines of force external to the magnet are also Lines of Induction. In the direction of the lines of induction a magnetic separation tends to be set up; the soft iron filings are each converted, while in the neighbourhood of the magnet, into temporary magnets, each with a north and a south pole; the one pole is repelled, the other attracted; on the whole each filing is swivelled round into the direction of the local line of force. Similarly, a bar of soft iron becomes, while in contact with a magnet, as in fig. 5, or to a

Fig. 5.

less extent when in its neighbourhood, itself a temporary magnet; and it may in its turn magnetise and support other bars, so that a chain of soft iron bars may, up to a limiting weight, be supported on a magnet. Steel bars are slower than soft iron in taking up a magnetic condition, and the harder their temper the slower they are in doing so; but, unlike soft iron, they do not readily lose what they have acquired; they become permanent magnets, while soft iron retains magnetism only precariously and easily loses it when mechanically disturbed. Specially soft iron may lose the whole when struck; ordinary wrought-iron will generally retain traces of residual magnetism, the amount of which depends on the previous magnetic history of the particular bar. The characteristically magnetic substances are iron, nickel, and cobalt; but many others, even liquids (such as solutions of salts of iron) and gases (such as ozone), are attracted by the magnet.

Diamagnetism. Most substances are (in the form of spheres) feebly repelled by magnets, and bars of them lie across the lines of induction in a non uniform magnetic field. These substances are said to be diamagnetic, e.g. bismuth.

Magnetisation by the Earth. The inductive action

of terrestrial magnetism is a striking proof of the truth of the theory already referred to, that the earth itself is a magnet. When a steel rod is held in a position parallel to the Dipping-needle (q.v.) it becomes in the course of time, and the sooner if struck with a hammer, permanently magnetic. A bar of soft iron held in the same position is more powerfully but only temporarily affected. We may understand from this how the tools in workshops are generally magnetic. Whenever large masses of iron are stationary for any length of time they are sure to give evidence of magnetisation, and it is to the inductive action of the earth's poles acting through ages that the magnetism of the loadstone is probably to be attributed.

Preservation and Power of Magnets.—Even steel magnets, freshly magnetised, sometimes gradually fall off in strength, till they reach a point at which their strength remains constant. This is called the *point of saturation*. If a magnet has not been raised to this point it may lose nothing after magnetisation. We may ascertain whether a magnet is at saturation by magnetising it with a more powerful magnet, and seeing whether it retains more magnetism than before. The saturation-point depends on the material of the magnet itself. When a magnet is above saturation it is soon reduced to it by repeatedly drawing away the armature from it. After reaching this point magnets will keep the same strength for years together, if not subjected to rough usage. It is favourable for the preservation of magnets that they be provided with an armature or keeper. The power of a horseshoe magnet is usually tested by the weight its armature can bear without breaking away from the magnet. Small magnets are much stronger for their size than large ones. The reason of this may be thus explained. Two magnets of the same size and power, acting separately, support twice the weight that one of them does; but if the two be joined, so as to form one magnet, they do not sustain the double, for the two magnets, being in close proximity, act inductively on each other. The north pole of the one tends to repel the adjacent magnetism of the contiguous north pole of the other, and to form by induction a south pole in its place; the magnets thus weaken one another. Similarly, several magnets made up into a battery have not a force proportionate to their number. Large magnets, in the same way, may be considered as made up of several laminae, whose mutual interference renders the action of the whole very much less than the sum of the powers of each. The best method of ascertaining the strength of bar-magnets is to cause a magnetic needle to oscillate at a given distance from one of their poles, the axis of the needle and the pole of the magnet being in the magnetic meridian. These oscillations observe the law of pendulum motion, so that the force tending to bring the needle to rest is proportionate to the square of the number of oscillations in a stated time.

Action of Magnets on each other.—Coulomb discovered, by the oscillation of the magnetic needle in the presence of magnets in the way just described, that *when magnets are so placed that two adjoining poles may act on each other without the interference of the opposite poles* i.e. when the magnets are large compared with the distance between their centres *the attractive or repulsive force between two magnetic poles varies inversely as the square of the distance between them*. Gauss proved from this theoretically, and exhibited experimentally, that when the distance between the centres of two magnets is large compared with the size of the magnets i.e. when the action of both poles comes into play *the action of two magnets on each other varies inversely as the cube of the distance between*

them. This variation in the strength of the field may be shown either by the oscillation experiments above referred to, or by direct observation of deflections produced at different distances. The action on a magnet in a uniform magnetic field is that of a couple, like that of the hands on a copying-press. There is rotation, but no translation, unless the field falls off in strength from the position of the one pole to that of the other.

Effect of Heat on Magnets.—When a magnet is heated to redness it loses permanently every trace of magnetism; iron, also, at a red heat, ceases to be attracted by the magnet. At temperatures below red heat the magnet parts with some of its power, the loss increasing with the temperature. The temperatures at which other substances affected by the magnet lose their magnetism differ from that of iron. Cobalt remains magnetic at the highest temperatures, and nickel loses this property at 662° F.

Electric Relations of Magnetism.—Every electric circuit is a closed loop of some form or other. Every such loop bearing a current has round it a magnetic field; and such a single loop is equivalent to a thin disc, or shell of any form, cut out of a large bar-magnet, and has a south and a north aspect. The lines of induction pass, say, from the north face outwards, filling all space, and return to the south face, threading the loop, so that each line

Fig. 6.

of induction is a closed curve. The lines of induction immediately surrounding the wire are, if the circuit be large enough, circular in form. If wire bearing a current be coiled into a helix or solenoid (left-handed, fig. 6; right-handed, fig. 7), the helix

Fig. 7.

acts in respect to bodies external to it exactly in all respects as a bar-magnet would do: the strength of the equivalent magnet being in proportion to the strength of the current passing. The magnetic field surrounding a current-bearing loop or helix is called an *Electro-magnetic Field*; and it is identical with the field which might be produced by a sufficiently magnetised mass of the same contour: the difference being that, since currents may be made very strong, 'electro-magnetic' fields can be made more intense than any magnetic fields obtainable from steel magnets. These phenomena have led up to Ampere's theory of magnetism.

Ampere's Theory of Magnetism.—Ampere considers that every particle of a magnet has closed

Fig. 8.

Fig. 9.

currents circulating about it in the same direction. A section of a magnet according to this theory is

shown in fig. 8. All the separate currents in the various particles may, however, be considered to be equivalent to one strong current circulating round the whole (fig. 9). Before magnetisation the molecules lie in different directions, so that the effect of the currents is lost, and the effect of induction is to twist the molecules round so as to bring the currents to run in the same direction. The perfection of magnetisation would be to render all the various currents parallel to each other. Soft iron, in consequence of its offering less resistance to such a disposition, becomes more powerfully magnetic under induction than steel, in which considerable resistance to this displacement of the molecules exists, and which, when this deformation has once been produced, retains it to a considerable extent, this being the cause of permanent magnetism. This displacement of the molecules upon induction is often accompanied by a tick, or by a mechanical twist or an alteration in length and thickness.

Currents may also, it is probable, be induced by a magnetic field in the several molecules of a substance non-magnetic or not; and, as these are so directed as to oppose the magnetic field, we will, if we postulate the absence of resistance to them, arrive in non-magnetic substances at a state of things in which the stresses in the magnetic field and those in the substance acted upon by induction are opposed; and this will give rise to the phenomena, and may provide an explanation, of diamagnetism, which is, so far as is known, a property of bodies only found manifested within a magnetic field.

Magnetic Induction inside a Helix.—The interior of a current-bearing helix is a very powerful magnetic field, the most powerful part of the whole electro-magnetic field of the helix, since all the lines of induction are concentrated within it. Soft iron then becomes, instantly on the passage of a powerful temporary magnet, or 'electro-magnet,' as it is called, which falls off in power instantly on the current being stopped; steel becomes permanently magnetised. Fig. 10 shows

Fig. 10.

how the wires may be arranged to magnetise a horseshoe-bar.

The current of the helix, acting on the individual currents within the molecules, places them parallel to itself, and the result is that the soft iron comes to act as a magnet, stronger than any steel magnet. So long as the process of setting the molecules in position is far from being completed, i.e. so long as the iron is not 'saturated'—the strength of the magnetism induced in the core is approximately in proportion to the strength of the current and the number of turns in the coil. Another result is that on introducing a soft iron core into a current-bearing helix the lines of induction, which are due to the induced current of the soft iron molecular currents, are added to those of the inducing field, so that the whole field is greatly strengthened.

Magnetic Attractions and Repulsions of Currents.—The stresses in the magnetic field are such as to make all lines of induction from various sources coincide as far as possible in direction; and hence circuits tend to place themselves, as far as possible, coincident with one another in respect of form and parallelism of current. It is not difficult

to show that this tendency results in movements the same as those which would be produced if linear currents in the same direction (parallel, convergent, or divergent) mutually attracted one another, and currents in opposite directions repelled one another. When a circuit is in part flexible, the flexible part being a wire or even merely a line of discharge through air, it tends either to expand or to contract in area, so that it may come, as near as may be, to meet these conditions; and the result is that similarly directed currents or parts

of the same current move into the closest possible proximity to one another. This is illustrated by fig. 11, in which the course of the current is shown by arrows; the movable part of the circuit, poised on mercury cups, will rotate in a magnetic field so as to tend to make the direction of its own lines of induction coincide with the direction of the lines of induction of the magnetic or electro-magnetic field, and thus to make its own contour embrace as many as possible of the lines of induction of the field, if their general trend coincide with its own, or as few as possible if they be opposed; and, consequently, if a wire in which a current passes downwards be placed vertically near *ed*, the lines of induction round that wire and those round *ed* coincide in general direction, and *ed* appears to be attracted by the wire; while if the current pass upwards *ed* is repelled, and *ef* attracted. Place, now, the wire below and parallel to *de*. If the current passes in the direction *d* to *e* no change takes place, as the attraction cannot show itself; but if the current moves from *e* to *d* the whole turns round till *d* stands where *e* was, and both currents run the same way. If the wire be placed at right angles to *de*, the rectangle turns round and comes to rest when both currents are parallel and in the same direction.

Fig. 11.

According to Ampère's theory, the earth, being a magnet, has currents in it which are equivalent to currents circulating about it; these must be from east to west, the north pole of the earth being, in our way of speaking, a south pole. A magnet, then, will not come to rest till its own lower currents place themselves parallel to and in the direction of the earth's currents. This is shown in fig. 12, where a section of a rectangular bar-magnet is represented in its position of rest with reference to the earth current. The upper current, being farther away from the earth current, is less affected by it, and it is the lower current that determines the position. A magnetic needle, therefore, turns towards the north to allow the currents moving below it to place themselves parallel to the earth's current. This also is shown by the current-bearing rectangle in fig. 11, which comes to rest in

how the wires may be arranged to magnetise a horseshoe-bar.

Fig. 12.

to show that this tendency results in movements the same as those which would be produced if linear currents in the same direction (parallel, convergent, or divergent) mutually attracted one another, and currents in opposite directions repelled one another. When a circuit is in part flexible, the flexible part being a wire or even merely a line of discharge through air, it tends either to expand or to contract in area, so that it may come, as near as may be, to meet these conditions; and the result is that similarly directed currents or parts

stable equilibrium, in the absence of any external current, when d and e lie east and west.

The Measurement of Magnetic Data. This has largely had its terminology evolved with reference to the equivalence of magnetic forces and phenomena to those which would be evinced if 'magnetism' were a kind of matter, positively or negatively attracting and resident in the poles. A *pole of unit strength* is one which attracts or repels another equal pole, situated at a distance of one centimetre, with a force of one dyne. The *magnetic moment* of a magnet is the strength of either pole multiplied by the distance between the two poles. This can be measured directly. The *intensity of magnetisation* of a bar magnet is the magnetic moment divided by its volume. A *magnetic field of unit strength or intensity* at any particular point is a field in which at that point a unit pole would be pulled upon or repelled with a force of one dyne; and conversely, the intensity of a uniform magnetic field may be measured by finding the mechanical couple acting on a magnetic needle, freely suspended in it. The intensity of induced magnetisation produced by putting a long bar of a magnetisable substance in a uniform magnetic field of unit strength measures the *magnetic susceptibility* of that substance. The force within the substance of an induced magnet, due both to the inducing field and to the surrounding magnetised substance, when the inducing field is unity, measures the coefficient of magnetic induction or the *magnetic permeability* of the substance. The *strength of a magnetic disc or shell* is its magnetic moment per unit of area, if this be uniform.

Magnetic Measurement of Electric Data.—Given a magnetic shell of given outline and strength, its action upon a magnetic needle placed within its field can be observed; and conversely, from its outline and its deflecting action its strength can be calculated. An electric current of the same contour can have its intensity so regulated as to produce the same magnetic effect as the magnetic shell did upon the needle in one position; and if in one, then in every position; and the intensity of that current is said to be, in magnetic measure, numerically the same as the magnetic strength of the equivalent magnetic shell. This is the basis of a system of electric units, called magnetic or electro-magnetic units of electric quantities; and convenient multiples and submultiples of these arrived at by substituting for the centimetre, the gramme, and the second, as the units of length, mass, and time, 1,000,000,000 cm., the $\frac{1}{1000}$ th part of a gramme and the second as these fundamental units are in use as the practical units for electrical measurement. These are the *ampere*, the unit of current intensity; the *ohm*, that of resistance (= the resistance of about 106.2 cm. pure mercury column, 1 sq. mm. in transverse section; defined as that of 106 cm. by the Paris International Electrical Congress); the *volt*, that of potential difference or 'electromotive force' (= approximately that of a Daniell cell, in which the liquids are a saturated solution of nitrate of copper and dilute sulphuric acid, 1 acid to 22 water); the *coulomb*, that of electric quantity; the *farad*, that of capacity; and the *quadrant*, that of self-induction.

Self-induction. When a current is suddenly started in a coil of wire, the ultimate result is to set up a magnetic field. But, while this is being set up, energy is being absorbed by the field, and the current falls short of its full intensity. Similarly, when the current ceases this energy is restored, and the current seems piled up as if it had momentum of its own like water in a hydraulic ram. The stronger the magnetic field that will be produced the more lines of induction will thread

the coil—the more marked is this effect; and this exaggeration is brought about by multiplying the turns in the coil (keeping down the resistance, if necessary, by increasing the thickness of the wire used), or by inserting a core of soft iron, or both.

Induction of Currents in Magnetic Field.—Lay two circuits in one another's neighbourhood. The sudden production or increase of current in the one will produce a brief current in the other in such a sense that there is mechanical repulsion between the induced current and the originating one; the cessation or diminution of the primary current induces, in the opposite sense, a brief current in the secondary circuit. These are phenomena of the magnetic field of the primary circuit; and the primary circuit can be replaced by a magnet or electro-magnet, whose approach or strengthening induces brief currents in one sense, and whose recession or weakening induces brief currents in the opposite sense. No current passes in the secondary coil so long as the primary current or magnet remains constant or stationary. For the ways in which this production of a secondary current is utilised, see DYNAMO, INDUCTION. If we try to move a good conductor—a copper disc or a knife—in a strong magnetic field the motion is resisted or damped; the production of the induced currents generated by motion in the field absorbs energy.

Rotatory Features of Magnetism.—As a simple case, consider the field in the immediate neighbourhood of a linear current. The lines of magnetic force run in circles round the wire; a magnet pole tends to be driven in such a sense that, if it be positive or north-seeking, it will travel round an advancing current in the same sense in which the point of a corkscrew travels round the axis of the advancing corkscrew. If a magnet were flexible it would form a coil round the current; and conversely, a flexible current bearing wire tends to coil round a strong bar-magnet, and currents parallel to bar-magnets tend to rotate round the magnetic axis of the magnet.

Nature of the Magnetic Field.—All the phenomena of the magnetic field are explicable as due to whirlpool currents of electricity in closed vortex-rings, the axes of which are the magnetic lines of induction. The reaction of tendencies to the formation of these vortex-rings from different sources results in the production of local variations of stress in the ether which result in attractive and repellent movements between currents or magnets, or between currents and magnets, or in the production of currents, or of magnetic induction; and the resultant forces are along the axes of the whirls which tend to shorten themselves longitudinally and to spread out laterally. The electric displacements in the whirls are therefore at right angles to the lines of magnetic force. With other dispositions of the magnetic field we have other forms of the lines of force; but they are always closed curves which mark the axes of vortex motions or shears, and which lie wholly in air, or partly in air and partly in metal or other substance.

Electro-magnetic Propagation. When a disturbance is set up in one place which leads to the formation of a magnetic field, the change from the original condition of the ether to the complex condition which is known as 'magnetic field' is marked by a magnetic or *electro-magnetic propagation* of the disturbance; and the theoretical velocity of this propagation has been shown to be about 300,000 kilometres per second, which is practically exactly the same as the speed of the propagation of light. In a linear current the direction of the current is the direction of propagation; the disturbance is propagated in the ether, not in the conductor; and the magnetic and electric displace-

ments are at right angles both to the direction of propagation and to one another. Without a linear conductor to guide the propagation the disturbance is propagated equally in all directions; and Clerk-Maxwell advanced the proposition that light is a phenomenon of this order, an electro-magnetic phenomenon involving vortical stresses, rather than the mere vibration of an elastic ether. This proposition has been strikingly confirmed by the researches of Hertz in 1888. He found that by producing waves of electro-magnetic propagation of periodic disturbances he could reproduce with long waves, which he found to travel at the predicted rate, the phenomena of reflection at the surface of a conductor, refraction, polarisation, interference, &c., which are manifested by those short and frequent ether-waves which give rise to the phenomena of light and radiant heat; and his results have shown that the plane of magnetic disturbance, at right angles to that of electric disturbance, is the analogue of the plane of polarisation, which must be at right angles to the plane of vibration. By Hertz's researches the science of light has been made a part of the general science of electro-magnetism.

Magnetism, ANIMAL. See ANIMAL MAGNETISM and HYPNOTISM.

Magnetism, TERRESTRIAL. Under the general article MAGNETISM the broad fact that

the earth is a magnet has been incidentally touched upon. In this article we propose to consider in more detail the magnetic features of the earth as a whole. In studying the magnetic field associated with the earth we are confined to its surface, and are unable to trace the lines of force throughout their whole length. We believe, however, that these lines of force have the properties of all lines of force associated with magnets. In general they pass by continuously curved paths from regions in the southern hemisphere to regions in the northern hemisphere. The southern hemisphere, therefore, is the seat of what is called northern or positive magnetism.

The direction of the line of force at any point is given by the direction in which a perfectly free magnet placed there will point (see MAGNETISM). To obtain the direction of the earth's magnetic force we must suspend the magnet accurately by its centre of mass, as in the apparatus known as the Dipping-needle (q.v.). With such an apparatus, let us, beginning at the extreme south point of Africa, move northwards and study at each successive stage the behaviour of the magnet. At first it will be found to make an angle of about 57° with the horizontal, pointing upwards towards the north-west. This angle of 57° is called the dip, and will steadily diminish as we pass northwards, until, a little to the south-east of Lake Chad, the magnet will be found to rest perfectly horizontal. Proceeding still northwards, we shall find the magnet beginning to tilt again, but this time with the north-pointing end downwards. As we leave the north coast of Africa in 20° E. long. the dip will be nearly 45°; it will be 55° as we enter Turkey, gradually increasing to nearly 77° as we leave the north coast of Norway. Very similar changes in dip will occur as we pass along any

Fig. 1.—Lines of equal Magn. Dip. 1887.

longitude line. The general features are shown in fig. 1, reduced from Neumayer's chart for 1885, as given in the new edition of Berghaus' *Physikalischer Atlas*. Each line is drawn through all places at which the dip has the value indicated by the number attached. The only points requiring

particular remark are the position of the line of zero dip, and the position of the point of maximum dip. The line of zero dip is called the magnetic equator. Its non-coincidence with the geographical equator indicates a marked departure of the earth's magnetic condition from the magnetic condition of a

uniformly magnetised sphere, whose magnetic axis coincides with the polar axis. The position of maximum dip shown is where the needle points vertical with its north end downwards. It is called the magnetic north pole, and is situated in the north of Canada in 97° W. long., and 70½° N. lat. There is also a magnetic south pole, which is believed to lie somewhere near 150° E. long. and 73° S. lat. The magnetic poles do not, therefore, lie exactly at the extremities of a diameter. It should be noted that the dip is the angle between the line of force at a given locality and the horizontal plane there; that is, the dips in different latitudes are referred to different planes. Fig. 2, which represents the section of the earth along the great circle passing through the geographical and magnetic north poles, will serve to indicate the approximate relative positions of the lines of force. The directions of these at latitudes 0°, 30°, and 60° are indicated by arrows, the dotted

Fig. 2.

lines giving the directions of the true vertical at the various points. AB is the geographical polar axis, S the 'magnetic north pole'—really analogous to the so-called south pole of a magnet.

00° are the points of zero dip, where the lines of force will be roughly parallel to the magnetic axis.

Returning again to the southern extremity of Africa, let us consider more fully the position of the magnet hanging freely by its centre of mass. To fix this position we require to know not only the dip but also the geographical lie of the vertical plane in which the magnet hangs. This is given by the Declination (q.v.), which may be defined as the angle between the meridian plane and the vertical plane parallel to the magnetic axis of the free-hanging magnet. Practically this angle is determined by a magnet suspended or pivoted so as to lie horizontally, and is what every mariner's compass gives more or less accurately. Near Capetown the declination is fully 30° west of north (NNW½W.); but as we pass northwards it gradually diminishes, until on the Mediterranean shore in 20° long. it becomes only 8° west of north (N½W.). Passing farther north we find it still diminishing, but more slowly, until finally, as we leave the north coast of Norway in the same longitude, it is found to be 6° (N½W.). The general features of the declination are shown in fig. 3. Each isogone or line of equal declination passes through localities at which the declination had the value as marked in 1885. This figure is also reduced from Neumayer's chart. It will be seen at a glance that the surface of the globe is divided broadly into two regions, separated by the agonic lines (marked thick) or lines of no declination. The one region, including the Atlantic with the whole of Africa and a large part of the Indian Ocean, is characterised by a westerly declination; and the other (with an interesting exception) an easterly declination. These are indicated by arrow-heads appropriately directed.

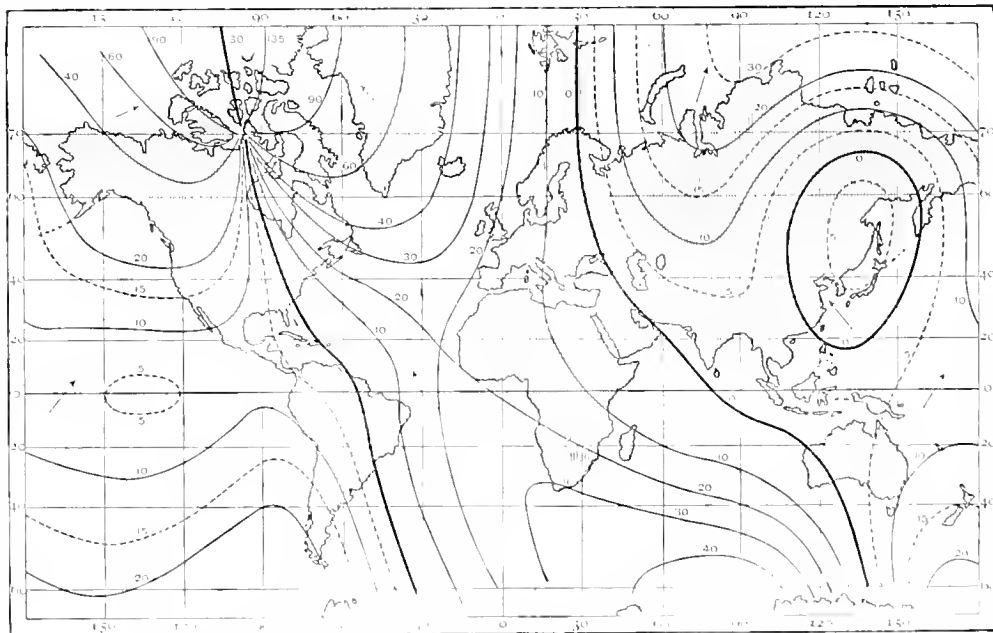

Fig. 3.—Lines of equal Magnetic Declination, 1885.

The western boundary of the region of westerly declination passes through the magnetic north pole. This line passes through the localities where the magnet points true geographical north. It continues itself northwards towards the geographical pole as the isogone of 180°, since any magnet, set between the magnetic pole and the geo-

graphical pole, will turn its marked end towards the south instead of towards the north. The eastern boundary of western declination passes northwards from Europe till, at the geographical north pole, it meets the short isogone of 180° just mentioned. After its south-easterly sweep across the Indian Ocean this line of zero declination

passes through the western portion of Australia and finally ends at the 'magnetic south pole.' Continuing as the isogone of 180° till it reaches the geographical south pole, it joins with the other boundary line of zero declination. It will be readily seen that the region of western declination is more contracted than the other; but, as if to balance this, there is an isolated region of western declination situated in the midst of the region of eastern declination. This isolated region lies on the east of Asia, and is enclosed in an oval-shaped agonic line (marked with a thick line in the chart). Declination charts for all seas and shores are invaluable to the practical navigator, by whom they are called variation charts. From them he learns at a glance in what direction the magnetic needle points at the place he happens to be in, and can steer his desired course accordingly. For example, in a voyage from England to India by way of Suez, the western declination diminishes rapidly from 17° at Gibraltar to 5° at Suez. Before India is sighted the agonic line is crossed, and the declination becomes slightly easterly. Thereafter,

on as far as Hong-kong or Torres Strait, the compass points never so much as half a point to the east of north. Hong-kong is just outside the small isolated region of westerly declination, through which the route to Vancouver passes. As Vancouver is approached, however, the easterly declination rapidly increases to nearly 25°.

The declination and dip completely determine the direction of the line of force. Its strength or intensity still requires to be known before the magnetic conditions are completely fixed. The total force we may imagine to be determined by measuring the time of oscillation of a dipping-needle of known magnetic moment. Practically, however, it is easier and much more accurate to measure the horizontal component of the total force or intensity of the field. It is consequently more useful to construct a chart showing lines of equal 'Horizontal Force.' Such a chart is shown in fig. 4 (also from Neumayer's chart), each line being drawn through localities at which the horizontal force has the value as marked. The horizontal force must, of course, vanish at the

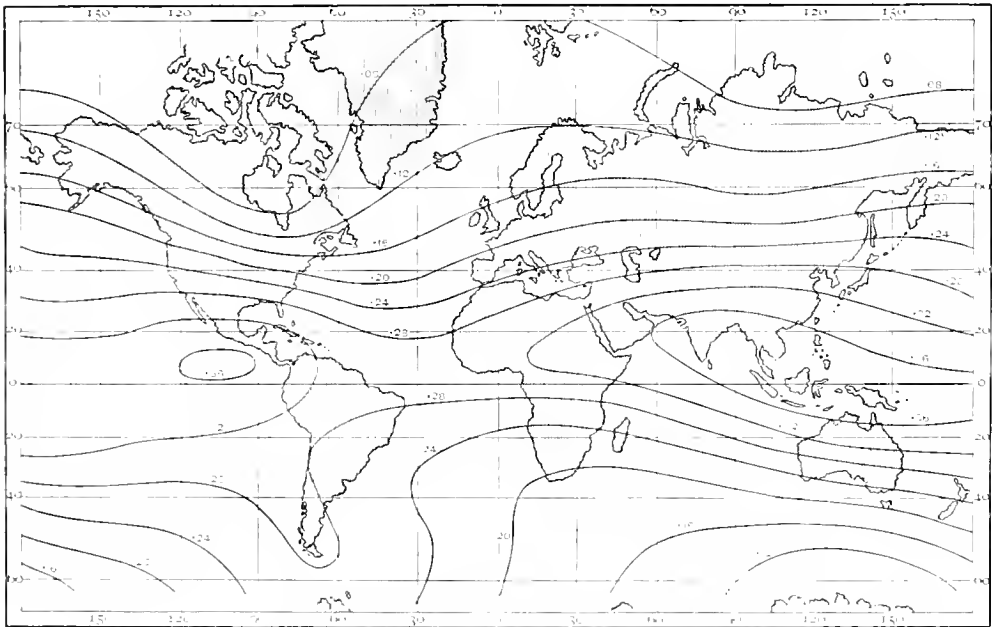

Fig 4.—Lines of equal Horizontal Force, 1855.

magnetic poles, which we originally defined as the regions where the dip was 90°. From figs. 1 and 4 taken together we may calculate roughly the total magnetic force at any locality, by multiplying the horizontal component by the secant of the angle of dip. Thus, for Edinburgh we have, roughly, $0.165 \times 3 = 0.49$; in Hudson Bay, $0.08 \times 9.5 = 0.76$; in Central Africa, where the magnetic equator cuts the 20° longitude line, $0.33 \times 1 = 0.33$. The total force, therefore, increases in a general way as we approach the magnetic poles. Its maximum values, however, are not exactly at these poles, nor do the positions of minimum value lie on the line of dip.

The declination, dip, and horizontal force are commonly called the magnetic elements. They are all subject to variations in time, so that magnetic charts for one epoch will differ somewhat from those for another epoch. For example, comparing the isogonic lines given in fig. 3 with the isogonic lines for 1810, we see that both the long agonic

lines have, for the greater part of their lengths, moved westwards, and the agonic oval has changed form slightly and moved a little eastwards. A line drawn from Nova Scotia to the Cape of Good Hope divides the Atlantic into two regions. In the north-eastern region the declination has been diminishing during the last twenty years, while in the south-western the declination has been increasing. There is some evidence of a periodic variation extending over several centuries. Thus, in 1600 the agonic passed to the west of England and through the Cape of Good Hope, the declination in England being about 8° east of north. In 1700 the westerly declination in England had become 6° or 7°, and that at the Cape about 12°. In 1800 the declinations had increased to 23° or 24° at the two places. All this indicates an eastward motion of the line of zero declination. Since 1818 the westerly declination in England and in western Europe generally has been slowly diminishing, showing that the agonic

line had ceased its easterly and begun its present westerly drift. In the charts published by the United States Coast and Geodetic Survey very full information is given regarding the westerly drift of the agonic line that passes through America. South of the Great Lakes its average rate of progress during the last forty years has been nearly five miles per annum. In 1890 the annual change of declination at places in the neighbourhood of the agonic line was about three minutes of arc, westerly increase. At Greenwich the present annual change is about seven minutes of arc, westerly decrease. The secular changes in the dip and horizontal force are very slight, and generally take place in opposite directions, so that the change in the total intensity is still smaller.

The solar diurnal variation of the magnetic elements, and especially of the declination, is the most easily recognised of all the periodic variations to which the earth's magnetism is subject. In all but tropical regions the declination needle oscillates markedly about its mean position for the day, attaining its maximum deviation from one to two hours after noon. In the northern hemisphere this maximum deviation is to the west of the mean position; in the southern hemisphere it is to the east. Again, the total range of variation is greater in the summer months than in the winter months. By an elegant development of Gauss's lawless theory of terrestrial magnetism Schuster has shown that the features of the solar diurnal variations of the different magnetic elements indicate causes above the earth's surface as the source of these variations. This accords with Balfour Stewart's hypothesis that the diurnal magnetic changes result from electric currents in the higher regions of the atmosphere. These currents are due to the action of the sun, and are probably associated with the currents of hot air which pass from the equatorial regions both northwards and southwards. That such electric currents do really exist is demonstrated by the existence of the aurora in higher latitudes; for this phenomenon is beyond question electrical. Further, distinct connection has been traced between auroral displays and magnetic disturbances of exceptional character (see AURORA BOREALIS). These irregular magnetic disturbances or magnetic storms, as they are called, are more frequent and more pronounced at times of maximum sun spots; and, according to Loomis, a great magnetic storm is always accompanied by an unusual disturbance on the sun's surface. Again, there is no doubt some connection between certain types of magnetic changes and earth-currents, the latter being particularly strong during magnetic storms; but it is now admitted by all authorities that earth-currents cannot be regarded as an efficient cause of the magnetic disturbances.

In addition to the well-marked solar-diurnal variation of the magnetic elements, there is also a lunar-diurnal variation, which has been specially studied by Broun and Chambers. These and other phenomena of terrestrial magnetism show that the earth is magnetically sensitive to cosmic influences. These influences may be directly magnetic; or, as is more probable in the case of the solar-diurnal variations, they may give rise to meteorological changes involving electric and magnetic actions. As to the ultimate origin of the earth's magnetism as a whole it is not possible, in the present state of the science, to formulate any satisfactory hypothesis. The rotation of the earth, which is so important a factor in the broad meteorological features that exist over the earth's surface, is the only dynamic polarity that can be compared to the magnetic polarity. According to the nebular hypothesis the earth's rotation is a

part of a grand circulatory motion of the solar system. So may the earth's magnetism be a part of the general magnetic conditions of the same system. If such a view is too vague for acceptance, the only hypothesis which seems to meet the case is that suggested by Balfour Stewart, who traces the magnetic condition of the earth to the terrestrial meteorological system, as modified by the earth's rotation, acting cumulatively through the ages.

Magnetite. See LOADSTONE.

Magneto-electric Machine. See DYNAMO-ELECTRIC MACHINES.

Magnetometer is, in general, any instrument for measuring magnetic force, or for comparing one magnetic force with another. A freely-suspended magnet, whereby the strength and direction of the lines of force in a magnetic field may be ascertained by observing the position assumed by a freely-suspended magnet and also its rate of oscillation and the amount to which it is deflected when under the influence of a second magnet, is the essential feature of all magnetometric instruments. The peculiar importance to us of the earth's magnetic field has, however, led to the construction of instruments of precision, to which the name Magnetometer is specially applied.

In a magnetic observatory the self-registering magnetometers or magnetographs form an extremely important set of instruments. By these the quick changes in the intensity of the earth's magnetic field and in the declination are registered by photographic means. The essential feature of the method is the reflection of a beam of light from a mirror attached to a magnet, which is suspended or pivoted so as to be sensitive to changes in the particular element that is being measured.

Magnificat, the 'song of the Virgin Mary,' which, in the Vulgate, begins with *Magnificat*. See BREVIARY.

Magnifying Glass. See LENSES, MICROSCOPE.

Magnolia, a genus of beautiful trees of the natural order Magnoliaceæ, having a calyx of three sepals, a corolla of six to twelve petals, and carpels in spikes arranged in cones, and opening at the dorsal suture. They are natives chiefly of North America, the Himalaya Mountains, China, and Japan. The flowers are large and solitary; the leaves generally large, in some species evergreen, in others deciduous. The wood is in general

Magnolia grandiflora.

soft, spongy, and of little value. *M. grandiflora*, sometimes called the Laurel-leaved Magnolia, has white flowers of great size. It is an evergreen tree about 20 feet high, with magnificent laurel-like

leaves, found in the lower districts from North Carolina to the Gulf of Mexico. It succeeds well as an ornamental tree in the south of England, but in Scotland requires a wall and some protection in winter. *M. tripetala* is found on the Alleghany Mountains, and extends as far north as lat. 43°. From the radiated manner in which its leaves are disposed at the extremities of the branches it has received the name of Umbrella Tree. It has very large white flowers. It is one of the species most commonly cultivated in Britain, but in Scotland it requires a wall. *M. acuminata* inhabits the same districts, and is a lofty tree with greenish-yellow flowers. It endures the climate of Britain well, but its flowers are not so much admired as those of some of its congeners. *M. glauca*, a native of Pennsylvania, Virginia, and the Carolinas, is known by the names of *White Bay*, *Beaverwood*, and *St. John Sassafras*. It is a tree or shrub of 15 to 20 feet in height, with very beautiful and fragrant white flowers. The Yulan, or Chinese Magnolia (*M. Yulan* or *conspicua*), has been much cultivated in China for more than twelve hundred years on account of its beautiful and fragrant white flowers, which it produces in great profusion. It is one of the finest ornamental trees, and succeeds well in the south of England. It is a deciduous tree, and the flowers expand before the development of the leaves. *M. caroliniana*, one of the finest species known, is a predominant tree in some parts of the Himalaya Mountains, at an elevation of 7000 to 8000 feet, the mountains, when it is in blossom, appearing as if sprinkled with snow. *M. Campbellii*, another native of the same region, produces great rose-colored flowers, and is described by Hooker as the most superb of the genus. The bark and fruit of all magnolias possess tonic bitter properties, and the bark of some of the species, particularly that of *M. glauca*, is used in domestic medicine in the marshy districts of North America in cases of rheumatism and fever. *Michelia* and *Manglietia* are closely allied genera. The natural order Magnoliaceae is closely allied to Ranunculaceae, differing chiefly in the arborescent habit, and in the large stipules which envelop the young leaves before they open, but soon fall off. The leaves are simple. Aromatic properties are prevalent. To this order belong the Tulip Tree, Star Anise, and Winter's Bark.

Magnus, St., a Scandinavian Earl of Orkney who in 1114 was assassinated in Egilshay Island by his cousin Haco.

Magnus or **MAGNI**, **OLAFS**, Swedish historian, was born at Linköping in 1490, and became secretary to his elder brother Johannes, Archbishop of Upsala. At the Reformation both brothers went abroad, and ultimately settled in Rome. On the death of Johannes, Olaf became titular archbishop, and died in 1558. Both brothers wrote on Swedish history; the famous work of Olaf is his *Historia de Gentibus Septentrionalibus* (1555).

Magpie, or **PIE** (*Pica*), a genus of birds of the family Corvidae (q. v.), distinguished from the true crows by their small size, long tail, short wings, and variegated plumage. The only British species is the Common Magpie (*P. rustica*), common in Britain, very abundant in Ireland, and found in almost all parts of Europe, in Asia as far as India, China, and Japan, and in the northern parts of North America from the Pacific to Michigan. It is from 16 to 18 inches long, the longest tail-feathers sometimes measuring 11 inches in length. It is of a glossy black plumage, slightly greenish and violet on the crown and back, with a slightly coppery tinge on the head; rump gray; shoulder-feathers and under surface of body white; wings and tail blue, green, and white; bill, legs, and feet

black. The female is slightly smaller than the male and less brilliant in plumage. The magpie is a shy, mischievous bird, extremely vigilant and cunning, both in eluding enemies and in seeking its own food. It is generally seen in pairs, but

Common Magpie (*Pica rustica*).

occasionally in large flocks. Its note is a harsh chatter, kept up as long as any obnoxious person or animal is near its haunts. In diet it is almost omnivorous, living on snails, slugs, worms, frogs, rats, mice, and the eggs and young of poultry. It builds its nest usually in the fork of a tree at some distance from the ground, but sometimes on low hedges and thorn bushes, or even on the ground. In Norway and Sweden, where it is favoured, it may be found nesting near houses on low goose-berry bushes. Its nest is large and dome-shaped, made of sticks cemented with clay and lined with fine roots and dried grass. It is strongly fortified with rough thorns, so as to resist the attacks of other animals, and even the action of the small shot which gamekeepers fire into it when they suspect it to contain young birds. The eggs are from six to nine in number, of a pale bluish green or yellowish-white, spotted with olive-brown. The mother shows great attachment to her progeny. The magpie is easily tamed, becomes impudently familiar, and learns to articulate a few words. Both in its wild and tame state it has a propensity to seize and carry off bright and glittering articles and hide them. The genus *Pica* consists of nine species, very widely distributed in Europe, Northern Africa, Asia north of the Himalayas, in Arctic America, and California.

A great wealth of popular superstition has clustered round the magpie or *pyot*, and almost universally it is considered as in a special sense a bird of evil omen. In Germany, Sweden, and Brittany it is closely connected with witches and with the devil, and it is unlucky to kill one, except during the twelve days between Christmas and Epiphany in Sweden and North Germany, and during the month of March in Thuringia. Popular reasons for the bird's persistent wickedness, in the north of England, are: because it was the only bird that would not go into the ark with Noah; because it is a hybrid between the raven and the dove; because after the crucifixion it alone of all the birds did not go into full mourning. Its appearance and the numbers seen at one time are always significant. There are many variants (some even contradictory), but the following is in good belief in the north of England:

One is sorrow, two is mirth,
Three a wedding, four a birth,
Five heaven, six hell,
Seven the devil's ain sel.

Wordsworth, in the *Excursion*, has alluded to the auspicious omen of seeing two magpies cross one's path, and Sir Humphry Davy, in *Salmonia*, has made it reasonable by linking the fact with the goodness of the weather.

Maguey. See AGAVE.

Magyars. See HUNGARY.

Mahabaleshwar, the chief sanatorium of the Madras Presidency, on the eastern slope of the Western Gháts, at a height of 4717 feet, and 74 miles S. of Poona. Pop. 3500.

Mahábhárata (meaning probably 'the great history of the descendants of Bharata') is the name of one of the two great epic poems of ancient India; the other being the *Rámáyana* (q.v.). In its present condition the epos consists of a hundred and ten thousand couplets, each containing thirty-two syllables; but there is ground for believing that it was formerly known in other recensions of a still greater extent. In its actual shape it is divided into eighteen parvans or books, the Harivansa being considered as a supplementary part of it. That this huge composition was not the work of one single individual, but a production of successive ages, is manifest from the multifariousness of its contents, from the differences in style, and even from the contradictions which disturb its harmony. Hindu tradition ascribes it to *Vyása*; but as *Vyása* means 'the distributor or arranger,' and as the same individual is also the reputed compiler of the Vedas, Puránas, and several other works, it is obvious that no historical value can be assigned to this generic name. The contents of the Mahábhárata may be distinguished into the leading story and the episodical matter connected with it. The former is probably founded on real events in the oldest history of India, though in the epic narrative it will be difficult to disentangle the reality from the fiction. The story comprises the contest of the celebrated families called the Kauravas and Pandavas, ending in the victory of the latter, and in the establishment of their rule over the northern part of India. Kurn, a descendant of Bharata, had two sons, Dhritarashtra and Pándu. Dhritarashtra's sons, the Kauravas, were a hundred in number; Pándu's, the Pandavas, only five. Pándu having resigned his throne, Dhritarashtra, though blind, assumed the government, and ultimately divided his kingdom between his sons and the sons of Pándu. The former, however, coveting the territory allotted to the Pándu princes, endeavoured to get possession of it. A game of dice was the means by which they bound over their cousins to relinquish their kingdom, promising, however, to restore it to them if they passed twelve years in the forests, and a thirteenth year in such disguises as to escape detection. This promise was faithfully kept by the Pándavas; but when the term of their banishment had expired the Kurn princes refused to redeem their word. A war ensued, ending in the complete destruction of the Kauravas. Duryodhana and his brothers are pictured as the type of all conceivable wickedness, and the Pándu princes as paragons of virtue and heroism, and the incarnations of sundry deities. Out of the hundred and ten thousand couplets which constitute the great epos barely a fourth part is taken up by this narrative; all the rest is episodical. The matter incidentally linked with the main story may be distributed under three principal heads: one comprising narratives relating to the ancient or mythical history of India, as, for instance, the episodes of Nala and Sakuntalá; a second is more strictly mythological, comprising cosmogony and theogony; a third is dialectic or dogmatic—it refers to law, religion, morals, and philosophy, as in the *Bhagavad-Gítá*,

for instance. By means of this episodical matter, which at various periods, and often without regard to consistency, was superadded to the original structure of the work, the Mahábhárata gradually became a collection of all that was needed to be known by an educated Hindu; in fact, it became the encyclopædia of India.

The text of the Mahábhárata was published in Calcutta in four quarto volumes (1834-39), another edition at Bombay in 1863, and another, under native Hindu auspices, at Calcutta in 1882 and succeeding years. The French translation by Fauche (10 vols. 1865-70) is incomplete; a complete English prose translation by Hindus, of which, up to 1890, 50 parts had appeared, was published and distributed, chiefly gratis, at Calcutta, under the auspices of Pratápachandra Roy. Many episodes, as the *Bhagavad-Gítá*, have been separately edited and translated. See Lassen's *Altertumskunde*; H. H. Wilson's works; Monier Williams, *Indian Epic Poetry* (1863); Wheeler, *The Vedic Period of the Mahábhárata* (1867).

Mahádeva ('the great god') is one of the usual names by which the Hindu god S'iva is called. See SIVA.

Mahánadí ('the great river'), a river of India, rises in the Central Provinces, in 20° 16' N. lat., 82° E. long. After an eastward course of 520 miles, 300 miles of which are navigable, having divided into several branches at or near the town of Cuttack, which forms the head of its delta, it flows east and south-east through the district of that name, and falls by several mouths into the Bay of Bengal. The catchment basin of the Mahánadí is less than 44,000 sq. m., yet its maximum discharge in time of flood equals that of the Ganges—1,800,000 cubic feet per second—and exceeds that of the Mississippi. An elaborate system of canals has been constructed to take advantage of this abundance.

Mahanoy' City, a mining town of Pennsylvania, 109 miles by rail NW. of Philadelphia, with a score of collieries and several manufactories. Pop. 7181.

Maharajah. See RAJAH.

Mahávausa, two celebrated works written in Páli, and relating to the history of Lanka, or Ceylon, from its earliest period down to the reign of Mahásena, who died 302 A.D. The first thirty-eight chapters were published in 1837 by G. Turnour; and there is an edition of the whole in Páli and Singhalese (Colombo, 1877-83).

Mahávíra (literally, 'the great hero') is the 24th or last Jina, or deified saint, of the Jains (q.v.). His legendary history is given in the *Kalpa-Sútra* and the *Mahávíra Charitra*, two works held in great authority by the Jains.

Mahdí (pass. part. of Arab *hadá* = 'he guided'; 'the well-directed one'), the Mohammedan restorer of all things. Though not mentioned in the Koran, he is said to have been promised by Mohammed to complete his work in filling the world as full of righteousness as it is of iniquity. The idea is that of the Jewish and Christian Messiah and of the Zoroastrian Saoshyant. Some need for reform soon made the idea practical. The first three califs were by Ali's party regarded as usurpers; and after Ali's reign and murder that party grew in number and in determination to recognise as Imám or calif none but Ali's heirs. Mohammed, a son of Ali though not of Fatima, but of 'the Hanafite,' bore unwillingly the name of Mahdí, and dying in peace he was expected to return. The Shia or party of Ali consisted mainly of Persians. This race opposed the Omniades because these were unprincipled men and half heathen, because they were their foreign tyrants, and because as usurpers they had broken through the divine right of heredity. The

Abbasides who, descended from the prophet's uncle, expelled and destroyed the Omniades by aid of the Shia were as much the enemies of these as their predecessors had been. The seventh Shiite Imam was poisoned by Haroun Abraschid the eighth by his temporarily Shiite successor Almanin; the ninth, tenth, eleventh followed the same path of martyrdom. The twelfth, Mohammed by name, disappeared after captivity at the age of twelve years in 879. The Shiite inference is that he, the 'hidden Imam,' will yet come as Mahdi to destroy the false prophet and, with the help of Jesus, to destroy or convert to Islam all mankind, and to put all wrongs right. Then will follow the resurrection and the final judgment. The native princes of Sofi's line who mastered the Persian throne in 1505 called themselves the lieutenants of the coming Mahdi. From the Isma'ilis (q.v.) in North Africa arose another Mahdi, from whom sprang the Fatimide califs. The seventh of these was Hakim, one of God's incarnations that had previously been Ali. He died, 'became hidden,' in 1020, and is expected by his sect the Druses. Among the Berbers of Mount Atlas in the 12th century arose another Mahdi, by name Mohammed ibn Tumert, whose disciple and successor Abdulmumin overran Morocco and supplanted the Almoravid dynasty there and afterwards in Spain. Hence the Almohade ('Unitarian') dynasty. The year 1666 produced in Turkey its Jewish Messiah, Sabbatai Zevi, and in consequence its Kurdish Mahdi for the suppression of this Dejjal, or false prophet. Both fell quietly into the sultan's hands. In 1799 another Mahdi arose in Egypt, against the French, and fell in battle. In Dongola, towards 1843, was born Mohammed Ahmed. He was for a time in the Egyptian civil service, but disagreeing with the governor, he became a trader and a leading slave-dealer. About the prophetic age of forty he claimed to be the Mahdi. Gradually at the Mahdi's call—the Muslim equivalent for a revolutionary spirit—the Eastern Soudan stirred itself against Egyptian misrule. In 1883 he seized El-Obeyd, the chief city of Kordofan, and made it his capital; and on the 5th November of that year the Egyptian army commanded by Hicks Pasha was annihilated. In 1885 Khartoum was taken by treachery, and General Gordon, whom Britain had sent to pacify the Soudan, was killed. The Mahdi died at Omdurman on 22d June 1885. The Khalifa Abdulla succeeded him, but never wielded his power, and his influence was destroyed by the British expedition to Dongola in 1896 and the disastrous defeats inflicted on him by the Sirdar Kitchener (afterwards Lord Kitchener) at the Atbara in April 1898, and especially at Omdurman on 2d September 1898. The Mahdi's tomb in Omdurman was destroyed, the Egyptian flag was hoisted at Khartoum, and, after Fashoda, the whole Nile Valley came under British influence.

For the rebellion, the defeat of Hicks Pasha, and the fall of Khartoum, see EGYPT (Vol. IV, p. 243), GORDON, SOUDAN. See also Darmesteter, *The Mahdi Past and Present* (Eng. trans. 1885); Wingate, *Mahdism and the Egyptian Soudan* (1891); Ohrwalder, *Ten Years' Captivity at the Mahdi's Camp* (1892); Slatin Pasha, *Fire and Sword in the Soudan* (trans. by Wingate, 1896); Bennett Barboz, *Sirdar and Khalifa* (1898); G. W. Stevens, *With Kitchener to Khartoum* (1898).

Mahé, the only French settlement on the west coast of India, is in Malabar district, 35 miles NNW. of Calicut. Area, 3½ sq. m.; pop. 8280.

Mahi Kantha Agency, a group of fifty two native states in Bombay. Of the total area of 11,019 sq. m. nearly one-half belongs to the state of Ekar. Pop. 581,868, including 30,000 Bhils.

Mahmud. See TURKEY, GRAZNI.

Mahogany, the wood of the *Swietenia mahogoni*, a tree from 80 to 100 feet high, belonging to the natural order Cedrelaceæ, a native of the West Indies and of South America. The tree attains an immense size, and its timber is generally found throughout in the largest trees. It is most abundant on the coast of Honduras and around Campeachy Bay. St Domingo and Cuba yield a finer quality than that obtained from the mainland, which is frequently called Bay Wood, to distinguish it from Cuba mahogany, usually called Spanish. The wood varies much in value, according to the colour and beauty of curl; single logs have occasionally realised as much as £1000, for cutting into veneers, in which state it is very generally used, its great weight and value unfitting it for being always employed solid. The first notice we have of mahogany is in connection with the repairing of some of Sir Walter Raleigh's ships in Trinidad in 1597; but the wood does not appear to have been carried to Britain till about the end of the 17th century, when it was brought from the West Indies as ballast by a Captain Gibbons. The captain's brother wished to use the timber for his house then in course of erection, but the workmen declined to work it owing to its extreme hardness. A portion was, however, given to one Wollaston, a cabinet-maker, of which to make a candle-box for Dr Gibbons. When finished, the box exhibited such rare beauty as to create much interest in society; and bureaux made by Wollaston soon established the reputation of mahogany for cabinet-work. The annual imports into Britain are about 40,000 tons, with a value of £350,000. The bark has a faint aromatic smell and a very astringent bitter taste, and in the countries where the tree grows is used as a medicine. As *Mahogany Bark*, or *Amaranth Bark*, it has been employed as a substitute for Peruvian Bark.—East India Mahogany is the timber of the *Rahuna Tree* (*Soyimida febrifuga*), and African Mahogany of the *Khaya Senegalensis*, both of the order Cedrelaceæ.

Mahomet. See MOHAMMED.

Mahon. See STANHOPE, PORT MAHON.

Mahony, FRANCIS, better known by his famous pen-name, 'Father Prout,' was born at Cork in 1804, and educated for the priesthood at a Jesuit college in Paris, and subsequently in Rome, where he remained for two years and received ordination. He taught in a Jesuit college, was chaplain to a Cork hospital, but ceased to exercise the clerical calling about 1834, and joined the staff of *Fraser's Magazine*, his contributions to which were republished under the title of *Reliques of Father Prout* in 1836. He contributed also to *Bentley's Magazine* from 1837. For two years he acted as Roman correspondent to the *Daily News*, and his letters were collected and published in 1847 as *Facts and Figures from Italy by Don Jeremy Sacumarolo, Benedictine Monk*. During the last years of his life he lived in Paris, and was correspondent to the *Globe* newspaper till his death, May 18, 1866. Mahony possessed great scholarship and a rich fund of genial humour. Amid all the convivialities of the 'Fraserians,' he preserved his reverence for religion without allowing it to cloud the brightness of his wit. 'His fun is essentially Irish—fanciful, playful, odd, irregular, and more grotesque than northern fun. In one of his own phrases, he is an Irish potato, seasoned with Attic salt, and oblivion has no poppy for the exquisite pathos of verse like 'The Bells of Shandon' and 'The Lady of Lee.' A volume of *Final Reliques of Father Prout* was published in 1876 by Mr Blanchard Jerrold; and there is an edition of his works, with a Life, by Charles Kent (1881).

Mahound, a corrupt early western spelling of MOHAMMED (q. v.).

Mahrattas (*Marāthas*, or *Marhatas*), a people of mixed origin, Hindus in religion and caste ordinances, inhabiting Western and Central India, from the Satpura Mountains to Nagpur. The Mahratta Brahmans claim to be Rajputs; the bulk of the people are Sudras, and probably of aboriginal blood mainly. They are first mentioned in history about the middle of the 17th century, when they possessed a narrow strip of territory on the west side of the peninsula. The founder of the Mahratta power was Sivaji, a freebooter or adventurer, whose father, Shahji Bhonsla, was an officer in the service of the last king of Bijapur. By policy or by force, he eventually succeeded in compelling the several independent Hindu chiefs to acknowledge him as their leader, and with the large army then at his command overran and subdued a large portion of the emperor of Delhi's territory. His son and (1680) successor, Sambhaji, after vigorously following out his father's policy, was taken prisoner by Aurungzebe in 1689, and put to death. His son, a prisoner, resigned his rule to his minister, with the title of *Peshwā*; the descendants of Sivaji henceforward reigned over but did not govern Sattara (see INDIA, p. 118). Under the fourth hereditary Peshwā there were five Mahratta states, more or less powerful and independent: that of the Peshwā at Poona; that of the Bhonslas at Nagpur; Gwalior, ruled by Sindhia; Indore, by Holkar; and Baroda, by the Guicowar. The invasion of the Delhi empire by Nadir Shah afforded these wild and warlike mountaineers an opportunity, of which they eagerly availed themselves, to wrest additional territory from the feeble grasp of the Mogul emperor. From this time they discharged the office of arbiters in the quarrels between the emperor, his vizier, and his rebellious subjects; but the frightful defeat (January 1761) they sustained at the hands of Ahmed Shah Durāni, the ruler of Afghanistan, on the field of Panipat, where they lost 50,000 men, and all their chiefs except Holkar, weakened their power for a time. They still, however, continued to be the hired mercenaries of the Delhi emperor, till the growing influence of the British compelled them to look to their own safety. After many long and bloody contests with the British and their allies (1780, 1803, 1817-18), in which sometimes the whole, but more frequently a portion of the Mahrattas joined, they were one by one, with the exception of Sindhia, reduced to a state of dependence. This last-mentioned chief, having raised a powerful army, officered by Frenchmen, and disciplined after the European method, continued the contest for a number of years, till his power was finally broken in 1843. The dignity of Peshwā was abolished in 1818, and his territories were occupied by the British. The Mahrattas are almost all now in British or Mohammedan states; in the states called Mahratta states (Gwalior, Indore, Baroda; see INDIA, p. 110) only the prince and his relatives are Mahrattas, the people being of other stocks. See Grant-Duff's *History of the Marāthas* (1826).

Mahwa-tree. See BUTTER-TREE.

Mai, ANGELO, CARDINAL, a distinguished Italian scholar, was born in the village of Schilpario, in Lombardy, March 7, 1782. He was educated and lived till 1808 in Jesuit establishments, next was a secular priest at Milan, and became custodian of the Ambrosian Library there. Here he devoted himself to palaeography, and during the next six years discovered a series of long-lost works, many from palimpsests. Among these were fragments of some of Cicero's *Orations*; of *Plantus*, especially of the *Fidularia*, a lost play; of *Letters*

of Fronto, the preceptor of Marcus Aurelius; of Isæus, Themistius, Dionysius of Halicarnassus, Philo, Porphyrios, and the *Chronicon* of Eusebins. All these, however, were eclipsed by his well-known edition and restoration of the *De Republica* of Cicero (1822). Meanwhile Mai had been invited to Rome by Pius VII., and named to the charge of the Vatican Library. He at once turned his attention to the unedited MSS. of the Vatican, and undertook the task of publishing those among them which had been neglected by earlier editors; and although appointed in 1833 to the onerous office of secretary of the Propaganda, and in 1838 to the cardinalate itself, he found time to superintend a series of publications almost unexampled in extent and importance in modern times. His first series was in ten quarto vols., entitled *Scriptorum Veterum Nova Collectio, e Vaticanis Codicibus edita* (1825-38). It consists, like the great collections of Mabillon, Montfaucon, D'Achéry, and others, of miscellaneous unpublished Greek and Latin works, partly sacred, partly profane, comprising an entire volume of palimpsest fragments of the Greek historians, Polybius, Diodorus, Dion, Dionysius, and others. The succeeding collections, *Classicorum Auctorum Collectio, e Vaticanis Codicibus edita* (10 vols. 1828-38), *Spicilegium Romanum* (10 vols. 1839-44), and *Patrum Nova Bibliotheca* (6 vols. 1845-53), are all on the same plan, and all equally replete with new and interesting materials. For many years Cardinal Mai was engaged in preparing an edition of the celebrated *Codex Vaticanus*, but long postponed its publication with the intention of preparing preliminary dissertations. But death overtook him unexpectedly near Albano, September 9, 1854; and the edition was ultimately published without these (5 vols. 1858). This work was far from being entirely satisfactory, and has since been superseded by the edition of Verecclione and Cozza (1868). Cardinal Mai's library was bequeathed, at half its estimated value, to the Vatican, for the good of the poor of his native village.

Maiden. THE. See GUILLOTINE.

Maidenhair (*Adiantum Capillus-Veneris*), a small, delicate, and graceful fern, with bipinnate fronds, alternate obovate and wedge-shaped membranaceous pinnules on capillary stalks, and marginal *sori* hidden beneath oblong *indusia*; growing

Maidenhair:
a, *Adiantum Capillus-Veneris*; b, *Adiantum cuneatum*.

on moist rocks and old walls, especially near the sea; rare in Britain, but very abundant in the south of Europe, where it covers the inside of wells and the basins of fountains (as at Vancluse) with a tapestry of the most delicate green. Another

species of the same genus, *A. polatum*, a native of North America, with *polate* leaves, has a sweet, fragrant root-stock, of which Capillaire (q.v.) is made. It is supposed that the name maidenhair originated in the use of a mucilage made from this fern by women for stiffening their hair. This name is sometimes applied also to some species of spleenwort (*Asplenium*), as *A. adiantum nigrum* and *A. trichomanes*. It is also applied to the *Adiantum* family generally, of which there are many species and varieties. The most common of all and best known popularly is *A. cucullatum*, a Brazilian species, which is much cultivated by florists.

Maidenhead, a municipal borough and market-town of Berkshire, with a population (1891) of 10,607, is situated amidst beautiful scenery 13 miles E. by N. of Reading, and 26 W. of London, and on the right bank of the Thames, over which are two bridges, one of stone, built 1772 at a cost of £20,000, and the other of brick, on the Great Western Railway (described Vol. II. p. 439). With the exception of a recreation-ground of 12 acres, opened 1890, there is little of interest in the town, which in 1399 was the scene of an engagement between the rival forces of Richard II. and Henry IV., and in 1647, at the Greyhound Inn, of the interview of Charles I. with his children. On the opposite, or Bucks, side of the river is Taplow (pop. 1063), whose wooded slopes are crowned by 'Cliveden's proud alcove.' The present house dates only from 1851; two previous mansions—in the earlier of which Thomson, whilst on a visit to the father of George III., probably composed 'Rule Britannia'—having been destroyed by fire in 1795 and 1849.

Maidment, JAMES, Scottish antiquarian and literary collector, was born in London in 1794, being descended on his mother's side from Jan van Olden Barneveldt, the Dutch patriot. He was educated at the High School and university of Edinburgh, and was called to the Scottish bar in 1817. He became almost the greatest authority in Scotland on genealogical law cases, and took a prominent part in the Mar peerage case and others. He died in Edinburgh, 24th October 1879. The passion of his life was the collection of literary rarities, often not of a very choice character. His most ambitious publication was *The Dramatists of the Restoration* (14 vols. 1872-75), edited with W. H. Logan; besides this he edited *A North Country Garland, a Collection of Ancient Ballads* (1824; new ed. 1884); *Scottish Pasquils or Lampoons* (1827-28; new ed. 1868); *New Book of Old Ballads* (1844; new ed. 1885); *Scottish Ballads and Songs* (1859 and 1868); *Packet of Pestilent Pasquils* (1869); an *Account of the Bonnytown Club*; and several historical, antiquarian, and genealogical works.

Maids of Honour. See HOUSEHOLD.

Maidstone, the county and assize town of Kent, is seated on the right bank of the Medway, 34 miles ESE. of London by road (41½ by rail), and 25 W. of Canterbury. At its west entrance, overlooking the river, which is spanned by a three-arch stone bridge, built 1877-79 at a cost of £55,000, stand the picturesque remains of All Saints' College (of which William Groeyn was once master), originally established in 1260 as a hospital for pilgrims travelling to Canterbury, and, like all other institutions of the same kind, suppressed in the reign of Edward VI. Close by is All-Saints' Church, a fine example of the Perpendicular style, built towards the end of the 14th century, and restored 1860; its interior is 227 feet long, and contains many interesting monuments and brasses, and a fine organ (1880). From the tower, 78 feet high, formerly rose a spire of 94 feet, which was destroyed by lightning in 1731. To the north

of this, the principal of Maidstone's ten churches, are schools of art and music, occupying a former palace of the archbishops of Canterbury; and other features of interest comprise a grammar-school, at which Sir Egerton Brydges was educated, founded 1549, and rebuilt on a new site, 1871; museum and public library, established 1858 in Chillington House, where, too, are the headquarters of the Kent Archaeological Society; town-hall (1764); county gaol (1812-19), built of Kentish rag-stone, obtained from adjacent quarries; hospital (1832-80); cavalry and militia barracks; corn exchange (1835); ophthalmic hospital (1851-69); and a public park on Penenden Heath to the NE. of the town, where formerly were held the county elections and other great meetings. Lining the river-banks are numerous paper-mills and a large oil-mill, whilst several breweries are in operation, and an important traffic is carried on in hops. Maidstone returned two members to parliament till 1885, when the number was reduced to one, and was first incorporated as a municipal borough in 1548; it gives the inferior title of viscount to the Earl of Winchelsea. Pop. (1801) 8027; (1831) 15,387; (1881) 29,623; (1891) 32,145. The history of the town is bound up with that of Kent (q.v.), the only special incidents identified with Maidstone being its storming in 1648 by Fairfax, when garrisoned by a royalist force, which only surrendered after a desperate resistance. Woollett the engraver, Hazlitt the essayist, and Newman Hall were natives; and Sir Thomas Wyatt the poet, and his son, the rebel, lived at Allington Castle, 2 miles distant. There was a terrible visitation of typhoid fever in September and October 1897, due—as was proved—to defective and polluted water-supply.

See works by J. M. Russell (1881) and Rev. J. Cave-Browne (1889).

Maigre (*Sciana aquila*), a fish of the acanthopteros family Scenidae, common in the Mediterranean but rare on British shores. It is usually 3 feet, sometimes 6 feet long. It resembles a large bass and is excellent for the table.

Mail. See ARMOUR, POST-OFFICE.

Maidun, the hero of an ancient Irish romance, first translated by Dr Joyce in his *Ancient Celtic Romances* (1879), and supposed by him to be the product of a rich and vivid imagination, working freely on a real voyage made in the beginning of the 8th century. The story forms one of the four extant *Laurina* or voluntary sea-expeditions, of which the most famous is the 6th-century voyage of St Brendan; and it has been made familiar to all readers in the splendid verse of Tennyson. Maidun was the son of Allil Ocar Aga, of the tribe of Owenaght of Ninnis, in the north-west of County Clare, and before his birth his father was killed by a band of sea-robbers. He grew up handsome and accomplished, but had scarce reached manhood before he set sail in a triple-hide curragh with a crew of sixty men to find his father's murderer. For three years and seven months he voyaged on the western sea, seeing marvels such as no eyes had seen before. He visited islands of monstrous ants, of blood-thirsty quadrupeds, of red-hot animals, and of those which turn themselves round inside their skins, as well as the isles of the blest, of laughing, of weeping, of intoxicating wine-fruits, of the mystic lake, of the burning river, of the crystal bridge, and the four precious walls. Further wonders were the demon horse-race, the palace of solitude, the miller of hell, speaking birds, a water-arch in the air, and the silver pillar of the sea. At length Maidun found the murderer of his father, but forgave him his wrong because of the great mercy of God in having delivered himself from so many dangers.

Maimana, an Uzbek state tributary to Afghanistan, and virtually a province of that country, situated on the northern frontier next Russian Turkestan; it has an area of about 4750 sq. m., and a pop. of 100,000, mostly warlike Uzbeks and Tajiks. The country is mountainous. The capital is Maimana, SW. of Balkh, 25 miles from the frontier. Previous to the seizure of the place by the Afghans, in 1874, it was a considerable town, but is now a village of 2500 inhabitants, who trade in horses, carpets, and dried fruits.

Maimansingh, a district of the Bengal division of Dacca, the capital of which is Nasirabad.

Maimatchin, a Chinese trading-town on the northern boundary of Mongolia, opposite Kiachta (q.v.), from which it is separated by a narrow strip of neutral territory. Pop. 3000.

Maimbourg, LOUIS (1610-86), a French Jesuit church historian, was expelled in 1685 from the order for his defence of Gallicanism, but became a pensioner of Louis XIV. He wrote histories of Wyclitism, Lutheranism, Calvinism, and of the prerogatives of the Church of Rome.

Maimon, SOLOMON, philosopher, was born of Jewish parents about 1754 in a village on the Niemen, near Mir, in the west of what is now the Russian government of Minsk. His mind was trained in the study of the Talmud, and he qualified for a rabbi. But possessing a burning desire for truth, and having become acquainted with the philosophy of Maimonides, he made his way to Berlin, and studied modern philosophy, languages, and some science. A child of nature, with the strong, subtle intellect of the born philosopher; shy, eccentric, dirty, and unmethodical; improvident, intemperate, and wholly irregular in his habits, Maimon led a vagabond life, battling against chronic poverty, and always dependent upon his friends for the bare necessities of existence. Besides cultivating his own mind, and teaching a little, he never did any work, except write some philosophical treatises and literary hack-work, done anywhere and at any time, mostly in poor taverns. Yet this ragged philosopher had Mendelssohn, the philosopher, among his friends, was admired by Kant, and attracted the attention of Goethe. This good fortune he owed to his *Versuch einer Transcendentalphilosophie* (1790), an eclectic system, in which he attempted to supplement Kant's by truths gleaned for the most part from Spinoza, Leibnitz, Hume, Locke, and others. He died in the house of Count Kalkreuth, his last patron, at Siegersdorf, in Lower Silesia, on 22d November 1800.

See his very interesting *Autobiography* (1792; Eng. trans. by J. Clark Murray, 1888); S. J. Wolf's *Maimoniana* (1813); and the Life by Witte (Berlin, 1876).

Maimonides, the name by which Christians generally know the great Jewish teacher, Rabbi Moses ben Maimon, who from the initials of these words is called by the Jews RAMBAM. He was born at Cordova, March 30, 1135, and received his first instruction from his father. Under the most distinguished Arabic masters of the time he then devoted himself to the study of Greek (Aristotelian) philosophy, the science of medicine, and theology. Under the Almohades his family had to conform outwardly to Mohammedanism, and ultimately emigrated to Egypt, and Maimonides became physician to the reigning sultan, Saladin. At Cairo he died December 13, 1204. His importance for the religion and science of Judaism, and his influence upon their development, are so gigantic that he has not unjustly been placed second to Moses, the great lawgiver, himself. He first of all brought order into those almost boundless receptacles of tradition, and the discussions and

decisions to which they had given rise, which, without the remotest attempt at system or method, lie scattered up and down the works of Haggada and Halacha—Midrash, Mishnah, Talmuds. Imbued with the spirit of lucid Greek speculation, and the logical thought of the Arabic Peripatetics, Maimonides, aided by an enormous knowledge, became the founder of rational Scripture exegesis. The Bible, and all its written as well as implied precepts, he endeavoured to explain by the light of reason, with which, as the highest divine gift in man, nothing really divine could stand in real contradiction. The miracles themselves, though not always traceable to their immediate cause, yet cannot be wrought in opposition to the physical and everlasting laws in nature. Where literal interpretation seems to jar upon the feelings of reverential awe towards the Highest Being, there an allegorical explanation is to be adopted unhesitatingly. As to the philosophical system of Maimonides, we can barely hint at its close similarity with that of Averroes. Maimonides fully allows the freedom of will, and holds that providence reigns in a broad manner over humanity; but he utterly denies the working of providence in the single event that befalls the individual, who, subject above all to the great physical laws, must learn to understand and obey them. The soul, and the soul only, is immortal, and the reward of virtue consists in its unbodily bliss in a world to come; while the punishment of vice is the 'less of the soul.'

Maimonides' first work of paramount importance is his Arabic commentary of the Mishnah, which forms an extensive historical introduction to *Tradition*, or the Oral Law; and this introduction, translated into Hebrew, has now for more than five hundred years been deemed so essential a part of the Talmud itself that no edition of the latter is considered complete without it. This was followed by the *Safer Hamitzvot*, or Book of the Precepts, in Arabic, which contains an enumeration of the 613 traditional laws of the Halacha; the text was first edited by M. Bloch (Paris, 1888). This book is to be considered chiefly as an introduction to the gigantic work which followed in 1180, under the title of *Mishne Torah* ('Second Law'), or *Yad Chasakoth* ('Strong Hand'), a Hebrew compendium in 982 chapters, embracing the entire Halacha. The summit of his renown, however, Maimonides reached in his grand Arabic work, *Delaloth Al-Ha'irin* (translated into Hebrew by R. Tibbon as *Morah Nebuchim*, 'Guide of the Erring'), a philosophical exegesis, which, while on the one hand it has contributed more than any other work to the progress of rational development in Judaism, has on the other hand also become the arena for a long and bitter fight between orthodoxy and science, between the spiritualistic Maimonidian and the 'literal Talmudistic' schools. Ultimately the antagonistic parties came to a reconciliation, and Maimonides' name became the pride and glory of the race; and as early as the 13th century, already portions of his works, chiefly the *Morah* ('Doctor Perplexorum'), became, in Latin versions, the text-books even of European universities. See *The Guide of the Perplexed of Maimonides*, translated and annotated by Friedlander (3 vols. 1886); and his Life of Maimonides.

Main, a river of Germany, the largest affluent the Rhine receives from the right, is formed by the union of two branches, the White and the Red Main, 4 miles below Kulmbach, in north-east Bavaria. The White Main rises in the Fichtelgebirge, 2900 feet above sea-level; the Red Main, a few miles S. of Bayreuth. The river flows westward by huge zigzags past Bamberg, Schweinfurt, Würzburg, Aschaffenburg, Hanau, Offenbach, and

Frankfort, and mingles its yellow waters with the green current of the Rhine opposite Mainz, after a total course of 307 miles, the last 205 of which are navigable. The chief affluents are, on the right, the Saale, and on the left, the Regnitz. The Main flows through a beautiful country, the hill-slopes generally covered with vineyards and surmounted by castles. Its waters communicate with those of the Danube by means of the Ludwigs-Kanal and the Altmühl. The Main divides politically North Germany from South Germany.

Maine, an old province of France, having Normandy on the north, Brittany on the west, and Anjou on the south, corresponded to the modern departments of Sarthe and Mayenne. Its chief town was Le Mans.

Maine, the north-easternmost state of the American Union, is bounded N. by the Canadian provinces of Quebec and New Brunswick, E. by New Brunswick, S. and SE. by the Atlantic Ocean (Gulf of Maine), W. by New Hampshire, and NW. by the province of Quebec. Area, 33,040 sq. m., of which one-tenth is water, there being many large and fine lakes (Moosehead, Chesuncook, Sebasticook, Grand, Sebago, &c.) and important rivers (Penobscot, Kennebec, Androscoggin, Saco, St Croix, Aroostook, and Wallowoosook or St John). It is thus somewhat larger than Ireland. Measured in a direct line the coast extends some 270 English statute miles, but if its sinuosities and the outlying island-shores were measured it is estimated that the whole would be extended to about 2500 miles. When the poet Whittier speaks about 'hundred-harbour'd Maine,' he scarcely exaggerates, for the rocky coast-line, broken by the force of the waves and trenched in former geological times by glaciers, forms almost that number of anchorages, some of them highly important for their commerce, and others serving as harbours of refuge. Towards the south-west the shore is sandy, and there are salt marshes, producing much coarse hay. The surface is uneven, and in the north-central regions and the west it is even mountainous. The scenery at some points (as on Mount Desert Island, on some of the lakes, and in the region near Camden) is very picturesque. The highest mountain is Katahdin (5385 feet). The soil is mostly stony and hard, as in New England generally, but some sections are very fertile—the Aroostook region in the north-east for the most part exceedingly so. The northern portion of the state is covered in great part with a dense forest, and its population is very sparse.

The geological features are complex, but a great proportion of the strata shows metamorphic traces. The surface is everywhere scored with prehistoric glacier and drift ice. Granite is very extensively quarried, and presents many handsome varieties. Excellent lime is largely produced. Traces of coal are found (as at Georgetown and Bucksport), and there are local beds of valuable graphite. The state is rich in rare minerals. Many silver-mines have been opened, and a few are still operated in a small way; but the ores (sulphide of silver accompanying galena, &c.) are often rebellious and expensive to work. Vast beds of copper (bornite, chalcocite, chalcopyrite) exist, some of them quite rich. Felspar, flag-stone, limonite, mica, yellow-ochre, glass sand, slate, the latter in vast quantities and of high grade, lead ores, talc, tripoli, and manganese are all wrought to a greater or less extent. Tourmaline is obtained as a precious stone, for jewellers' use; and lepidolite, a mineral rich in the rare metal cesium, is locally found in considerable abundance. Mineral waters are shipped in large quantities.

The cool climate and the opportunities for fishing and shooting make this state a favourite region for summer resort. The winter climate is severe for the latitude; the winters are long and the snows deep. Ice, which is harvested especially on the Kennebec, is an important commodity for export. The leading crops are hay, potatoes, apples (of excellent quality), and the ordinary grains and small fruits. The sweet varieties of maize (sugar-corn) are extensively cultivated, and are sold largely in tins and glass for winter consumption; this is a prominent industry in some sections. The rainfall is copious. The rivers of Maine afford an enormous water-power, only a relatively small part of which is at present utilised. Forest products (timber, tan-bark, &c.) are extensively cut. Navigation is favoured by the numerous inlets and the large navigable streams, and railway communication is fairly developed. Timber, building-stone, ice, cattle, wool, and farm products are shipped. Maine has considerable shipbuilding (more than any other state), and the coasting trade is carried on largely. The fishing interests are extensive: mackerel, lobsters, herring, 'sardines' (here mostly small herring), fish-oil, and fish-guano are the staple products of the fisheries. The principal manufacturing industries of the state are the making of cotton and woollen goods, leather, boots and shoes, flour, paper, and foundry products, the sawing and planing of lumber, shipbuilding, the canning of fruit and lobsters, &c.

Maine contains sixteen counties, and returns four members to congress. The chief towns are Portland, the largest city and principal seaport; Bangor, on the navigable river Penobscot; Lewiston, the seat of extensive cotton manufactures; Augusta, the state capital; Bath, noted for its shipbuilding; Auburn, Belfast, Rockland, Biddeford, Saco, Brunswick, Brewer, Eastport, Gardiner, Hallowell, Waterville, &c. Education is general and on the whole progressive. There are colleges of repute at Brunswick, Waterville, Lewiston, and Orono, the last a state institution. The Maine Liquor Law, one of the earliest of the stringent Liquor Laws (q.v.; and see TEMPERANCE), was enacted in 1851. The population is mainly of the English Puritan stock of New England. There is a large element of French-speaking Canadian immigrants, and in the extreme north there is a considerable body of Acadian French who have occupied for nearly 150 years a fertile region on the river St John. Latterly there has been an influx of Irish, Swedish, and German settlers. An old German colony near the coast has become completely Americanised. There are a few Indians left in the state; but the African element is very small indeed. Pop. (1820) 298,335; (1860) 628,279; (1880) 648,936; (1890) 661,086.

History.—The early Dutch settlements did not prove permanent. The English established settlements here as early as 1607, but with no success. The French planted an unsuccessful colony on Neutral Island in 1604, but all their attempts at colonisation on the coast were speedily abandoned. Bristol or Pemaquid was settled in 1630, and had an interesting early history, becoming in 1648 a centre of a new but temporary 'Dual State' subject to the Duke of York, afterwards James II. York, settled probably in 1621, was the capital of a colony under Sir Ferdinando Gorges (q.v.). In 1635 the western part of Maine received the title of the Province of Maine, and from 1651 to 1820 it formed a detached part of Massachusetts, called the district of Maine; Massachusetts in 1677 bought the title to the Gorges colony. Eastern Maine until 1691 formed a part of Acadia or Nova Scotia. Maine became a state in 1820. An angry dispute with Great Britain as to the northern and eastern

boundary was settled in 1842 by a compromise. Latterly the depletion of the pine-forests and a large emigration to the West have checked the material progress of Maine, but its healthful climate and its natural resources ensure to the state a prosperous future. See G. J. Varney, *Brief History of Maine* (Portland, 1889).

Maine. SIR HENRY JAMES SUMNER, was born in 1822, and had his education at Christ's Hospital and Pembroke College, Cambridge, where his career was unusually brilliant. He carried off the Craven scholarship and other university prizes, and graduated in 1844 as senior classic and Chancellor's classical medallist, as well as a senior optime in mathematics. Soon after he was elected fellow and tutor of Trinity Hall, and in 1847, at the age of twenty-five, was appointed regius professor of Civil Law, which office he vacated in 1854 to become Reader on Jurisprudence at the Middle Temple. He was called to the bar in 1850, and went to India in 1862 as Law Member of the Council in India—an office held by Macaulay, and in which he himself was succeeded in December 1869 by Sir James Fitzjames Stephen. In 1870 he was appointed to fill the new chair of Comparative Jurisprudence at Oxford, and next year to a seat in the Council of the Secretary of State for India, on which occasion he was created K.C.S.I. At the close of 1877 he was elected Master of Trinity Hall at Cambridge, and in 1887 also Whewell professor of International Law. But his health was already broken, and on February 3, 1888, he died of apoplexy at Cannes. Maine gave some wise reforms to Indian law, but it is by his work on the origin and growth of legal and social institutions that his name will be best remembered. His books were *Ancient Law* (1861), one of the most important and influential works of its time; *Village Communities in the East and West* (1871); *The Early History of Institutions* (1875); *Early Law and Custom* (1883); and *Popular Government* (1885). One fundamental idea of Sir Henry Maine's was to make paternal or patriarchal power the germ from which society developed. This view was strongly controverted by M'Lennan, Morgan, and Spencer; but Maine's answer was marked by equal learning and far greater lucidity and grace of exposition. See the Memoir by Sir M. E. Grant Duff (1892).

Maine-et-Loire, a department of France, formed out of the old province of Anjou, and watered by the rivers whose names it bears, is divided into the arrondissements of Angers, Beaugé, Cholet, Saumur, and Segré. Area, 2749 sq. m.; pop. (1872) 518,471; (1886) 527,680; (1891) 513,815. The soil is fertile, and produces excellent corn and wine, with hemp, linseed, fruit, and green crops. Slate quarries and coal-mines are worked; and there are mills for cotton, woollen, and linen manufactures. Capital, Angers.

Mainotes, the inhabitants of the mountainous peninsula of Maina, that lies between the gulfs of Koron and Marathonisi in the extreme south of Greece. They claim to be the descendants of the ancient Spartans, number close upon 50,000, and are a well-built race, industrious and hospitable, but revengeful, great lovers of liberty, and formerly implacable foes of the Turks. They took a prominent part in the war for the liberation of Greece. In 1676 about 1000 Mainotes emigrated to Corsica; their descendants still survive at Cargèse in that island. Amongst the emigrants were some bearing the name of Kalomeros, which in Italian is translated Buonaparte. Hence the people of Maina believe that the great Napoleon was of Greek origin. The emigrants were settled at Ajaccio from 1729 down to 1769, in which year Napoleon was born there.

Mainpuri, capital of a district in the North-western Provinces of India, 75 miles E. of Agra. Pop. (1881) 20,236.

Maintenance is a law-term commonly used to denote an illegal succouring of a person, as by lending money to a stranger in carrying on law-suits. Contracts are sometimes held to be illegal on this ground. At Guildford, in July 1889, a man got six months' imprisonment with a fine of £200 for maintenance and Barratry (q.v.).

Maintenance, CAP OF, sometimes called *Cap of Dignity*, a cap of crimson velvet lined with ermine, with two points turned to the back, originally only worn by dukes, but afterwards assigned to various families of distinction. Those families who are entitled to a cap of maintenance place their crests on it instead of on a wreath. See HERALDRY, p. 667.

Cap of Maintenance.

Maintenon, FRANÇOISE D'AUBIGNÉ, MARQUISE DE, famous for her connection with Louis XIV., was the daughter of Constant d'Aubigné, the worthless son of the famous Huguenot, Théodore Agrippa d'Aubigné, and was born in the prison at Niort, November 27, 1635. When four years old she was carried to Martinique in the West Indies, whence she returned after her father's death in 1645 to France. Her conversion to the Roman Catholic religion was effected not without difficulty, and on her mother's death she found herself at fifteen reduced to absolute penury. Soon after this she became acquainted with the kind-hearted poet Scarron, who offered either to marry her himself or to pay the money required for her entrance into a nunnery. Although Scarron was lame and deformed, she chose to marry him, and for nine years lived contentedly in the midst of the intellectual society which frequented the house of the poet. On his death (1660) she was again reduced to great poverty; but Anne of Austria continued and increased her husband's pension. On her death (1666) it was discontinued, and she was about to go as a governess to Portugal, when Madame de Montespan obtained for her the continuance of her pension. In 1669 she was given the charge of the king's two sons by Madame de Montespan, and in this capacity displayed a patient tenderness and sleepless care that no mother could have surpassed. By 1674 she had made sufficient money to buy the estate of Maintenon, and four years later had it made a marquise by the king. She had now completely established her ascendancy over the heart of Louis, who made her in 1680 second lady-in-waiting to the dauphiness. The queen died in 1683, and Madame de Maintenon, who had become first lady-in-waiting to the dauphiness the year before, married the king privately in the winter of 1685. Her morals were severe, for her heart was never other than cold, and she knew that the best cards for her game were propriety, orthodoxy, and the church. Her moral influence over the court would have been greater had she filled a more recognised position. Her political influence was supreme in all but the more important questions of policy, and she lavished her patronage upon persons devoted to herself. She was a liberal patroness of letters, and, while she had a high reputation for orthodoxy, had too much humanity to approve of the detestable *dragonnades*. Yet in the midst of splendour, and in the possession of great power, she was unhappy, and she often turned for solace to the home for poor girls of good family she had established at

St Cyr, and for which she laboured with the most ceaseless care. Hither she retired when the king died in 1715, and here she died, April 15, 1719. Her pretended *Memoires* (6 vols. 1755) are spurious, but her delightful and admirable *Lettres* (9 vols. 1756) are genuine. By far the best editions are by T. Lavalée (1854-56) and M. Gellroy (2 vols. 1887).

See the books by Madame Suard (1810), Lafont d'Aussonne (1814), and the Duc de Noailles (1848-58); also Théophile Lavalée's *Histoire de St Cyr*, and its review in vol. viii. of Sainte-Beuve's *Causeries du Lundi*; the studies by Cœter Morison (1885) and Emily Bowles (1888); vol. ix. of Scherer's *Études sur la Litt. Cont.*, and Dollinger in *Althainische Zeitsung* (1886).

Mainz (*Mayence*), an imperial German fortress of the first rank, and the seat of a Roman Catholic bishop, in the grand-duchy of Hesse, is situated on the left bank of the Rhine, opposite the junction of the Main, 22 miles WSW. of Frankfurt. The Rhine is here crossed by a stone bridge (superseding in 1885 the former pontoon bridge) to the village of Kastel, included in the fortifications, and by an iron railway bridge, 140 yards long, to the port of Gustavsberg, at the mouth of the Main. Pop. (1875) 56,421; (1890) 72,059, of whom two-thirds are Roman Catholics; in the 14th century it is said to have reached 90,000. Mainz is one of the most ancient cities in Germany; but its oldest part, known as *Kastel*, has been rebuilt in a modern style since its almost total destruction in 1857 by the explosion of a powder-magazine; while a handsome new quarter has sprung up on the north, in the space afforded by the advancing of the fortifications in 1874. The cathedral, originally built in 978-1009, was thrice destroyed by fire, and dates in its present form from the 13-14th century. In 1870-78 it was thoroughly restored, and the present central Romanesque tower, 270 feet high, built. It has five lesser towers, fourteen altars, and nine minor chapels, and is adorned in the interior with frescoes and numerous monuments. Besides various modern public buildings, the city contains the palace of the grand-duke, originally a lodge of the Teutonic Order, dating from the beginning of the 18th century, an arsenal of 1736, and the large red-sandstone electoral palace, in which are deposited various public collections, including a Bibrary of 150,000 vols., and the valuable Romano-German Museum, an antiquarian and historical collection unequalled elsewhere in Europe. Mainz is an important centre of the Rhine trade with Holland and Belgium, and also carries on a very large transit trade by railway, as well as an active manufacturing industry. Elaborate new harbour-works, including docks and storehouses, were opened in 1887 at a cost of £250,000; while the Rhine is skirted by a broad quay, four miles long. Grain, wine, timber, books, music, and the manufactures of the town are the chief articles of trade. Furniture, leather goods, machinery, musical instruments, chemicals, gold and silver ware, hats, soap, &c., are among the manufactures; and brewing, printing, and market-gardening in the environs are also important industries. The history of Mainz connects it with Rome from the year 13 B.C., when Drusus built on its site the important fort of *Moguntiacum* or *Moguntiana*. Among the numerous Roman remains the most remarkable are the *Euplstein*, a column supposed to mark the tomb of Drusus, and the remains of an aqueduct 3½ miles long. The real importance of the town dates, however, from the Frankish emperors. In the 13th century Mainz was the head of the confederacy of the Rhenish cities, but in 1462 it was added to the domains of the archbishops of Mainz, the premier spiritual electors of the empire. The city was several times in the possession of France, notably

in 1801-14. After the Congress of Vienna it was assigned in 1816 to Hesse-Darmstadt, on condition that it was to constitute a federal stronghold, and it was garrisoned by Prussian and Austrian troops. After 1866 it was held by Prussian troops, until in 1870 it was declared an imperial fortress. Mainz was the birthplace of Gutenberg (q.v.), whose house is still pointed out. See works by Schnab (1844), Bockenheimer (1879), Beck (1882), and Schneider (1886).

Maison Carrée. See NIMES.

Maistre, JOSEPH MARIE, COMTE DE, was born 1st April 1751, at Chambéry, of a noble French family which had settled in Savoy. While Savoy was occupied in 1792 by the French, De Maistre, who was a member of the senate, withdrew from the country; and when the king of Sardinia retreated to the island of Sardinia, he accompanied his court. In 1803 he was sent as ambassador to St Petersburg, and here he remained until 1817, when he was recalled to occupy a place in the home government. Thereafter he lived in Turin till his death, February 25, 1821. De Maistre was an ardent ultramontane, and argued with an incisive force of logic and brilliancy of rhetoric more often associated with the opposite side. He maintained the pope as the source and centre of all earthly authority, and an ordered theocracy as the only protection from social and religious anarchy. He is an unusually strong and steady thinker, and has a remarkable faculty of forcing plain arguments forward to an irresistible conclusion. He is profoundly learned as well as logical, and, in short, is much more easily denounced than answered. His first work was *Considérations sur la France* (1796), an able defence of Legitimist views, and onslaught on the *philosophes* of the 18th century. In St Petersburg he wrote his *Considérations Politiques* (1810), *De l'Église vaticane* (1821-22), *Succées de St Petersburg* (1822). The last is unfinished and desultory, but is pregnant with strong thought and suggestiveness. Here is to be found the panegyric on the hangman as the foundation of social order. Other works are his *Éssai de la Philosophie de Bacon* (1836) and *Lettres et Opuscules* (1851). See Life by Glaser (Ber. 1865), by Margerie (Par. 1886); Sainte-Beuve's *Portraits Cont.* (vol. iii.); John Morley's *Critical Miscellanies*; Descotes, *Joseph de Maistre avant et pendant la Révolution* (1893-94); and other books by Lesene (1893) and Cogordan (1894).

XAVIER DE MAISTRE, his younger brother, was born at Chambéry in October 1763, and from an early age served in the Sardinian army. He shared his brother's politics, and after the campaign of 1799 followed Suwaroff to Russia. Here he served with distinction, rising to the rank of general, married a Russian lady, and settled down, even after the fall of Napoleon had restored the dynasty of Piedmont. He paid visits to Naples and Paris, where Sainte-Beuve saw him, and died at St Petersburg, 12th June 1852. His name is remembered for a few delightfully fresh and unpretending books, written in perfect French, and showing that rare mastery of the narrative art in the simple fashion for which Sainte-Beuve sets him beside Prosper Mérimée. The best known is the *Voyage autour de ma Chambéry* (1794), a quaint fantasy, giving an account of a temporary confinement to his quarters at Turin, that might have been written by a stainless Sterne. *Le Léproux de la Cité d'Aoste*, a sweet and touching little story, shows the same inspiration and the same originality in the use made of it. Other stories are *Les Prisonniers du Caucase* and *La jeune Sibirienne*. The *Expédition Nautique autour de ma Chambéry* is a less successful continuation of his

earliest book. De Maistre's (*Œuvres*) appeared at Paris in 1825 (new edition, 3 vols. 1881). See Rey's *Xavier de Maistre* (1865).

Maitland, a town of New South Wales, on the Hunter River, 93 miles NNE. of Sydney by rail, and 20 NW. of Newcastle. It is divided by the river into East and West Maitland, which are separate municipalities. The town is the see of a Roman Catholic bishop. In either division are handsome banks, churches, and other public buildings. In West Maitland (much the more populous part) are several mills, coach-building, tobacco, and boot factories. Good coal abounds in the neighbourhood. Pop. of both divisions, 7300.

Maitland, the name of a Scottish family, celebrated in both the literary and political history of their country. The first who acquired distinction was SIR RICHARD MAITLAND of Lethington, son of William Maitland of Lethington and Thirlstane, who fell at Flodden, and of Martha, daughter of George, Lord Seton. He was born in 1496, studied at St Andrews and in France, and on his return to Scotland was successively employed by James V., the Regent Arran, and Mary of Lorraine. About 1551-52 he received the honour of knighthood, became a lord of the Court of Session in 1551 (before which, however, he had the misfortune to lose his sight), and Lord Privy Seal in 1562. He died 20th March 1586, at the age of ninety. Maitland was one of the best men of his time. In an age of violence, fanaticism, and perfidy, he was honourably conspicuous by his moderation, integrity, and anxiety for the establishment of law and order. He merits consideration not only as an eminent and upright lawyer, but as a poet, a poetical antiquary, and a historian. All his own verses were written after his sixtieth year, and show what things he had most deeply at heart. For the most part they consist of lamentations for the distracted state of his native country, the feuds of the nobles, the discontents of the common people, complaints 'against the lang proces in the courts of justice,' and the depredations 'of the border robbers.' Knox, in his *History of the Reformation*, says of him that he was 'ever civile, albeit not persuaded in religion.' A complete edition of Maitland's original poems was first published in 1830 by the Maitland Club (see BOOK-CLUB). Sir Richard's collection of early Scottish poetry was a work undertaken, if not completed, before his blindness attacked him. It consists of two MS. vols., the first containing 176, and the second 96 pieces; they are now preserved in the Pepysian Library, Magdalen College, Cambridge. Maitland's principal historical performance is the *Historie and Cronicle of the Hous and Surname of Setoun*, &c. See Brunton and Haig, *Scotlars of the College of Justice* (1832).

WILLIAM MAITLAND, best known in Scottish history as Secretary Lethington or Leddington, was the eldest son of Sir Richard Maitland of Lethington. The exact date of his birth is unknown, but it must have been between 1525 and 1530. He probably studied at St Andrews, though his name does not occur in any list of the graduates of that university, and he seems also to have spent some time in study on the Continent. Knox, who was not friendly to him, describes him as 'a man of good learning, and of sharp wit and reasoning.' At the outset of his public career he took the side of the party of reform in religion; but all through life he was the politician first and the reformer afterwards. In 1558 he became secretary of state to Mary of Lorraine, the Queen-Regent, and in the following year joined the Lords of the Congregation, who were in arms against her. His ability soon gave him a prominent place

in the councils of his new allies. In August 1560 he acted as speaker in the Convention of Estates, and the same year was sent to the English court to represent the interests of the Protestants. On the arrival of Mary in her kingdom in August 1561, Maitland associated himself with the queen's brother, afterwards the Regent Moray, in opposing what they deemed the extreme proposals of Knox. To Mary he at first made himself one of her most useful servants, and more than once represented her at the court of Elizabeth, where he proved himself a match even for the latter's astute minister Sir William Cecil. His importance in Scottish affairs is proved by the prominent place he holds in Knox's *History of the Reformation*, some of whose most interesting pages are devoted to his discussions with Leithington. By his connivance at the murder of Rizzio (1566) he made Mary his enemy, though he again became her adviser on the return of Moray after his temporary exile. At first, also, Maitland favoured the schemes of Bothwell, and was privy to the murder of Darnley, yet in the rising that took place on Bothwell's marriage with Mary he ostensibly acted with the insurgents. Nevertheless, after the defeat of the queen at Langside and her consequent flight to England, while seeming to act as a friend to the new government, he secretly favoured the exiled queen. He was one of the commissioners who accompanied Moray to present to Elizabeth their indictment against Mary (1568), but all the while he was plotting against his colleagues. On their return to Scotland the formation of a party in favour of Mary was mainly the work of Maitland. In spite of all his endeavours, however, this party was unable to hold its own against the government, supported as it was by English money and arms. Shut up in the castle of Edinburgh, Maitland and Kirkcaldy of Grange held out till 1573, when they were forced to surrender. Maitland, broken in health, died in prison in Leith a few days later, 'some,' says James Melville, 'supposing he took a drink and died, as the auld Romans were wont to do.' From his accomplishments and political adroitness, Maitland was one of the most notable figures of his time in Scotland; but it was his fatal defect as a statesman that, while all parties admired his ability, he gained the confidence of none. Knox regarded him as no sincere supporter of the principles of the Reformation, and Mary, on the other hand, both hated and suspected him. The rumour regarding the mode of his death may have been without foundation; but the rumour itself is a significant commentary on the character and principles of the man. See Buchanan's *Chambloun*, Skelton's *Maitland of Lethington* (2 vols. 1887-88). For John Maitland, Duke of Lauderdale, see LAUDERDALE.

Maiwand, 50 miles NW. of Kandahar, where an English army was defeated by Ayub Khan, 27th July 1880. See AFGHANISTAN.

Maize, or INDIAN CORN, is the produce of *Zea mays*, a species of cereal having monoecious flowers, the features of which are well illustrated in the accompanying cut. The stem, which is filled with a pithy, fibrous structure, is divided at irregular intervals by nodes, and its strength and solidity is increased by a siliceous outside covering. From the lowest, and sometimes also the second and third node, it sends out 'brace' roots, and these help to support the plant, which sometimes grows to 18 feet in height, the minimum being generally 3 feet. The ears—which are developed within the leaf-sheath at the nodes, and consist of a 'cob' with the grains disposed upon it in regular rows of from eight to twenty, and long 'silk' threads attached to each embryo, which usually extend

beyond the closely-folded tip of the mass of imbricated leaves ('husk') that wraps the whole—are from half an inch to 3 inches in diameter, and from 2 to 17 inches in length. The stem is topped by a 'tassel,' producing an abundance of light, dry, loosely-attached pollen. Maize is hardly a less staple article of food to the inhabitants of tropical and subtropical countries than rice, and is rapidly becoming popular in various forms in temperate and colder climates. It is held to be superior in nutriment to barley, buckwheat, and rye. By analysis it gives 77 per cent. of starch; 3 of zein, a principle analogous to gluten; 2.5 of albumen; 1.45 of sugar; .8 of extractive; 1.75 of gum; 1.5 of sulphate and phosphate of lime; 3 of lignin; and 9 of water. It is more generally used in America (North and South) than in the other continents—in the United States the crop is over 2000 million bushels, or about two-thirds of all the grains grown; but in the Mediterranean countries, Germany, &c., it is also highly valued. The green ears of the sweet varieties are boiled and eaten

Maize (*Zea mays*):
a, flower; b, ear.

from the kernel or served in milk. When coarsely ground maize forms the *hominy* of the southern states of America, and finer ground it furnishes the *mush* or porridge of the northern states; while the whole grains with the cuticle covering removed after being loosened by boiling in a weak lye, are the *hulled corn* of the states generally. *Pop-corn* is a variety whose grains can be roasted and turned and shaken smartly over a brisk fire till they swell and burst, turning inside out; in this state they are coated with syrup and pressed into a ball, or the separate grains are simply sprinkled with salt. The deficiency of gluten in the meal of maize renders it ill adapted to bread-making; but *johnny-cakes* made from it are popular along with bacon, &c., and mixed with rye-meal it forms the common brown bread of New England. Large quantities of starch are manufactured from maize, both for laundry purposes and for making puddings, custards, and blanc-mange; and the starch, by treatment with acid, is converted into glucose or grape-sugar (see SUGAR). The canning of green sweet corn is also an important industry in some states. By the Mexicans the small young shoots of thickly-sown crops are served at table like asparagus and as dessert. The stems of the sugar corn when full grown yield by pressure a thin sweet juice, which when fermented gives a pleasant syrup and from five to fifteen per cent. of sugar, fermented a beer called *chicha*, and distilled an excellent spirit resembling brandy. In countries where maize does not ripen well it is sometimes sown to afford food for poultry, or to be mown as green fodder for cattle. Where it is cultivated for its grain the dried leaves are used as winter fodder. The stalks are used for thatch and for fuel, and for making baskets.

The fibres of the culm and leaves afford a durable kind of yarn; and the husks are elastic, and can be applied to the stuffing of chairs, saddles, &c., and to the manufacture of good durable mattresses, which have become a profitable article of trade in Paris and Strasburg. The husks are also much used for packing oranges and lemons, and in South America for making cigarettes; and good paper has been manufactured from them. Hallowed corn-cobs make homely but serviceable pipe-heads for smoking tobacco. There are few plants of which the uses are more various than maize, and few which are of greater importance to man.—Another species of maize, called Chili Maize or Valparaiso Corn (*Z. Curauqua*), is distinguished by its serrated leaves. It is a smaller plant, a native of Chili, and has won a superstitious regard because its grains when roasted split in the form of a cross. Formerly in England maize was known by the name *Turkey wheat*, being then solely an article of trade from the East; but the name Indian corn, which was given it by the early settlers in America, gradually supplanted the earlier name as the supply from that country ousted that of the earlier sources from the British market. In America it is simply called corn. The native country of maize is uncertain. Humboldt and De Candolle are of opinion that it was introduced from the West Indies and the continent of America, but other authorities adduce good grounds for the contention that the plant is indigenous to or at least was known and cultivated in Asia and Africa before the discovery of America. In an ancient Chinese encyclopædia in the royal library at Paris is an excellent representation of the plant; so that while it was undoubtedly first introduced to Europe about the year 1520 by Columbus from America, there are good grounds for the conclusion that it was known and cultivated in the ancient world long before that time.

Majesty, a title of honour now usually bestowed on sovereigns. Among the Romans *majestas* was used to signify the power and dignity of the people, and after the overthrow of the republic became exclusively the attribute of the emperors. The *majestas* of the emperors of Rome was supposed to descend to those of Germany as their successors; but the adoption of the attribute by other European sovereigns is of comparatively late date. Its use began in England in the later part of the reign of Henry VIII., up to which time 'Your Grace' or 'Your Highness' had been the appropriate mode of addressing the sovereign. Henry II. was the first king of France who was styled 'Most Christian and Catholic Majesty,' the king of Spain came to be 'Catholic Majesty,' and of Hungary 'Apostolic Majesty.' All European emperors, kings, and queens are now generally addressed as 'Your Majesty.' The sovereign of the United Kingdom is personally addressed as 'Your Majesty,' and formal letters are addressed to 'The King's (or Queen's) Most Excellent Majesty.'

Majolica (from the Italian name of the island of Majorca, where this ware seems to have been first made), a decorated kind of enamelled pottery made in Italy from the 15th to the 18th century. It attained its greatest development in the duchy of Urbino, which included the four great manufactories of Pesaro, Gubbio, Urbino, and Castel Durante. Majolica is an earthenware usually of a coarse paste, covered with a stanniferous glaze or enamel. It has sometimes been called 'Raffaello ware' from the fact that a number of the paintings upon it were copied from the designs of that famous painter. Majolica is generally considered to be the most beautiful decorated pottery that was ever extensively made, at least during the Christian era.

Some of the finer pieces when they come into the market bring large, almost fabulous, sums of money. See POTTERY.

Major, in the Army, is the lowest rank of field-officer. There are two on the establishment of every infantry battalion in the British army and three on that of each cavalry regiment, one in command of each battery of artillery, about 150 in the engineers—promoted after twenty years' service whether vacancies exist or not—in the Royal Marine Artillery, and 42 in the Royal Marine Light Infantry. Previous to 1872 the majors of artillery and engineers were called first-captains. The duties of majors of infantry in the field, where they are always mounted, are generally to take up points on which the line is dressed and to command, one the supports, and the other the reserve in attack formation. In barracks they assist the commanding officer in all matters of interior economy and discipline. Cavalry majors perform similar duties, except that in the field each commands a squadron. In garrison all regimental majors and captains who for distinguished service have been given brevet rank as majors take their turn as president of district courts-martial and as field-officer of the day, attending guard-mounting, visiting the guards by day and night, taking command of picquets in case of fire, riot, or alarm, &c. The pay of a major ranges from 16s. a day in the infantry of the line to £1, 4s. 5d. in the household cavalry. In the United States army the yearly pay of a major is \$2500.

The word major is used also in conjunction with other military titles, thus: major-general is the lowest rank of General (q.v.); surgeon-major is the rank next above surgeon; a sergeant-major is a staff-sergeant superior to a sergeant; drum-major, trumpet-major, farrier-major, &c. are the old titles of the sergeant-drummers, sergeant-trumpeters, sergeant-farriers, &c. A corporal-major in the household cavalry corresponds to the regimental sergeant-major or senior non-commissioned officer in other corps.

Major, or MAIR, JOHN, was born near North Berwick, Haddingtonshire, about 1470. After receiving the elements of his education in Scotland, he studied at Oxford, Cambridge, and Paris. At Paris he first entered the college of Sainte-Barbe, and took his degree of Master of Arts in 1494. He next entered the college of Montaigu, the great stronghold of scholastic studies in the university of Paris, and in 1505 became Doctor of Theology. While continuing to reside in Montaigu he gave lessons in the scholastic logic and philosophy in the college of Navarre, and in those studies gained a reputation second to that of no teacher in Paris, and therefore in Europe. Besides teaching, Major wrote voluminous commentaries on Peter Lombard, which, though among the famous books of their time, were wholly out of touch with the true intellectual and religious movements of the 16th century. To this period of his life also belongs his combined history of England and Scotland, written in mediæval Latin, but still of real value as a record of facts, and by reason of the independent judgment of its author.

In 1518 Major was regent or teaching in the college of Glasgow, where he had John Knox among his pupils. In 1523 he left Glasgow for St Andrews, where he acted as regent in Arts at the *Pædagogium* of that university till 1525. At St Andrews he had among his students Patrick Hamilton, and likewise George Buchanan, who spoke of him as 'teaching the art of sophistry rather than dialectics.' Leaving St Andrews in 1525 Major again returned to Paris, where he remained till about 1530, admired and honoured by all who still maintained the traditions of the university as opposed to those who were eager

for the introduction of the new lights of the Renaissance. In 1533 he was appointed provost of St Salvador's College, St Andrews, an office which he held till his death in 1550. Of his last years nothing is known; though it is worthy of mention that in 1547 he was present in St Andrews parish church at the first public sermon preached by his former pupil John Knox, then completely identified with the cause of religious reform in Scotland.

Major was the most famous literary Scotsman of his generation, and as the acknowledged champion of mediævalism was assailed by men of such diverse character and aims as Melancthon and Rabelais. It was his misfortune that his life was mainly given to the advocacy of ideas which were already doomed by the new teachings of the revival of learning. Though born after Erasmus, with whom he was a contemporary in Paris, he yet remained dead to those influences of the Renaissance which made Erasmus the life-long foe of Montaigu and the Sorbonne. Nevertheless, by his great reputation in his own day, and by the strong individuality stamped on those of his writings which still have a certain interest, Major claims a far higher place than has yet been accorded him in the literary history of his country. See Mr A. Constable's translation of his *History* issued by the Scottish Historical Society (1892), in which full information is given regarding Major and his works.

Majorea, or MALLORCA, the largest of the Balearic Isles (q.v.), lies about 100 miles from the Spanish coast, and 150 N. of Algiers. It is 60 miles long by 40 broad, and 1310 sq. m. in area. The climate is healthful, the sea-breeze preserving a nearly equal temperature over the whole island. In the north there are mountains reaching 3500 to 5000 feet in height. The hillsides are terraced; olive groves abound everywhere, and almond, orange, fig, and other fruit trees are common. The vine is grown and good wine made. The soil is extraordinarily fertile, and is cultivated with marvellous patience and skill by the inhabitants, 233,650 in number, who manufacture cloth, cotton goods, ropes, silk, soap, shoes, &c., and have a trade to and from Spain of the annual value of £1,410,000. There are railways (total 48 miles) connecting the capital, Palma (q.v.), with Manacor (15,000), the second town of the island (where as well as at Arta there are magnificent caves), and La Puela (5000). Between this town and Alfindia, the port for Minorca and Barcelona, lie the marshes of Albufera (5000 acres), drained by a London company in 1865-71, and now of extraordinary fertility. Raymond Lully was born at Palma; at Valdemosa George Sand resided in 1838 and wrote her *Spardion*; and the beautiful seat of the Austrian Archduke Ludwig Salvator is at Miramar. Large quantities of lusted ware (Majolica, q.v.) were exported to Italy and elsewhere in the 15th century; this ware is still made to a small extent. Many of the nobles have handsome palaces in the island.

See Bidwell's *Balearic Isles* (1876); the sumptuous *Balearia in Wort und Bild* (5 vols. 1869-84), anon., but by Archduke Ludwig Salvator; and G. W. Wood, *Letters from Majorca* (1889).

Majority is the age at which a person acquires the status of a person *sui juris*—i.e. is able to manage his or her own affairs. This age in the United Kingdom is twenty-one. Under that age persons in England and Ireland are called infants, and are more or less subject to guardians, who manage for them their property. See INFANT.

Majuba Hill, situated in the extreme north of Natal, was the scene of the defeat of 648 British troops, with the loss of their leader, Sir George Colley, by a greatly superior force of Transvaal

Boers on 27th February 1881. The night before, after an eight hours' climb, they had occupied the hill, which overlooked the enemy's position at Laing's Nek, and which towards noon was unexpectedly carried by a rush of the Boers. Their loss was 1 killed and 5 wounded; of the British, 85 killed and 122 prisoners (many wounded), besides some missing. See Sir W. Butler's *Life of Colley* (1899).

Makart. HANS, Austrian painter, was born at Salzburg on 28th May 1840, studied under Piloty at Munich (1861-65), and after visiting Italy settled in Vienna in 1869. Ten years later he was appointed professor at the academy in the Austrian capital, and there he died on 3d October 1884. He painted grandiose spectacular and historical genre pictures, gorgeous with colour and of gigantic size; but the drawing and modelling were frequently faulty, and the treatment nearly always sensuous and voluptuous to a degree. Another strong characteristic of his work is a love for lifeless forms, with the look of death and of the grave upon them. His brilliant colouring and generally theatrical style of art made his pictures fetch large sums. Amongst the most notable specimens of his brush are 'Amorettes,' 'Entrance of Charles V. into Antwerp'—the nude female figures in which were portraits of well-known Viennese ladies (a fact that gave rise to much scandal)—'Cleopatra on the Nile,' 'The Five Senses,' 'The Seven Deadly Sins,' 'Diana hunting,' 'Summer,' and 'Spring.' See *Life by Von Lützow* (1886).

Makkari. AHMED EL., Moorish historian, was born at Makkara near Tlemcen, in Algeria, about 1585, travelled in Morocco, and in 1618 made the pilgrimage to Mecca. This he subsequently repeated five times, besides seven pilgrimages to Medina, and two to Jerusalem. At Damascus he created an enthusiastic impression by his preaching in 1627. His chief residence, however, was at Cairo, where he died in 1631.

His principal work was his *History of the Mohammedan Dynasties of Spain*, partly translated into English by Gayangos (2 vols. 1840-43), and edited by Dozy, Wright, and others under the title of *Analectes sur l'Hist. et la Litt. des Arabes d'Espagne* (Leyden, 1855-61, and also printed at Bülak, 1862). See Wustenfeld, *Die Geschichtschreiber der Araber*.

Mako, a market-town of Hungary, on the Maros, 19 miles ESE. of Szegedin. Pop. 30,063.

Makololo, a tribe of Basutos (q.v.) who, under their chief Sebituane and his son Sekeletu, founded an extensive kingdom in the basin of the Upper Zambezi; but a successful rebellion by the conquered tribes broke up the kingdom in 1864, since which time the Makololos have ceased to exist as a people.

Makrizi. TAKI-ED-DIN AHMED EL., the most eminent of the Arabic historians of Egypt, was born 1364 A.D. at Cairo, but derives his surname from his family's residence at Makriz, a suburb of Baalbek in Syria. He studied theology and jurisprudence under the best teachers; made the pilgrimage to Mecca in 1385; and held various official posts, as secretary of state, inspector of the markets (1398), preacher, reader, and lecturer at several mosques and colleges at Cairo, and (1408) curator of the Kalansiya and the Nuriya hospital at Damascus. Returning to Cairo, he devoted himself to the historical studies which have made him renowned, and after a second pilgrimage to Mecca (1430-35) he died at Cairo in 1442 at the age of seventy-eight.

He wrote sixteen works, besides smaller memoirs, of which the following are the most important: *The Khitat, or History and Topography of Egypt and Especially Cairo*, printed at Bülak (2 vols. 1853), but never completely translated, a work of the highest importance to

historians and archaeologists; a general history from 1181 to 1440, of which a part has been translated by Quatremère as *Histoire des Sultans Mamlouks* (2 vols. 1837-44); biographies of famous men who lived in Egypt, unfinished and unpublished; a treatise on Mohammedan coins, translated by De Saey (1797), and another on Mohammedan weights and measures, edited by Tychsen (1800); *History of Hadramaut*, edited by Noskowsky (1866); *Arab migrations to Egypt*, edited by Wustenfeld (1847); the Mohammedan kings of Abyssinia, edited by Rink (1790). See De Saey, *Christ. Arabi*, i. 112; Wustenfeld, *Die Geschichtschreiber der Araber*.

Malabar, a district (5765 sq. m.) on the south-west coast of India, in the Presidency of Madras, extending from 10° 15' to 12° 18' N. lat. Pop. (1891) 2,652,565, over two-thirds Hindus, and one-fourth Mohammedans. The surface is occupied in the east by the Western Ghats, which send down numerous rivers to the coast, many of them navigable for some distance. There are large forests. Rice is the staple crop; cocoa nuts are largely grown, and also coffee and pepper. The name of this district is applied to the whole south-western coast of Southern India.

Malacca, or MALAY PENINSULA, anciently known as the GOLDEN CHERSONESE, the long strip of land extending from Indo-China south and south-east towards Sumatra. The peninsula begins geographically at the head of the Gulf of Siam, and thus includes part of Siam proper and the British province of Tenasserim in Burma; but it is usual to limit the name to the portion south of the river Pakshan, the frontier of Tenasserim. In the larger sense Malacca extends from 13° 30' to 1° 16' N. lat., and its area is 75,000 sq. m., of which 40,000 belong to Siam, and the remainder to the Straits Settlements (q.v.) and their dependencies, the protected states. The width varies from 44 miles at the isthmus of Kra (q.v.) to 210 at Perak. The interior consists mainly of magnificently-wooded mountain-ranges, disposed parallel to the long axis of the peninsula, some of whose peaks attain a height of 6000 to 7000 feet (Mount Riam is at least 8000 feet), while along the coast there are mangrove swamps, half-a-dozen miles deep, backed by low fertile plains reaching to the mountains. Amongst the more valuable of the trees are ebony, camphor, teak, sandalwood, cinnamon, rattan, cocoa, areca, and other palms, nutmeg, &c. The rivers are short and of little use for navigation. A double belt of islands runs along parts of both coasts. The peninsula is the richest tin-yielding region in the world (see TIN). The tin ore occurs in conjunction with gold and silver, both extracted; iron and coal exist, the former in great quantity, but neither mineral is worked. The forests and mountains shelter numerous varieties of wild animals, as the tiger, rhinoceros, tapir, elephant, hog, buffalo, monkeys, &c., and many beautiful birds. The climate is pretty uniform all the year round. The low districts are hot and moist, and neither they nor the highlands are healthy for Europeans. Rain falls on 190 days in the year. The thermometer ranges from 70 to 90 F. Pop. 1,200,000-800,000 in British territory and dependencies. They are mainly Siamese in the north, civilised Malays (q.v.) along the coast and in the south, and uncivilised Malays, mixed with aboriginal Negrito tribes, in the interior. The crops chiefly cultivated are rice, sugar cane, cotton, tobacco, yams, latata, and cocoa and areca nuts. Politically, Siam extends as far south as 5° 30' on the west coast, and to 4° on the east coast, and includes the tributary states of Ligor, Senggora, Patani, Kelantan, Tringgama, and Kemaman. The southern portion embraces the British settlements Penang, Malacca, and Singapore, all treated in separate articles, and the protected states Perak, Selangor, Sungei

Ujong, the Negri Sembilan states, Pahang and Johore, for which see JOHORE and STRAITS SETTLEMENTS; Mrs Bishop's *Golden Chersonese* (1883), Keane's *Malay Peninsula* (1887), and Guillemaud's *Malaysia* (1895); and Rathborne's *Camping in Malaya* (1898).

Malacca, part of the Straits Settlements, is situated on the south-west coast of the Malay Peninsula, 100 miles from Singapore, and is 42 miles in length, and from 8 to 25 broad. Area, 659 sq. m.; pop. (1891) 92,170. The coast-lands are flat and swampy, and produce rice; inland there are low hills. Besides rice, the chief products are tapioca, pepper, fruits, &c. Tin is mined and exported. Tapioca is the only other export of value. The imports average £610,000 annually, the exports £570,000 approximately. The mean annual rainfall varies from 68 to 91 inches. The town of Malacca, capital of the settlement, is situated in 2° 1' N. lat., 102° 14' E. long., at the mouth of a small river, and consists of the old Dutch or European town and the Chinese and Malay town on the other (left) bank of the river. The church of Our Lady dei Monte was the scene of the labours of St Francis Xavier. Pop. 20,000.

Malacca was taken by the Portuguese under Albuquerque in 1511, and flourished as one of the great emporiums of Indo-China; but it was subsequently supplanted by Penang, and Penang by Singapore. Malacca became a Dutch possession in 1641, and fell in 1795 into the hands of the British, who restored it to the Dutch in 1818; but they returned it to Britain in 1824.

Malacca, STRAIT OF, separates the Malay Peninsula on the north-east from the island of Sumatra on the south-west, and connects the Indian Ocean with the Chinese Sea. Length, 480 miles; breadth, varying from 30 miles at the south-east to 115 miles at the north-west extremity. On this strait are the British settlements of Malacca, Penang, &c.

Malachi (probably an abbreviated form of *Malachiyyah*, meaning 'messenger of Jehovah'; the LXX. and Vulgate have *Malachias*), the name given to the last book in the prophetic section of the Old Testament canon. Regarding its author nothing is known. It has even been doubted whether Malachi is a proper name or only an appellative ('my messenger' or 'Angelicus'), many authorities both in ancient and in modern times favouring the latter view, and thinking that some such writer as Ezra, or even some supernatural person is meant. But although Malachiyyah does not actually occur anywhere in the Old Testament, there is nothing to make it impossible as a proper Hebrew name. The book consists of a series of reasoned remonstrances against prevailing laxity in religious and social conduct, the points brought chiefly into prominence being the bringing of defective offerings to the altar, irregularity and evasion in payment of tithes, mixed marriages and unjustifiable divorces, a spirit of scepticism as to the divine cognisance of human actions and as to the reality of moral distinctions, the practice of witchcraft, sovery perjury, oppression. Warning is given of the approaching judgment, when Jehovah himself, preceded by the angel of the covenant, shall come to cleanse the sinful community by the removal of those who have been found unfaithful. It is the priests who are primarily addressed, and the community which they lead is that of 'Judah and Jerusalem'; both circumstances, combined with the reference to the pasha or governor, show that the prophecy belongs to the Persian period. Some have assigned it to the governorship of Nehemiah, but in view of Neh. v. 14 *seq.* this is improbable; its date is to be sought rather in the interval

between his two terms of office, or after the close of the second—possibly many years after. It is usual to speak of the style of Malachi as marking the transition from the age of the prophets to that of the scribes, as having little of the freedom and fire of the older period, and as tending to the artificiality of formal scholastic disputation. Yet its dialogue is not without dramatic force; and relatively to its size the little book has contributed an unusually large number of memorable phrases and bold and striking figures to the language and thought of Christendom. For commentaries on Malachi, see the works on the minor prophets mentioned under HOSEA. There are monographs by Poccoek (1677), Reinke (1856), Koehler (1865), Sanger (1867), Lange (1876), and Pusey (1877).

Malachite, a mineral, essentially a carbonate of copper, of a green colour, occurs generally massive, with a globular reniform, botryoidal or stalactitic surface; frequently fibrous and showing irregular bands of colour; sometimes earthy in texture. More rarely it is met with crystallised in rather oblique four-sided prisms, bevelled on the extremities, or with the bevelling planes truncated so as to form six-sided prisms. It is valuable as an ore of copper, although seldom smelted alone, not only because it is found along with other ores, but because the metal is apt to be carried off with the carbonic acid. It is sometimes passed off in jewellery as turquoise, although easily distinguished by its colour and much inferior hardness. It is used for many ornamental purposes; slabs of it—chiefly from the mines of Siberia—are made into tables, mantel-pieces, &c. of exquisite beauty. In 1835 a mass of solid malachite was found in the Ural Mountains of more than 17 feet in length, and weighing about 25 tons. By the ancients it was used as a charm to protect infants from witchcraft and sorceries.

Crystal of Malachite.

Malachy, ST. Archbishop of Armagh, and the greatest of St Patrick's successors, was born about 1095 at Armagh, and was brought up at the university or school there under the anchorite Inar. About 1119 he received orders, and went to study theology at Lismore, where he was confirmed in his preference for the Roman over the old Celtic system. In 1121 he became abbot of Bangor. Archbishop Celsus, who had made him his vicar, procured his election to the see of Connor (1125), and on his deathbed (1129) recommended him as his successor in the primacy. It was not, however, till 1134 that Malachy could establish himself therein, and, that done, he withdrew three years later to the see of Down, though retaining the virtual headship of the Irish Church. In 1140 he journeyed to Rome, seeking the pallium, and Innocent II. appointed him papal legate for Ireland. On his way out, and again on his way back, he visited St Bernard at Clairvaux, and returned to Ireland (q.v., p. 210) with four Cistercian monks. In 1148 he once more repaired to France, to renew to Eugenius III. his request for the pallium; but before his arrival the pope had gone back to Rome, and at Clairvaux, on All Saints' Day, 1st November, Malachy died of a fever in St Bernard's arms. He was canonised by Clement IV.

The curious 'Prophecies of St Malachy' were first published in his *Lignum Vitæ* (Venice, 1595) by the Flemish Benedictine, Arnold Wion, who deemed them a recent forgery. They consist of 111 Latin mottoes, forecasting as many pontiffs from 1143 to about 1996. The first 74 (down to 1590) are 'almost without exception,' says Lord Bute, 'transparent indications of the individuals

to whom they apply. In the case of Urban VI. the very family name, Pagnani, is given (*De inferno Pagnani*); and the overwhelming majority of the others are simple puns or plays upon the Christian name, the origin or native place, the previous employment, or the coat-of-arms. The last are extremely frequent, though—unless to a prophet—Heraldry (q.v.) was unknown in 1413. The thirty-seven forecasts after 1590, as a rule, are strangely vague in contrast to their predecessors, and have sorely taxed the ingenuity of students of prophecy. Still, it cannot be denied that there are a few good shots—none better than *Rastrum in portâ* ('the rake at the gate') for Innocent XII. (1681), who was one of the Pignatelli of Rastello at the gates of Naples. Then *Peccariâs Apostolicus* fits nicely for Pius VII., and *Aquila rapax* for Pius VIII., carried off to France by Napoleon, whose emblem was an eagle. For Pius IX. the motto was *Cœus de cruce*, and *Lumen in Cœlo* for Leo XIII., his arms bearing a fiery star. The nine prophecies still unfulfilled in 1890 were *Ignis ardens*, *Religio depopulata*, *Fides interrita*, *Pastor angelicus*, *Pastor et navita* (this shepherd will belike make a voyage), *Flos florum*, *De medietate lunæ*, *De labore solis*, and *Gloria olivæ*. After which 'the City of the Seven Hills shall be destroyed.'

See St Bernard's *Vita Malachie* (in Migne's *Pate. Cursus*, clxxi. 1074); Prof. G. T. Stokes's *Lecland and the Celtic Church* (2d ed. 1888); and, for the 'Prophecies,' Moreri's *Dict. Historique* (ed. 1759); vii. 117, and an admirable article by the Marquis of Eute in the *Dublin Review* for October 1885.

Malacology (Gr. *malakos*, 'soft'), a name sometimes employed to designate that branch of natural history which has *molluscs* (called *malakia* by Aristotle) for its subject. See MOLLUSCA.

Malacopterygii ('soft-finned'), a term applied by Cuvier to those Bony Fishes (q.v.) in which the dorsal fins are supported by soft, jointed rays.

Malaga, a seaport in the south of Spain, is situated on the Mediterranean, 65 miles N.E. of Gibraltar. Sheltered on the north and east by mountains, and with a wonderfully equable and uniform climate (range of thermometer 56° to 82° F.), of which dryness and constant sunshine are the characteristics, this place is superior as a resort for invalids to any either in France or Italy, not excepting the Riviera. The only noteworthy buildings are the cathedral (1528-1765), which is still unfinished, and the Moorish castle, built in the end of the 13th century on the site of a former Phœnician stronghold. Malaga is one of the most important commercial seaports of the kingdom. Yet its trade has been rapidly declining since 1878. Diseases have ravaged the vines and the orange and lemon groves; and heavy octroi duties, unscientific methods of agriculture and of extracting olive-oil, and insufficient and expensive means of communication have all contributed to cause the depression. Nevertheless, olive-oil, wine, raisins, lead, almonds, lemons, grapes, chick peas, and esparto grass are exported to the annual value of £1,953,000, and cotton, timber, coal, petroleum, sugar, and codfish are imported to the annual value of £474,000. The United States, the great customers for Malaga raisins, now use California raisins instead; the export of raisins from Malaga to the States has consequently decreased from 1,000,000 boxes in 1882 to a few thousands in 1895. The harbour, which is entered by 2400 vessels of 1,025,000 tons annually, one-sixth being British and three-fourths Spanish, is protected by two large moles. The manufacturing industry is more hopeful and energetic; it includes establishments for making cotton and linen goods, machinery, fine art pottery, flour, soap, lithographed work, and

wine and oil presses. Pop. (1887) 134,016. The *Malaca* of the Romans, the town is a very ancient place, having been founded by the Phœnicians. It was an important city under the Moors, being first subject to Cordova and afterwards to Granada, from the conquest of Spain early in the 8th century down to 1487, when it was captured by Ferdinand and Isabella.—The modern *province* of Malaga has an area of 2836 sq. m., and a pop. (1887) of 523,627. One-sixth is planted with the vine, and two-fifths yield wheat, barley, and maize. Lead, iron, and manganese are mined.

Malagasy. See MADAGASCAR.

Malakoff. See SERASTOPOLE.

Malan, CESAR HENRI ABRAHAM, a Protestant Swiss divine, was born in Geneva, 8th July 1787, and became a pastor of the state church and a regent in the college. Through the influence of American and Scottish friends, he became devoutly evangelical, and many of his works were translated into English—*The Church of Rome* (1844), *Stories for Children* (1852), *Pictures from Switzerland* (1854). Both words and music of *Chants de Zion* (1826) are his own. He died 8th May 1864. His *Life* was written (1869) by his son Solomon Cesar, D.D. who, born at Geneva in 1812, studied at Oxford, and was vicar of Broad Windsor and prebendary of Sarum. He wrote on birds, and several theological works, and died 27th November 1894. See *Life* by his son (1897).

Malaprop. Mrs. a character in Sheridan's *Receils*, whose remarks are not so much out of place or *mal-à-propos*, as ingeniously perverse in 'derangement of epitaphs'—i.e. in confounding and misapplying words somewhat similar in sound or spelling—a 'Derbyshire putrefaction,' 'a barbarous Vandyke,' 'an allegory on the banks of the Nile.'

Malapterurus. See ELECTRIC FISHES.

Mälär, LAKE, one of the largest lakes, and the most beautiful, in Sweden, measures 80 miles in length from east to west, and has numerous long narrow arms and offsets; area, 650 sq. m. It is studded with upwards of 1200 islands, mostly well wooded. Its east end is close by Stockholm, where its waters are poured into the Baltic Sea. The shores are very varied with bays and hills, woods, lawns, and cliffs, and are adorned with many castles, country-seats, and villas, including the royal palaces of Drottningholm and Gripsholm.

Malaria, or Miasm. Malaria, an Italian word, is almost universally employed to designate an earth-born poison which is generated in soils the energies of which are not expended in the growth and sustenance of healthy vegetation. This emanation gives rise to certain diseases, especially the various forms of intermittent and remittent fever. During the past three hundred years some two thousand books and papers have been written upon the subject, but as yet, although much is known of malaria, it is impossible to state definitely what the morbid agent really is. Many theories have been advanced with regard to malaria. It has been said to be due to a parasite, to a germ, to some telluric origin which the French call telluric intoxication, to the toxic excretions of living organisms, plant or animal. Some say it is caused by chill, others by certain electrical conditions of the atmosphere, and others say it is due to a gas emitted from marsh water. Although malaria is so often connected with marshy districts as to lead many to suppose that a marsh must be inseparably connected with its production, yet we find that, although it is most powerful near marshes, it is also found in arid regions and in rocky districts which are in a state of disintegration. Its geographical distribution is very wide, but it is most

virulent in tropical and subtropical regions. Its dependence on climatic influences is shown by the prevalence of malarial fever at certain seasons and under certain meteorological conditions; even in those districts where malaria is endemic throughout the whole of the year there is a maximum and minimum period to its virulence. It is certain that a high temperature is capable of increasing the frequency and severity of malarial fever; and that in those places where the summer temperature is from 58° to 60° F. the production of the poison is prevented. The influence of the rainfall varies with the character of the soil. As a general rule it may be said that the malarial poison is most virulent either when the rains set in after a long period of heat, or when the rains cease and give place to warm dry weather. The virulence of the poison is notably diminished at the height of the rains if they are very abundant, but the poison is produced in greater quantities in wet than in dry years. Wind exerts a certain influence upon malaria, for it can carry the poison from a marsh to a healthy spot, probably to the distance of three miles; wind also prevents the vertical ascent of the poison, for in calm air malaria may ascend to 700 or 1000 feet above a swamp, but should a strong wind be blowing this vertical diffusion is prevented. It is also probable that on some islands where malaria is absent, although from analogy we should expect to find it present, the wind by rapidly changing the atmosphere carries away the poison before it has time to do harm. The extent and severity of malarial diseases diminish as one ascends above sea-level. The height at which malaria is produced depends upon climatological conditions—i.e. in tropical districts one must ascend to a greater altitude to find a situation free from malaria than would be necessary in a northern climate. In the tropics an altitude of 3200 feet may be required to prevent the production of malaria, whereas in the Apennines 1500 feet only is required, and farther north malaria is not found at a greater altitude than 500 feet. In investigating the occurrence of malaria in non-mountainous regions we also find that altitude plays a not unimportant part, for even on a level plateau with basin-like depressions the deepest points are those most affected by disease, and in those exceptional cases where malaria is endemic at more or less considerable elevations the seat of the production of the poison is invariably in a valley or ravine. The older geological formations are more or less exempt in proportion to the compactness of the rock and the porosity of the soil, and accordingly the alluvial and diluvial formations are the chief seats of endemic malaria. Clay, marl, and marsh lands are most favourable to its production; a porous chalky soil is less favourable, and sandy soil least favourable to its production. Where malaria is endemic in rocky districts there is always a more or less thick layer of permeable alluvial, diluvial, or mineral detritus spread over the firm rock, and invariably a hygroscopic upper soil.

Whatever the character of the soil, a copious saturation of the ground is necessary for the production of malaria. This may be caused by atmospheric precipitations, drainage from rivers, lakes, or pools, inundations, either periodic or irregular, irrigation, and saturation of the ground with subsoil water. The amount of organic matter in the soil is certainly connected with the production of malaria, and, other circumstances being equal, the greatest amount of malaria will be found where the amount of organic matter in the soil is greatest, least where it is least. Changes in the soil indicate clearly its influence on the production of malaria, for the latter will

disappear on damp or marshy soil being completely dried up. If water completely covers the soil, malaria disappears; if virgin land be reclaimed, it proves malarious until perfectly cultivated, and a neglect of once cultivated ground may also produce malaria. It has been found by experience that malaria is not produced in the centre of cities, and, although it may be prevalent in the outskirts of large towns, it does not penetrate to their centres.

Laveran discovered the parasite of malaria; Bignami, Grassi, and others insisted (1899) that the malady was mainly communicated by mosquitoes; and Major Ross made extensive researches in West Africa into the theory, singling out the *Anopheles gambiae* as especially active. Professor Koch's investigations (1899-1900) in Italy, Java, and New Guinea prove that the true home of the germ is in the blood of the malarial patient; mosquitoes and other gnats, imbibing the germ in stinging a sufferer, introduce it into the blood of the next person stung. In New Guinea nearly all children are afflicted with malaria. Much may be done to combat the disease by special attention to children, and to mild and latent cases in adults. In Germany cases of malaria in the army, which in 1865 were 13,500, were in 1895 only 230; doubtless owing to the free use of quinine. Ross insists on the possibility (denied by Koch) of exterminating mosquitoes by surface drainage. Dr Sambon and Dr S. Low, who were commissioned by the British Government, spent the malarial season (July to October) of 1900 in the worst parts of the Roman Campagna; they found that people who only go about during the day, when these insects do not appear, and who protect themselves from them at night, when they are abroad in myriads, do not suffer from malaria; whereas the sting of a mosquito was invariably followed by the disease. See ENDEMIC and the monograph by Celli (trans. 1900).

Malatia (anc. *Melitene*), a town in the province of Diarbekir in Asia Minor, 8 miles from the Euphrates; pop. 20,000.

Malay Peninsula. See MALACCA.

Malays, the dominant native race in the Eastern Archipelago and neighbouring Asiatic peninsula, which from them are commonly named respectively the Malay Archipelago and Malay Peninsula, and collectively Malaysia. Physically the Malays must be regarded as an oceanic branch of the Mongolic division of mankind, diversely modified by interminglings, especially with dark (Papuan) elements in the eastern, and light (Caucasic) elements in the western and central parts of the archipelago. The former (*Malayo-Papuan*), often designated by the somewhat vague term 'Alfuro,' merge gradually eastward through Timor, Ceram, and South Jilolo in the true Papuans of Aru and New Guinea. The latter form two distinct groups, the *Indonesians* showing more of the Caucasoid, and the *Malays proper* showing more of the Mongolic element. The Indonesians, represented chiefly by the Battaks and Kubus of Sumatra, the Bughis and Mangkassaras of South Celebes, the Buled Upihs and others of Borneo, the Manobos and Tinguians of the Philippines, the Mentawey islanders (west coast of Sumatra), and many of the tribes in the Moluccas (North Jilolo, Bnn), are of medium and even tall stature, well proportioned, with light brown complexion, long (dolichocephalic) head, straight eyes, large nose, and regular features. The Malay race proper comprises all the rest of the inhabitants of Malaysia, except the Negritos of the Philippines and Malay Peninsula; also the Chams of the south-eastern extremity of Cochinchina, many of the Formosan tribes, the Hovas of Madagascar, and some of the Micronesian islanders.

They are of low size, averaging little over five feet, with yellowish complexion, straight black hair, round (brachycephalic) head, somewhat almond-shaped eyes, small nose, high cheek-bones, flat features, small hands and feet, in general so like the east Asiatic Mongols that Chinese dressed as Balinese could scarcely be distinguished from Malays, while many natives of Java might pass very well for Chinese (Wallace).

But linguistically the Malays are entirely severed from the Asiatic Mongols, all the Malay languages without exception belonging to the widely diffused Malayo-Polynesian family, which extends across the Indian and Pacific Oceans from Madagascar to Easter Island, and from New Zealand northwards to Hawaii. This area includes many dark populations, such as the natives of the New Hebrides and Solomon Islands, who speak primitive or archaic forms of the organic Malayo-Polynesian tongue, of which the standard Malay, Kavi, Javanese, and other idioms of the more cultured Malay peoples appear to be later developments (Codrington). Thus in the oceanic world race and language are, so to say, antagonistic, and present many difficult problems, the solution of which must await further research.

The peoples of standard Malay speech—i.e. the Malays in the narrower and popular acceptance of the term—occupy a comparatively limited portion of Malaysia, being mainly confined to the Malay Peninsula to about 9° N. lat., the southern provinces of Sumatra (Menangkabo, Palembang, &c.), Lingen, Banca, and the other islands between Sumatra and Borneo; Banjarmassin, Pontianak, Brunei, and some other maritime districts in Borneo; Tidor, Ternate, and the Banda group in the Moluccas, and the Sulu Islands. But at all events since the 13th century these Malays have been the chief trading people of the archipelago, where their language was already the general medium of intercourse throughout Malaysia at the arrival of the Portuguese towards the close of the 15th century. The question of their origin has been much discussed, some fixing the cradle of the race on the Asiatic mainland, others in Sumatra. This island, and especially Menangkabo, was undoubtedly the point of dispersion of the later historic migrations both to the mainland and to the eastern parts of the archipelago, which migrations can be traced back to the 12th century. But the race itself, being a branch of the Mongolic stock, must have originally reached the islands from the mainland, where the *Orang-Benua* ('men of the soil'), indigenous Malay tribes, are still found almost at as low a stage of culture as their Negrito neighbours. Others, the so-called *Orang-Laut* ('men of the sea'), have from times long anterior to the Sumatran migrations been scattered over all the inland waters of the archipelago, 'a vile people, living by fishing and piracy' (De Barros). Lastly, the *Orang-Melayu* themselves—i.e. the civilised Malays, formerly Brahmanists and Buddhists, now mostly Mohammedans—had already overrun the southern parts of Annam in the 8th century, and the Hovas had reached Madagascar at a still earlier epoch—i.e. before the spread of Hindu influences in the archipelago, for there are no Sanskrit words in the Malagasy language. Hence the Menangkabo dispersion can only be regarded as an episode in the history of the Malay race, whose origin must be sought, not in Sumatra, but in the Indo-Chinese peninsula. Their connection with the primitive inhabitants of this region is also shown by numerous practices, such as pile building, head hunting (Dyaks of Borneo), certain matriarchal customs, a dislike of milk, and fondness for putrescent fish, large ear ornaments, cock-fighting and other forms of gambling.

Of late years the Malays have mostly abandoned their lawless roving habits, and are now spoken of as a somewhat mild, patient, and taciturn people, occupied chiefly with trade and agriculture, and distinguished especially for their extreme courtesy towards each other and strangers. But the old fiery spirit still smoulders beneath an apparently passive exterior, and too frequently reveals itself in those sudden outbursts of murderous frenzies known as 'running amuck.' The Malay intellect is of a low order, and the race has never developed a native culture, their civilisation being entirely due to foreign influences, chiefly Hindu and Arab. The Malay language, which is soft and harmonious and of simple structure, is written in the Arabic character, which is ill suited for the purpose. Lately the Roman system has been largely adopted, especially in the Dutch and English dependencies. The literature, which is copious, comprises poetical compositions, such as rhyming proverbs, love-songs, and dramas displaying some originality, but little imagination. The prose-writings (histories and chronicles in which truth and fiction are inextricably interwoven, treatises on law, theology, and ethics) are mostly based on Arab or Persian models.

Malcolm, SIR JOHN, G.C.B., a British soldier, statesman, and historian, was born at Burnfoot, near Langholm, Dumfriesshire, May 2, 1769, and at fourteen went to India as a cadet in the Madras army. In 1798 he was appointed assistant to the resident at Hyderabad by Lord Wellesley. He distinguished himself at the siege of Seringapatam in 1799, and in 1800 he was sent as ambassador to Persia, to form an alliance with that country against Bonaparte, in which he succeeded. In 1801 he acted as private secretary to Wellesley; in 1803 was appointed governor of the Mysore Residency; and during the next two years did much to reduce to order and tranquillity the newly-conquered Mahratta states. In 1807 and 1810 he was again sent as minister-plenipotentiary to the Persian court. In 1812 he returned to England, received the honour of knighthood, and, after five years, went out again to India as the governor-general's political agent in the Deccan, and with the rank of brigadier-general in the Indian army; in the latter capacity he greatly distinguished himself in the wars against the Pindaris and Holkar. He was again in England in 1822, and settled with his family at Hyde Hall, near Sawbridgeworth, Hertfordshire. To this period belong his anonymous *Sketches in Persia* (1827). Governor of Bombay (1827-30), he entered parliament in 1831 as member for Lauceston, and opposed the Reform Bill. He died of paralysis in London, 30th May 1833. The Duke of Wellington in 1824 wrote to Malcolm that from the year 1796 'no great transaction has taken place in the East in which you have not played a principal, most useful, conspicuous, and honourable part.' Malcolm's writings are *A History of Persia* (2 vols. 1815; 2d ed. 1828), *Memoir of Central India* (2 vols. 1823), *Political History of India from 1783 to 1831* (2 vols. 1826), and *Life of Lord Clive* (1836). See his *Life and Correspondence*, by Kaye (1856).

Malcolm Canmore (Clak, *Cannmore*, 'great head'—king of Scotland, was a child when in 1040

his father, King Duncan, was slain by Macbeth (q.v.). He seems to have spent his youth in Northumbria with his uncle, Earl Siward, who in 1054 established him in firm possession of Cumbria and Lothian. In 1057, on the death of Macbeth and (seven months later) of Lulach, as well as that probably of Earl Thorfinn of Orkney, he ascended the throne of all Scotland. For the first eight years he was free to devote his energies to the consolidation of his kingdom, England then being ruled by the peaceful Edward the Confessor; but even during this period he made one raid into Northumbria (1061). And after 1066 the history of his long reign is one of ceaseless warfare with the Norman. His first wife, Ingibiorg, Thorfinn's widow, had died; and in 1069 Malcolm wedded Margaret, sister of Edgar the Atheling (q.v.), whose cause therefore he warmly made his own. Five separate times did he harry Northumbria, as far sometimes as York (1069, 1070, 1079, 1091, and 1093); and there were counter-invasions by William the Conqueror and Prince Robert, in 1072 and 1080, on the former of which occasions at Abernethy King Malcolm came and made peace with King William, and gave hostages and became his man. This homage he renewed to William Rufus in 1091; but, according to Scottish historians, it was only for Lothian and Cumbria, which once had belonged to England. In 1092 Rufus wrested from Scotland all Cumbria south of the Solway; and next year Malcolm gathered his army and marched into England, harrying with more animosity than ever beloved him. And then, on 13th November 1093, Robert de Mowbray, Earl of Northumberland, ensnared him at Alnwick with his men unawares and slew him. Morel of Bamborough, who slew him, was Earl Robert's steward and King Malcolm's gossip. With Malcolm, also, was slain his son Edward, who should, if he had lived, have been king after him. Malcolm left, however, five sons, of whom four succeeded him on the throne—Duncan (by Ingibiorg), Edgar, Alexander, and David. His reign is an important one, as the commencement of the transition of Scotland, Celtic and Culdee, to Scotland, feudal and Roman Catholic; but the change was not due to him so much as to his saintly queen.

See the article MARGARET, and Skene's *Celtic Scotland* (1876); and see the article SCOTLAND for the other three kings of that name—Malcolm, son of Donald, king of Alban from 942 to 954; Malcolm, son of Kenneth, king of Scotia from 1005 to 1034; and Malcolm the Maiden, king of Scotland from 1153 to 1165.

Maldegem, a town of East Flanders, Belgium, 12 miles by rail E. of Bruges. Pop. 8522.

Malden, a village of Surrey, 3 miles SE. of Kingston-upon-Thames. From 1264 to 1274 it was the seat of Merton College, so may claim to be the metropolis of Oxford. Pop. of parish, 525. The town of New Malden (pop. 2538) is 2 miles E. of Kingston, of which it is practically a suburb.

Malden, a town of Massachusetts, 5 miles by rail N. of Boston. There are manufactures of india-rubber goods, cords and tassels, sand-paper, &c. Pop. (1890) 23,031.

Malden Island, a British possession in the Central Pacific, lies NW. of the Marquesas in 4° 3' S. lat. and 155° W. long. It is a coral island 5 miles long by 1 broad, and has valuable deposits of guano, worked by eight Europeans and 160 native labourers.

Maldive Islands, a chain of characteristic Coral (q.v.) atolls in the Indian Ocean, lying SW. of Ceylon. They extend 550 miles in length (7° 7' N. lat. to 0° 12' S.) by 45 in average breadth (72° 30' to 73° 50' E. long.), and consist of seventeen

groups, distributed politically into thirteen, and embracing a total of several hundred islands. All of these are very small in area, and less than 200 are inhabited. Male, the residence of the native 'Sultan of the Twelve Thousand Isles,' is 1 mile long by $\frac{2}{3}$ mile wide, and contains a pop. of 2000. The population of the whole chain is probably not more than 20,000. These people resemble the Singhalese in their personal appearance, and speak a language closely akin to Singhalese. They are Mohammedans by religion, and boast of an ancient civilisation. They are peaceful, affectionate, well behaved, and of cleanly habits. Rice (imported), fish (chiefly bonito), bread-fruit, cocoa-nut, and various other fruits and vegetables are their principal food. Coir, cowries, dried bonito fish, cocoa-nut and copra, and tortoiseshell are exported. The gathering and preparation of these articles are the principal occupations, apart from a little weaving. The Arab geographer Ibn Batuta lived more than a year on the islands (1343-44). The Portuguese maintained factories there at various times after 1518; but in 1645 the sultan put himself under the protection of the Dutch governor of Ceylon, and along with that island they exchanged Dutch for English supremacy. The sultan sends an embassy every year, bearing presents, to renew his homage to the governor of Ceylon.

Maldon, a municipal borough of Essex, 9 miles E. of Chelmsford and 38 NE. of London (by rail 44), stands on a hill near the confluence of the Chelmer and the Blackwater, in the vicinity of which traces are still extant of a Roman encampment. It has two fine churches, partly Decorated and partly Perpendicular, and a quaint town or moot hall dating from the reign of Henry VI. The manufacture of crystallised salt is a speciality, and in the Blackwater—a noted resort of wild-fowl—are extensive oyster-fisheries. From 1328 to 1867 Maldon returned two members to parliament, and thence to 1885 one. Plume, founder of the professorship of Astronomy at Cambridge, General Gates, and J. R. Herbert, R.A., were natives, and Landseer's parents residents till 1815. In the battle of Maldon (991), the subject of a famous old English poem, the English under Brihtnoth were defeated by Norwegian Vikings under Guthmund and Olaf Tryggvason. Pop. (1801) 2358; (1881) 5468; (1891) 5397. See Fitch's *Maldon and the River Blackwater* (1895).

Malebranche, NICOLAS, a French philosopher, was born August 6, 1638, at Paris. He was deformed and sickly, and from his childhood fond of solitude. At the age of twenty-two he entered into the congregation of the Oratory, and devoted himself to the study of Patristics and church history, till Descartes's treatise, *De Homine*, falling into his hands, attracted him to philosophy. His famous work, *De la Recherche de la Verité* (3 vols. 1674; 6th ed. 1712), revealed great depth and originality of thought combined with perspicuity and elegance, its object being the psychological investigation of the causes of the errors to which the human mind is liable, and of the nature of truth and the way of reaching it. He maintains that we see all things in God, his famous *Vision en Dieu*; that all beings and thoughts exist in God—*Dieu est le lieu des esprits, comme l'espace est le lieu des corps*; and that God is the first cause of all changes which take place in bodies and souls, which are therefore merely passive therein. His system is a kind of mystic idealism. It was immediately opposed by Ant. Arnauld, Bossuet, and many others, and was subjected to a thorough and critical examination by Locke and Leibnitz. Other works of Malebranche's are *Traité de la Morale* (1684) and *Conversations*

Metaphysiques et Chrétiennes (1683), in the latter of which he endeavoured to exhibit the harmony of his philosophic views with Christianity. He died at Paris, October 13, 1715. The story of Stock, Berkeley's biographer, that Malebranche died of the excitement induced by a metaphysical discussion with the subtle Berkeley, is disproved by the dates; Berkeley having been in England from August 1714 till 1716.

An edition of his works, published in 1712, filled 11 volumes. Later editions are by Genoude and Lourdoux (1837) and Jules Simon (1850-71). See the Life by André (Tours, 1886), and the Studies by Blampignon (1861), Ollé-Laprune (1870), and Pillon (1895).

Maletuetta Pepper. See GRAINS OF PARADISE.

Malesherbes, CHRÉTIEN GUILLAUME DE LAMOIGNON DE, a distinguished French statesman, was born at Paris, December 6, 1721. Educated at the Jesuits' College, at twenty-four he became counsellor to the parliament of Paris, and in 1750 succeeded his father as president of the Cour des Aides, where he showed clear judgment, strict integrity, and humanity. A quiet but determined opponent of government rapacity and tyranny, he watched the ministry with a jealous eye, and was indefatigable in his efforts to prevent the people from being plundered. Besides his more proper judicial duties he was entrusted also with the censorship of the press, and so tolerant was he that French authors pronounce the period of his censorship 'the golden age of letters.' To his large mind we may ascribe the publication of the famous *Encyclopédie*. In 1771 his bold remonstrances against the abuses of law which Louis XV. was perpetrating led to his banishment to his country-seat of St Lucie, but here he solaced himself with botany, ever a favourite study. At the accession of Louis XVI. (1774) he was recalled, and took office under the crown, but retired on the dismissal of Turgot, and from this time to the Revolution spent his time in travel, or in the improvement of his estates, with one brief interval of office in 1787. The first storms passed him by; but when he heard that the unhappy king was about to be tried by the Convention he magnanimously left his retreat, and came to Paris to undertake his defence. 'I was twice called to the council of him who was my master, when all the world coveted that honour; and I owe him the same service now when it has become one which many reckon dangerous,' said the gray-haired hero. From that day Malesherbes himself was doomed. He was arrested in the beginning of December 1793, and guillotined, April 22, 1794, along with his daughter and her husband, brother of the famous Chateaubriand. Malesherbes was one of the noblest figures of his time, and his fearless, high minded devotion to duty as an advocate was fittingly commemorated in 1826 by a statue in the hall of justice at Paris, and in the name of a well-known boulevard in the city. He was a member of the Academy, and brought an able pen to the discussion of agriculture and botany as well as political and financial questions.

His *Œuvres Choësies* (1809) contains his most interesting writings. For his Life, see the books by Dubois (3d ed. 1806), Gaillard (1805), Bossy d'Anglas (1818), Rozet (1814), Dupin (1814), and Vignaux (1874).

Malet. See MALLET.

Malherbe, FRANÇOIS DE, was born at Caen, July 13, 1555. After studying at the university of Caen he attached himself to Henri d'Angoulême, a natural son of Henri II., and was afterwards pensioned by the Duc de Bellegarde. He joined the court of Henri IV., and received a pension of 1500 livres from the queen. He was an industrious

writer, producing odes, songs, paraphrases, epigrams, epistles, translations, criticisms, &c. He founded a literary school, and by his influence brought about a revolution in poetic style. He gave lessons in composition to a class of disciples, who met in the hotel of the Duc de Bellegarde, and death, so the story goes, struck him while he was engaged in rounding a period. Though he had a considerable fortune, he incessantly bewailed the rigours of his lot in his addresses to the court, and successfully importuned Louis XIII. for an addition to his income. He died at Paris, October 16, 1628. His poetry is of little merit, being cold, colourless, and insipid. He is best remembered by the truly touching stanzas which he addressed to his friend Du Perrier, and which contain the most famous line: 'Et, rose, elle a vécu ce qu'on vivent les roses.' He was exceedingly vainglorious, and asserted that what he had written would endure eternally. His interest lies in this—that by example and teaching he altered the complexion of French verse. He led his countrymen to look with disdain on the richly-coloured and full-sounding verses of Ronsard, and to adopt a style clear and finished, it is true, but cold and prosaic, and confined to the limits of a narrow vocabulary. He delighted to be termed the tyrant of words and syllables. He introduced, so to speak, the principle of caste into diction. Certain words were adapted for poetic purposes, while others were to be rigidly excluded from literature. The result was that when Malherbe's teachings were developed by Boileau, and enforced by his high authority, French verse was deprived of nearly all that marks off poetry from prose. The select literary words lost their original edge and colour, and became incapable of rendering other than conventional ideas. On the other hand, Malherbe did good service in inculcating the virtues of reticence, refinement, and correctness in style.

See *Sainte-Benve's Camerac de Louis*, vol. viii.; Flippé's *Écrivains Normands* (1858); and works by Gournay (1852), Laur (Heidelberg 1869), Johannesson (Halle, 1881), Basset (3d ed. 1890), Allais (1892), and the Duc de Broglie (1896).

Malibran, MARIA FELICITA, mezzo-soprano singer, born at Paris, March 24, 1808, was the daughter of Manuel Garcia, a Spanish singer and teacher of singing. She made her debut in London in 1825, and soon her reputation extended over Europe. Her father attempted to establish the Italian opera in New York, but without success; and she married M. Malibran, a French merchant there, who soon became bankrupt. Thereupon she returned to the stage, and was received with great enthusiasm in France, England, Germany, and Italy. Her first marriage having been dissolved, she married M. Beriot, a famous violinist, in 1836; but on 23d September of that year she died at Manchester. She was one of the greatest of operatic singers.

Malic Acid, $H_2C_2H_2O_3$ (from Lat. *malum*, 'an apple'), occurs abundantly in most acidulous fruits, particularly in unripe apples, gooseberries, and currants, in which it is found as an acid or acid salt of potash or lime, which gradually changes into a neutral salt as the fruit ripens. It crystallises in groups of radiating acicular prisms, but, as the crystals are very deliquescent, it is usually obtained as a syrupy, semi-transparent mass, with a very sour smell, and readily soluble in water and alcohol. The chemical changes which this acid undergoes under the influence of various reagents are very singular, and serve to illustrate many points in vegetable physiology in reference to the maturation of fruits. Thus, nitric acid converts it into oxalic acid; hydrated potash, into oxalic and

acetic acids; ferments, into succinic, butyric, acetic, and carbonic acids and water.

Malignant Pustule. See ANTHRAX.

Malignants, a term used by the parliament men to designate those whom they considered to be the evil advisers of Charles I. They are so called in the Grand Remonstrance, Laud and Strafford being singled out as the most prominent, and to their door are laid all the evils which afflicted the kingdom. Afterwards the name was extended to all who sided with the king against the parliament.

Malines, or MECHLIN (Flem. *Mechelen*), a city of Belgium, on the navigable Dyle, 14 miles SSE. of Antwerp. It has fine squares, noble buildings, and wide regular streets, but is devoid of all signs of life and industry, having lost its former greatness, and fallen far behind other Belgian cities in commercial enterprise and industrial activity. As the see of the primate of Belgium it still retains a certain degree of ecclesiastical importance, and possesses numerous churches, the most noteworthy of which is St Rombold's cathedral, a vast building, covering nearly two acres, its interior adorned with Van Dyck's 'Crucifixion' and many other fine pictures and carvings. It was mostly built in 1437-52, but its clock-tower, 324 feet high, remains unfinished. The churches of St John and of Our Lady contain works by Rubens; the town-hall dates from the 15th century; the Cloth Hall (1340) is now used as a guard-house; noteworthy also are the splendid modern archiepiscopal palace, the Beguinage, the Salm inn (1534), and the monument to Margaret of Austria (1849). The manufacture of pillow-lace, so famous in the 17th century (see LACE), has been largely transferred to Brussels and elsewhere; but linen and woollen fabrics, beer, needles, &c. are made here. Pop. (1875) 49,181; (1889) 49,721.

Malingering is a term used in the British army to express the crime of feigning disease in order to obtain discharge from the service, or to escape some special duty. As defined in the Army Act of 1881 it implies some overt act, such as the previous application of a ligature, or the taking of some drug, which produced the appearance of the disease said to exist. A worse form of the same crime, 'wilfully maiming'—as blowing off the trigger-finger—is erroneously called malingering.

Mallard. See DUCK.

Malleability is the property which certain metals possess of being reducible to thin leaves, either by hammering (hence the corresponding German word, *Hammerbarkeit*) or by lamination between rollers. The order in which the malleable metals exhibit this property is as follows: Gold, Silver, Copper, Platinum, Palladium, Iron, Aluminium, Tin, Zinc, Lead, Cadmium, Nickel, Cobalt. Gold far surpasses all the other metals in malleability, being capable of reduction into films not exceeding the 200,000th of an inch in thickness; and silver and copper may be reduced to leaves of great tenuity. Although gold and silver also present the property of Ductility (q.v.) in the highest degree, there is no constant relation between the two properties; for example, iron, although it may be reduced to extremely thin wire, is not nearly so malleable as gold, silver, or copper.

Mallee Scrub, a bushy Eucalyptus 8 or 10 feet high, which forms impenetrable thickets in Australia (q.v., Vol. I, p. 589). For the Mallee hen, see MOU AND BIRDS.

Mallet, or MALLEY, CLAUDE FRANCOIS DE, a conspirator against Napoleon I., was born 28th June 1751, at Dôle in Franche-Comté, and became an eager supporter of the Revolution.

Entering the army, he had risen to the rank of a brigadier-general by 1799. But in 1801 he was detected in a conspiracy against Napoleon, and again in 1808; he was arrested and kept in confinement until 1812. During Napoleon's campaign in Russia Mallet made his escape from prison on the night of October 22-23, and by circulating the false news of Napoleon's death and by dexterous use of a forged decree of the senate won over some of the national guards. Whilst the latter occupied the principal public offices in his name, Mallet himself proceeded to liberate his fellow-conspirators, Generals Guidal and Lahorie, from prison. But at the house of Hulin, commandant of the troops in Paris, Mallet was himself taken prisoner by Hulin's adjutant, Laborde. He was shot, along with his fellow-conspirators, 29th October 1812. See histories of the conspiracy, by Lafon (1814), Saulnier (1834), and Douville (1840).

Mallet, or MALLOCH, DAVID, the wielder of a venal pen under the second and third Georges, was born about 1705, at Crieff, where his father was a Roman Catholic small farmer. Janitor for six months at the High School, Edinburgh (1717-18), he then studied for one session at the university, and in 1720 became tutor in the family of Mr Home of Dregghorn, in 1723 in that of the Duke of Montrose. Here he remained several years, and made the tour of Europe with his pupils. In 1723 the adaptation of two old ballads into a new one, 'William and Margaret,' gained him a reputation as a poet, which he enhanced by a poem, *The Excursion* (1728). After this, having 'by degrees cleared his tongue from his native pronunciation, so as to be no longer distinguished as a Scot, . . . he took upon him to change his name from Scotch Malloch to English Mallet'—an instance of his insufferable vanity. Strange to say, Pope, the poet, was his friend, and to please him Mallet reviled Bentley in a work in verse, *Verbal Criticism* (1733). About this time he was appointed under-secretary to Frederick, Prince of Wales, then holding a separate court from his father's. In 1740 Mallet published a mediocere life of Bacon, and in 1742 another fairly creditable poem, *The Hermit, or Amyntor and Theodora*. After this he appears in the most despicable character: to gratify Bolingbroke he heaped abuse upon his dear friend Pope in a preface to Bolingbroke's *Patriot King*; at the bidding of the ministry he directed the popular rage for the loss of Minorena upon Admiral Byng, and his reward for this 'price of blood was,' says Dr Johnson, 'a pension which Mallet retained till his death;' and he received a legacy of £1000, besides other sums, to write a life of the great Duke of Marlborough, but never penned a single line—'he groped for materials and thought of it till he had exhausted his mind.' He also tried his hand at play-writing, but with no very great success: *Mustapha* pleased for a while in 1739, because it was thought to contain some political allusions; *Eurydice* (1731) and *Elvira* (1763), tragedies, were failures. *Alfred, a Masque* (1740) was written in conjunction with Thomson, and one of its songs, 'Rule Britannia,' has been claimed for both of them. Besides, Mallet published two volumes of miscellaneous verse. He died on 21st April 1765.

Mallow, a market-town and watering-place of Ireland, is beautifully situated on the left bank of the Blackwater, 20 miles by rail N. by W. of Cork. On the opposite side of the river, which is here crossed by a bridge, is the suburb of Ballydaheen. The town is resorted to in summer on account of its tepid mineral waters, and contains a

neat spa-house. Close by is the ivy-covered ruin of the castle of the Desmonds, destroyed in 1611, and the later Mallow Castle, built by Sir Denham Norreys towards the end of the 18th century. Tanning and some small manufactures are carried on. Pop. (1851) 5436; (1881) 4439; (1891) 4366. Till 1885 Mallow returned one member to the House of Commons.

Mallow (*Malva*), a genus of plants of the natural order Malvaceæ, whose species are herbaceous plants, or more rarely shrubs. The Common Mallow (*M. sylvestris*) is plentiful over most of Europe, and in Britain on waysides and heaps of rubbish. It is a perennial, with rather large

Common Mallow (*Malva sylvestris*.)

bluish-red flowers on erect stalks. The Dwarf Mallow (*M. rotundifolia*), also a common native of Britain, has smaller whitish or reddish-white flowers. These two plants have a mucilaginous and somewhat bitter taste, and the leaves are used as an emollient and demulcent medicine, a decoction of them being employed in cases of irritation of the pulmonary and of the urinary organs; and poultices made of them are very frequently employed to allay external inflammation. Other species have similar properties. The Musk Mallow (*M. moschata*), not infrequent in England, but rare in Scotland, has a faint musk-like smell. The fibre of *M. crispa* is used in Syria for textile purposes, and the fibres of many species are probably fit for similar use, and for the manufacture of paper. The young leaves of some are boiled as vegetables. A Mallow (*Lucatera arborea*) grows on the Bass Rock and Haddingtonshire. The Marsh mallow (q.v.) belongs to another genus.

Malmaison, a château standing on the left bank of the Seine, 10 miles W. of Paris, was the favourite residence of Josephine, wife of Napoleon I., and here she died. The château belonged to Richelieu, and was restored by Napoleon III. in 1861. A sortie by Durot from Paris in 1870 was repulsed here by the Germans. See a work by Lesene (1867).

Malmedy, a Prussian town in a mountain valley, close to the Belgian frontier and 51 miles S. of Aix-la-Chapelle, with mineral springs. Pop. (1895) 4500, mostly Walloons, speaking French.

Malmesbury, an old-world market town of Wiltshire, on a bold eminence between two head-streams of the Avon, 26 miles by rail NNE. of Bath and 17 WNW. of Swindon. It owes its name to Maelduff, an Irish missionary. Abhelm (q.v.), his scholar, became about 673 first abbot of the famous abbey here, in which Athelstan was buried, and of which William of Malmesbury was librarian

and precentor in the first half of the 12th century. To his time belong the building of a short lived castle, and the rebuilding (also by Bishop Roger of Salisbury) of the abbey church, which, Transition Norman in style, and cruciform in plan, with a central spire, was 350 feet long. Little more than the nave—now the parish church—remains; but this is a most interesting fragment, its finest feature the south porch. At the Dissolution (1539) the mitred Benedictine abbey became a cloth factory. A beautiful market-cross (temp. Henry VII.) is noteworthy. Hobbes was a native. Malmesbury returned two members till 1832, and then one till 1885. Pop. of borough (incorporated 1886), 2964.

See works by Moffatt (1805), Sir T. Phillips (1831), J. E. Jackson (1863), W. de Gray Birch (1874), and the *Register of Malmesbury*, edited by Brewer and Martin (2 vols. 1879-81).

Malmesbury, JAMES HARRIS, first EARL OF, diplomatist, was born at Salisbury, 21st April 1746, the only son of James 'Hermes' Harris (q.v.). Educated at Winchester, at Merton College, Oxford, and at Leyden, in 1768 he became secretary of legation at Madrid, and in 1772 minister at Berlin, in 1777 at St Petersburg, in 1784 at The Hague. In 1779 he received the Order of the Bath, and in 1788 was created Baron, in 1800 Earl of, Malmesbury. Meanwhile, in 1793, with other Whigs he had succeeded from Fox to Pitt, and in 1795 had married by proxy and conducted to England the Princess Caroline. 'I'm not well, Harris; get me a glass of brandy, Harris'—one remembers the Prince's reception of his bride. Very deaf during the last twenty years of his life, Lord Malmesbury died in London, 20th November 1820. See his *Diaries and Correspondence* (1844), and *Lord Malmesbury and his Friends* (1870), both edited by his grandson.

That grandson, JAMES HOWARD HARRIS, third EARL OF MALMESBURY, was born in London, 25th March 1807, and from Eton proceeded to Oriel College, Oxford. He took his B.A. in 1827, and then made a continental tour (1828-29), during which at Rome he formed a close friendship with Louis Napoleon. In 1837 he stood as a Tory for Portsmouth, and in 1841 had just been returned for Wilton, when his father's death called him to the House of Lords. In 1852 he was Foreign Secretary under Lord Derby, as again in 1858-59, when his policy prior to the outbreak of the Franco-Austrian war was directed wisely if unsuccessfully to the preservation of the peace of Europe. In 1866-68, and again in 1874-76, he was Lord Privy Seal; in 1884 appeared his valuable and entertaining *Memoirs of an Ex-Minister*. He died 17th May 1889.

Malmesbury, WILLIAM OF, an early English historian, was born near the close of the 11th century, and was educated in the monastery at Malmesbury, where he became a monk, and in due time librarian, and afterwards precentor. In 1140 he declined the office of abbot, took part in the council at Winchester against Stephen in 1141, and died most probably soon after 1142, when his latest work, the *Historia Novella*, comes abruptly to an end. His two principal works are *Gesta Regum Anglorum* and *Gesta Pontificum Anglorum*. The former gives the history of the kings of England from the Saxon invasion to the twenty-eighth year of Henry I., or the year 1128. The *Historia Novella* brings down the narrative to the year 1142, but is really a separate work. Sir T. D. Hardy edited both together for the English Historical Society in 1810. Sharpe's translation (1815) was included in Bolin's 'Antiquarian Library' in 1847. The two form admittedly one of the most valuable authorities for the Anglo-Norman period of our

history, the work of a man of great learning, industry, intelligence, and impartiality—no mere compilation, and written moreover with unusual clearness and force. The *Gesta Pontificum* gives an account of the bi-shops and principal monasteries of England from the conversion of Ethelbert of Kent by St Augustine to 1123. It was edited in the Rolls series in 1870 by Mr N. E. S. A. Hamilton. Other works of William's are an account of the church at Glastonbury, printed in Gale's *Scriptores* XVI., and a life of St Dunstan, printed in Wharton's *Anglia Sacra*.

Malmö, the third largest town of Sweden, on the Sound, nearly opposite Copenhagen, 17 miles distant. Besides being a busy seaport, it has manufactures of cigars, sugar, beer, and woollens, and some shipbuilding. The exports (chiefly grain, flour, butter, eggs, cement, chalk, matches, live-stock, and timber) are carried away every year in about 3500 vessels of 750,000 tons burden, and the imports (coal, machinery, cotton, grain, textiles, coffee, &c.) brought by 3600 vessels of 720,000 tons. The only remaining part of the old fortifications is the castle in which the Earl of Bothwell (q.v.) was confined: it is now used as a prison. The town-house is a fine Renaissance building of 1546. Pop. (1874) 30,676; (1888) 46,283. Down to the 16th century Malmö was one of the busiest commercial towns in that part of the Baltic. In 1523 a treaty of peace between the Danes and Gustavus Vasa was signed here.

Malmsey (Fr. *vin de Malvoisie*), a name bestowed originally on the red and white wines of Napoli di Malvasia or Monemvasia, in the Morea, not because it produced them, but because it exported them: they were grown in the islands of the Egean and the Levant. The Malmsey wines of modern commerce are mostly the produce of Teneriffe, Madeira, the Azores, Sardinia, Sicily, and one or two other places.

Malone, EDMUND, editor of Shakespeare, was born in Dublin, 4th October 1741, graduated with credit at the university there, and was called to the Irish bar in 1767. Falling soon after into a fortune, he went to London to devote himself to literary pursuits, his first work being a 'supplement' to Steevens's edition of Shakespeare (1778). His contributions to Steevens's third edition of Shakespeare (1785) led to a serious quarrel between the two, in which Steevens was wholly to blame. Malone's own edition of the great dramatist (1790) was warmly received, especially the essays on the 'History of the Stage' and the 'Genuineness of the Three Plays of Henry VI.' As an editor Malone displays great good sense, conscientiousness, much acuteness, extensive research, and a becoming respect for the text of the earlier editions. He had been one of the first to express his unbelief in the antiquity of Chatterton's Rowley poems, and in 1796 he denounced the impudent forgeries of the wretched Ireland. Next year he published a posthumous edition of the works of his friend Sir Joshua Reynolds. His own death occurred 25th May 1812. He left behind a large mass of materials for another edition of Shakespeare, which at length appeared in 1821, in 21 vols., under the editorship of James Boswell the younger, and as the 'Variorum Shakespeare' is known and valued by all scholars. See Life by Sir James Prior (1860).

Malory, SIR THOMAS, is immortal in his work, the *Morte Darthur*, while of himself but little is known. We learn from Caxton's preface that Malory was a knight, that he finished his work in the ninth year of the reign of Edward IV. (1470), that he 'reduced' it from some French book, and that he was a servant of Jesus both day and night—a statement which has needlessly led to the

inference that he was a priest. In Leland's *Itinerary* the name occurs in Yorkshire, and the century after in Burton's *Description of Leicestershire*, but there is no evidence to connect the writer with either county. Caxton's impression was finished in 1485, and is a black-letter folio, of which but two copies now exist. An accurate and altogether admirable edition of it was reprinted in 1889 by the care of Dr H. Oskar Sommer. The editor's Introduction followed in 1890; his Treatise on the Sources and Andrew Lang's Essay on Malory's Prose Style in 1891. There were twelve preceding editions, including those of Wynkyn de Worde, W. Copland, Hazlewood (1816), Southey (1817), Thomas Wright (1856), and Sir E. Strachey (the Globe edition, 1868). The last three have admirable introductions.

Sir Thomas Malory's work 'is indisputably,' says Scott, 'the best prose romance the English language can boast of.' It was due to an attempt to work up and give an epic unity and harmony to the whole mass of French romance, and the result shows that its author was no slavish copyist or compiler merely, but that he turned much that was dross into pure gold, and stamped upon the whole the impress of his own individuality as Shakespeare did with his Holinshed and Plutarch. And this no less in the events than the characters of the story as the modern reader realises them glorified through the medium of Tennyson's stately verse. The story moves forward with dignity to its tragic close, the inevitable issue of the guilty loves of Lancelot and Queen Guinevere.

Malpighi, MARCELLO, an Italian anatomist, was born at Crevalore, near Bologna, on 10th March 1628, and died at Rome on 29th November 1694. He held, at different periods of his life, the professorship of Medicine in Pisa (1656-60), Messina (1662-66), and Bologna (1666-91). In 1691 he was appointed chief physician to Pope Innocent XII. Like his contemporary Leeuwenhoek, he was a pioneer in the study of minute anatomy with the microscope, and is chiefly known for his discoveries in connection with capillary circulation and in the anatomy of the skin, the kidney, and the spleen (see KIDNEYS). Amongst his works may be mentioned *Epistola Anatomica* (1662), *De Structura Viscerum* (1669), *De Pulmouibus* (1661), *De Structura Glandularum Conglobatarum* (1689), and *Anatomia Plantarum* (1675-79). See the bicentenary monograph by Atti, Virchow, Haeckel, Todaro, Michellis, and others (Milan, 1898).

Malpighiaceae, a natural order of exogenous plants, trees or shrubs, many of them climbing shrubs or lianas.

Malplaquet, a village in the French department of Nord, 10 miles S. of Mons in Belgium. Here, on 11th September 1709, over 90,000 British and Dutch, under Marlborough and Prince Eugene, defeated about the same number of French under Marshal Villars. In this 'very murderous battle,' as Marlborough called it, the loss of the allies was from twenty to thirty thousand, of the French from six to sixteen thousand. Its result was the capture of Mons.

Malström. See MAELSTROM.

Malt and Malting. See BEER.

Malta, an island and British possession in the Mediterranean, 17½ miles long by 8½ broad, with an area of 95 sq. m. It stands on the submarine plateau which, stretching across from Sicily to Africa, divides the Mediterranean into two basins, and is of late Eocene or perhaps Miocene formation, the prevailing rocks being limestones. From its central position in the Mediterranean Sea, 58 miles S. of the Sicilian coast and about 180 SE. by

E. of Cape Bon in Algeria, and from the enormous strength of its fortifications. Disraeli called it 'the little military hothouse'—Malta is one of the most important of the British dependencies. It is the headquarters of the British Mediterranean fleet, the principal coaling station for merchant-vessels as well as the navy in the Mediterranean—between 500,000 and 600,000 tons of coal are imported for use and re-exportation annually—a powerful stronghold (Valletta), a valuable sanatorium for troops employed in the Orient, and an interesting island historically, architecturally, and from the antiquarian standpoint. The dependencies include the island of Gozo (20 sq. m.), lying NW. of Malta, and separated from it by a channel 3 miles wide, in which are the little islands of

Comino and Cominotto, and several islets round the coasts of the larger islands. On one of these islets, General's Rock, near the west side of Gozo, the famous Maltese fungus *Cynomorium* (q.v.) grows. The area of the entire governorship of Malta extends to 117 sq. m. The island of Malta is oval in shape, the north-eastern and eastern shores being broken into several good harbours (Valletta, Marsa Scirocco, St Paul's Bay, Mellieha Bay, &c.); the southern coast rises in picturesque cliffs 400 feet high. The culminating point of the island is 758 feet. The sea has hollowed out among its cliffs grottoes and caverns in almost every direction, some of considerable extent, especially one in Comino. Malta has a bare, stony appearance, owing to the absence of trees and the fact that the fields and gardens are enclosed in high walls, to shelter the crops against the violent winds. There are no rivers or lakes; but water is easily obtained from springs. The soil is thin, but remarkably fertile; and its fertility is increased by the skilful cultivation and the diligent toil of the inhabitants. Large crops of wheat and potatoes are raised, early varieties of the latter being largely exported to England; maize, barley, cotton, clover, oranges, figs, grapes, earob beans, and peaches and other fruits are also grown. Fine honey is produced; in spring the island is gay with flowers. Those of the Maltese who do not cultivate the soil are chiefly engaged in the docks and harbours. Filigree ornaments and a little cotton are manufactured. Sheep and goats are kept, with smaller numbers of cattle, mules, asses, and horses. The Maltese Dog (q.v.) is virtually extinct. During the summer months the thermometer ranges from 75 to 90° F., during the coldest from 59 to 71.

The annual mean is 67.3 F., and the annual rainfall 24.23 inches. But when the hot sirocco wind blows—not dry as in Africa, but laden with moisture—the climate is enervating. Otherwise Malta is fairly healthy, though cholera pays occasional visits, as in 1853 and 1887; since about 1880 the government have been providing the island with a comprehensive system of water-works, which has greatly contributed to its healthfulness. Earthquakes are relatively frequent.

In 1881 Malta (132,129) and Gozo (17,653) contained 149,782 inhabitants; in 1891, 177,225 (including 2300 British residents and 1200 foreigners, but excluding the 6000 to 7000 imperial troops). The local militia, including the Royal Malta Fencible Artillery, number about 1200. The language of the people is a corrupt dialect of Arabic, with a strong admixture of Italian and other words; some authorities, however, connect it with the ancient Phœnician. The native population believe themselves to be of Phœnician descent. From the time of the settlement of the Knights of St John down to quite recently Italian was the official language; but it has been superseded by English. Most of the educated Maltese speak Italian, and some speak English; the peasantry as a rule know neither the one nor the other. The Maltese are a sober, industrious race of people, though often quick-tempered and ignorant. Their thrifty habits are proved by the fact that 5197 depositors had £402,969 standing to their credit in the savings-bank in 1888. They are fond and proud of their island home—they love to call it 'the flower of the world'—and are devout Roman Catholics, the power of the Church being very great over the people. There are two bishops (Malta, Gozo) and 1200 clergy. Canon law is recognised as the civil law of Malta. Owing to the rapid growth of the population and their density to the sq. m. (1471 in Malta and 931 in Gozo; Belgium has 514 to the sq. m.), large numbers are compelled to emigrate; they are found to the number of 50,000 in all parts of North Africa and the Levant. Education is provided for in a university, a lyceum (400 pupils), and nearly fifty government schools, attended by 10,000 pupils. The university, founded in 1769, has four faculties and (1888) 105 students. The educational condition of the island had long been a subject of discontent; but reforms were introduced in the end of 1887, after which the number of students at the university more than doubled, and a thousand more pupils attended the primary schools. Yet other causes of discontent existed in the ecclesiastical jealousy of the predominant church, and social jealousy between the impoverished native nobility (for the most part counts and marquises created by the Knights of St John, and fully recognised since 1878) and the upper classes of the British. Within the last few years the sovereign power has shown more consideration for the political susceptibilities, and also for the social welfare, of the people. The fortified towns that constitute Valletta have been drained, water has been carried throughout Malta, and in 1890 was to be carried over Gozo likewise, and the old Maltese coinage of the knights was superseded (1887) by the British currency (silver being legal tender up to £5). Moreover, a constitution based on popular representation was conferred in 1887. Legislation is carried on by six official and fourteen elected members, the governor, with the power of veto, being president. There is also an executive council, consisting of the governor as president, seven official members, and three nominated by the governor from among the elected members of the legislative chamber; the crown retains the right to legislate also through orders in council. There is no direct taxation in Malta.

The government own two-sevenths of the land (the rest is divided about equally between the ecclesiastical establishments and private owners); from the rents of this and other crown property, and from customs, licenses, &c., the annual revenue of £260,000 to £300,000 is derived. The public debt is £80,000 (1895). There is a railway, 8½ miles long, connecting Valetta (q.v.), the present capital, with the old capital Citta Vecchia, known to Cicero as Melita, to the Saracens as Medina, and to the modern Maltese as Notabile, a place founded so long ago as 700 B.C. Here is the cathedral of St Paul (1697), traditionally occupying the site of a palace of Publius, who erected there a church, and of a former cathedral built by the Normans in the 12th century and destroyed by earthquake in 1693. The cathedral is adorned with mosaics, pictures, statues, and other works of art. Near by are the extensive catacombs and the Grotto of St Paul, where he is popularly believed to have lived during his three months' stay on the island. Two miles distant is the Verdala Palace, built by the grand-master Verdala in 1586, and now a summer residence of the governor of the island. At Mnaidra and Hagiar Kim, in the south of the island, there are megalithic Phœnician temples, the ground-plans, not only of the general structures, but also of the detailed compartments, being all elliptical in shape. The traditional scene of St Paul's shipwreck is on the north side of the Bay of St Paul. The church of Musta (1833-64) is designed on the model of the Pantheon at Rome, and has the largest dome in Europe next after those of St Peter's and the Pantheon. Some 8000 vessels of 6,000,000 tons enter and clear the island ports every year, with cargoes varying in value from £25,000,000 to £70,000,000. But of the total imports (worth nearly £36,000,000 in 1891, in 1894 hardly £14,000,000) only a fraction—say £800,000—is actually retained in the island; the rest is re-exported.

The *Hyperion* or *Ogygia* of Homer is sometimes identified with Malta. The Phœnicians colonised the island at a very early date, more than 1000 years before the birth of Christ. Before they were disturbed in their possession by the Greeks, about 700 B.C., they had developed considerable commerce. The Greeks, who called the island *Melita*, were driven out by the Carthaginians about 480 B.C. As early as the first Punic war Malta was plundered by the Romans, but did not come definitively into their hands until 216 B.C. In those early times Malta was renowned for its manufactured cotton, its roses, and its honey; and its Roman temples and villas boasted excellent works

of art and other indications of great luxury. On the division of the Roman world (395) Malta followed the fortunes of the eastern empire. During the 5th century it fell successively under the Vandals and the Goths; and though in 533 Belisarius recovered it for the Byzantine empire, its prosperity departed, and its civilisation almost vanished amid constant local feuds. In 870 the Arabs destroyed the Greek power in Malta, and fortified the harbour. Count Roger of Sicily drove out the Arabs in 1090. As a tief of Sicily, Malta passed, under a marriage-contract, to the Emperor Henry VI. (1194). In 1282 the island was conquered by Pedro of Aragon, and, so coming eventually into the hands of Charles V., was given by him, along with Gozo and Tripoli, in perpetual sovereignty to the Knights of the Order of St John of Jerusalem (1530). The Knights raised the stupendous fortifications which rendered Malta so powerful, and spent much wealth in beautifying the island. To revenge their attacks on the Barbary pirates, Sultan Solyman sent in 1565 a very powerful fleet, strengthened by the galleys of Dragut of Tripoli, against the forts. Valetta was founded in the following year, after the Turkish attack, which lasted three months, had been beaten off (see VALETTA). In 1571 the Maltese followers of the Knights of St John behaved courageously at the battle of Lepanto. The Hospitallers continued in possession of Malta until 1798, when they surrendered their fortresses to the French. The Maltese, however, rose in a few months against their new masters, who treated them ill, and after a siege of two years, during which they were assisted by Neapolitan and British forces, they forced the French to capitulate to the English general Pigot. The treaty of Amiens stipulated that Malta should be restored to the Knights of St John; but the Maltese protested against such an arrangement, and preferred the government of Great Britain. The British government consequently refused to give up the island, and Napoleon made the refusal one of his grounds for the resumption of hostilities. The Congress of Vienna (1814) finally recognised Malta as a British dependency.

See historical works on Malta by Miège (1840), Eton (1802), Ayles (1830), Tullack (1861), Winterberg (1879); Caruana's *Reports on Phœnician and Roman Antiquities in Malta* (1881-82); James Smith, *Voyage and Shipwreck of St Paul* (1866); Sir R. L. Playfair, *Mediterranean* (1890), in Murray's Guidebook series; and John Murray's valuable paper in *Scot. Geog. Mag.* (1890).
